

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

taining size, price, and description of upwards of 100 articles, consisting  
of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes,  
Writing-desks, Dressing-cases, and other travelling requisites, forwarded on  
receipt of two stamps.

Allen's Registered Despatch-box and Writing-desk, their Travelling-bag  
(with the opening as large as the bag), and the new Portmanteau, containing  
four compartments, are the best articles of the kind ever produced.  
J. W. and T. ALLEN, Manufacturers of Portable Furniture, and  
Military Outfitters, 18 and 23, Strand.

**H. Silverlock's Medical Label Ware-**  
house, LITHO-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING  
OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at  
H. Silverlock's establishment they will find every kind of Label they  
can possibly require; and also that every description of Engraving, Letter-  
press, Copper-plate, and Lithographic Printing is executed by competent  
workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent  
per post on application.

**Do you Bruise your Oats yet?—**

MARY WEDLAKE'S Oat-bruilers, 23 15s. 6d.; ditto, 24 15s. 6d.  
Chaff-cutters, 23 7s. 6d.; ditto, 24 10s. 6d. Domestic Flour-mills, for home  
use, 24 10s. 6d.—A saving on Oats of 35 per cent. Terms Cash.  
118, Fenchurch-street, London.

No one can equal them for cheapness or durability. Ten thousand have  
found their way into the most eminent horse-masters' stables, particularly by  
medical men, with unexpected advantage to the owners.  
Book on Feeding, 1s.

**Novelty in Bedsteads, adapted for**

the Nursery, Sick Chamber,  
Sitting-room, and Drawing-  
room.

HAMMOND'S ORIENTAL  
OTTOMAN forms a Bedstead  
for one or two persons at a  
moment's notice. Price, mat-  
tressed complete, 35s.—the  
most complete article ever  
introduced to the public.—

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14,  
High Holborn. Designs forwarded on receipt of a postage-stamp.

RUPTURES.—BY ROYAL LETTERS PATENT.

**The Moc-Main Lever Truss is**

allowed by upwards of 200 Medical Gentlemen to be the most effectual  
invention in the curative treatment of HERNIA. The use of  
a steel spring, so often hurtful in its effects, is here avoided;  
a soft bandage being worn round the body, while the requisite  
resisting power is supplied by the MOC-MAIN PAD and  
PATENT LEVER fitting with so much ease and closeness  
that it cannot be detected, and may be worn during sleep. A  
descriptive circular may be had, and the Truss (which cannot  
fall to fit) forwarded by post, on the circumference of the body  
two inches below the hips being sent to the Manufacturer,  
MR. WHITE, 233, Piccadilly, London.

**ELASTIC STOCKINGS FOR VARICOSE**  
VEINS, and all cases of Weakness and Swelling of the Legs,  
Sprains, &c. They are porous, light in texture, and inexpen-  
sive, and are drawn on like an ordinary Stocking. Price from  
7s. 6d. to 16s.

MANUFACTORY—228, PICCADILLY, LONDON.

**Cocoa-nut Fibre Matting and Mats,**  
of the best quality.—The Jury of Class 23, Great Exhibition, awarded  
the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-  
hill, London.

**The Royal Turkish Towels.—Under**

the Patronage of her Majesty the Queen, and which received the Prize  
Medal at the Great Exhibition. The Brown Linen combines the advantages  
of a Flesh-brush with the qualities most desirable in a Towel; the white  
Cotton is the softest Towel ever made, and absorbs moisture without the  
necessity of using friction.

To be had of all respectable Linendrapers.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s.,  
made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant  
Tailor, 74, Regent-street.—A perfect fit guaranteed.

**D. Condon, Court, Military, Naval,**

Clerical, and Lay Tailor, 2, New Bond-street.

RIDING HABITS, LIVERIES.

ONE GUINEA DRESS TROUSERS.

**To Professional Men and others.—**

The Oxford Mixed Doeskin Trousers, price 31s. The Stratus Cloth  
Vest, price 10s. 6d. Stock for choice, or to measure.  
S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, four  
doors south of Schoolbred and Co's.  
Patterns of the material and Directions for Measuring sent free per post.

**Whypay more than Sixteen Shillings**

for your TROUSERS?—MILES, of 62, New Bond-street, has the pleasure  
to inform the ready-money public his Show Rooms are replete with all the new  
Patterns in SCOTCH ANGOLAS, for Spring and Summer wear, at 16s. per  
pair. No connexion with any other house. Gentlemen are requested to note  
the address. Patterns and directions for self-measurement forwarded on  
application. Orders must be accompanied by post-office orders.

**Notice.—Berdoe's Ventilating**

WATERPROOF LIGHT OVER-COATS resist any amount of rain,  
without confining perspiration, the fatal objection to all other waterproofs,  
air-tight materials being unfit and dangerous for clothing; being free from  
vulgar singularity, are adapted for general use, equally as for rainy weather.  
Price 46s. and 60s. A large stock for selection, also of Capes, Shooting Jackets,  
Ladies' Mantles, Habits, &c.

W. BERDOE, Tailor, &c., 90, New Bond-street, and 60, Cornhill (only).

**A Thoroughly Good Fitting Garment**

INDISPENSABLE.—To those who have been pestered with badly-  
cut garments, J. SANDS begs to state that, having had great experience in  
studying the human form, he will engage to fit the most difficult figure or  
please the most fastidious taste. In passing his Establishment, 17, HOLBORN  
HILL (opposite Furnival's Inn), it will be seen that every peculiarity of style  
is consulted, both in price and pattern. Dress and Frock Coats from 85s. to  
70s.; Black Dress Waistcoats, from 8s. 6d. and Trousers from 21s. Fancy  
Clothing and Juvenile Dresses in great variety.

**To all who cannot get a Fit; the**

importance of which requires no elucidation to convince the most  
sceptical how indispensably necessary it is to health, comfort, and appearance.  
R. T. PIGRAM, while wishing to avoid the present system of putting, adopts  
this means of making known his SELF-ACTING INDICATOR the HUMAN  
FIGURE. An invention can only be estimated by its results: a trial will not  
only give satisfaction, but will justify in favouring R. T. P. with their recom-  
mendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s  
Service, can obtain every requisite for a complete Outfit, made with due regard  
to comfort, elegance, durability, and correctness of regulation, at a great re-  
duction from the usual charges, at

L. PHILLIPS, 23, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United  
Kingdom. Patronised by the Lords of the Admiralty and the principal  
Medical Officers of the three Services. Detailed lists of the articles required  
on taking up a Commission, with prices affixed, on application.

**Rice Harris and Son, Islington**

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT,  
LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADERS.—  
These Shades, manufactured exclusively by RICE HARRIS and SON, on an  
entirely new principle, effectually destroys the effluvia and smoke, which have  
hitherto made the use of gas so objectionable in dwelling-houses and offices,  
where cleanliness and freedom from smell are of importance. They are  
simple and inexpensive, and may be had in a variety of forms adapted to the  
style of fittings or the taste of the purchaser, at the Works in Birmingham,  
and at Mr. JOHN SHORTER'S, Crispin-street, Spitalfields, London.

**Railway Travellers, and all persons**

suffering from weakness, should obtain one of W. S. SPARKS' newly-  
invented URINALS, for night and day use, for both male and female. They  
are made on the most approved principles, so as to prevent any unpleasant-  
ness, are very durable, and at prices within the reach of all. W. S. also  
manufactures all articles in India-rubber and gutta-percha for invalids,  
including bed-pans, sheeting, water and air cushions, pillows and mattresses,  
heating-tubes, portable baths, elastic bandages, stockings, knee-caps, &c. &c.  
Water-beds on sale or hire. The medical profession, hospitals, and country  
dealers supplied on the best terms, and circulars, &c. forwarded on applica-  
tion.—W. S. SPARKS, India-rubber Manufacturer, 115, New Bond-street.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place, Pall Mall, London.

PATENT SELF-ADJUSTING TRUSSES.

## Salmon, Ody, and Co., most respect-

fully inform the Public, that their Patent Self-adjusting Trusses afford more ease and security for the relief of HERNIA than any other instrument for the purpose. They will answer for right or left side, requiring no under-strap or any galling bandage. Persons in the country are requested to send the circumference of the body one inch below the hips.

CAUTION.—As many mercenary druggists are vending an inferior article, purchasers are requested to observe that SALMON, ODY, and CO., 292, Strand, London, is marked upon the leather case.

Sold by one or more druggists in every city and principal town in the United Kingdom.

TO SURGEONS.

## Messrs. Shoolbred & Bradshaw beg

to call the attention of Medical Gentlemen to their PATENT ELASTIC STOCKINGS, KNEE-CAPS, SOCKS, &c. The particular property of the Stocking is to give constant support in varicose veins, weak, swollen, or dropsical affections of the leg, or in any case requiring constant and equal pressure. The Knee-Cap will be of great use where the knee-joint requires support from accident to the pan of the knee, after inflammation, rheumatic, or gouty affections. The Stock affords great support to the ankle-joint after fractures and dislocations, or in any case where, from weakness of the part, support may be necessary. Suffice it to say, wherever common bandages are necessary, the Patent Elastic Instrument will beneficially supersede their application, as they yield an equally diffused pressure over the part affected.

To be had of the Patentees, 34, Jermyn-street, St. James's, London.

## Asthma, Chest, and Throat Affec-

TIONS.—Immediate Relief and Effectual Cure by Markwick's Patent 2s. 6d. Respirator, Chest Protector, &c.

GOUT, RHEUMATISM, and LUMBAGO.—For a speedy Cure, use Markwick's Patent Filine Gout Socks and Gloves, Knee and Shoulder Caps, Lumbago Bands, &c.

SHOE SOCKS, of Markwick's Patent Filine, surpass every other for comfort; being waterproof, you are also protected against damp.

MARKWICK'S PATENT SPONGIO-PILINE POULTICE or FOMENTATION, is invaluable for its extraordinary efficacy, easy application, cleanliness, and durability.

G. TRIMBEY, sole Manufacturer, Queen-street, Cheapside, London. Sold retail by all respectable Chemists and Druggists.

## Scientific Professional Apparatus,

manufactured and sold by HORNE, THORNTON, and WOOD, 121 and 123, Newgate-street, London, who invite attention to the following articles, which have given universal satisfaction:—

MEDICAL ACHEOMATIC MICROSCOPES, in Case, for Anatomical Urinary Deposits, &c., £2 10s., £2 5s., and upwards.

ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism of great quantity, and of the only form and construction suitable for Medical Application, in portable Case, £3 3s., £5 5s., and £8 8s.

URINOMETERS, gilt metal, 14s.; glass, 4s. 6d. In Case, for pocket, with Thermometer, Acid, &c., 21s. and 35s.

APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY. In Cases, £3 3s., £5 5s., and £10 10s.

\*.\* Any required information and price-lists forwarded on application.

TO THE SURGICAL AND MEDICAL PROFESSION.

## W. F. Durroch, late Smith, begs to

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Durroch, for John Hilton, Esq., may be had at a moderate price.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.

GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	98,500	£ 3,439 0 1
1852	677	278,955	10,808 12 2
1853	1025	413,785	15,838 3 6

## MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTRODUCTION.

EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality, Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Crotyleodon Umbilicus, &c.) also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietaria (diuretic), and Liq. Bala (prepared from the Egie Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BAEI on hand.

2, Edwards-street, Portman-square.

## Shower and all Domestic Baths.—

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECURRENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

## Evans's Patent Shower Baths, Warm

and Cold Baths, Slipper, Leg, Hip, and Foot Baths, Sponging and Douche Baths, and Baths of every description, combining all recent improvements, and every variety of shape and pattern; Garden Rollers, Garden Engines, and Horticultural Tools, Scythes, Shears, Sprayers, and Garden Requisites in general; also a variety of new pattern Garden Seats, Chairs, &c.; Tea and Coffee Urns, Percolators, and machines of new and elegant designs, combining all the recent French and English improvements; Paper Mache Teatrays and Waiters, Table Cutlery, Plated Ware, Patent Dish Covers, and every article for the kitchen, always on show at JEREMIAH EVANS, SON, and CO'S Stove, Grate, and Cooking Apparatus Manufactory and Warehouses, 33, King William-street, London-bridge.

## ZOONOMIA;

OR,

## THE LAW OF ANIMAL LIFE.

## A Lecture

DELIVERED AT

THE SMITHSONIAN INSTITUTE, WASHINGTON, D.C., U.S.,

ON MARCH THE 8TH, 1853.

By MARSHALL HALL, M.D., F.R.S., &amp;c.

GENTLEMEN,—I congratulate myself on the opportunity afforded me, by your kind invitation, to unfold a principle in physiology on which I have long meditated and experimented, and which I have ventured to designate the Law of Animal Life.

Many have been the attempts to define *life*. All have, I think, proved abortive. I shall not, in my turn, venture to attempt that in which so many have failed. My object will be rather to describe than to define.

Life, then, may be justly viewed as consisting in a comprehensive system of action and re-action;—of the action of certain physical and chemical influences, and the re-action of certain vital powers in organized beings.

Throughout the animal, and indeed the vegetable, kingdoms, the *primary* organic agents and re-agents are *pollen* and *ova*. Life first consists in the reciprocal action of these upon each other. Such is the very type and essence of life in its earliest dawn. Harvey said, *Omne vivum ab ovo*; he might, with equal truth, have said, *Omne vivum a polline*; and, with still greater truth, *Omne vivum a polline, et ovo*.

Each of them—the pollen, the ovum—was originally a *creation*. Their mutual and reciprocal action is a phenomenon which the Creator has impressed on this portion of His works as the *fact* of His will.

That this action is perfectly reciprocal is proved by the resemblance of the new being or offspring—be it animal or vegetable—to *both* parents. The event is at present as inscrutable in its nature and essence, as it is interesting to the physiologist and philosopher as a subject of observation and new inquiry.

Why this seed of the *Triticum Indicum*, or Indian corn, on which pollen has fallen, should, if planted in soil, and exposed to the genial influences of heat and moisture, become a noble and useful plant; and why this other, to which, from its mode of growth and treatment, no pollen has been allowed to have access, shall, under similar circumstances and influences undergo decay and decomposition, who can tell? Why *this* egg, which has been fertilized by pollen, should, under similar genial influences, become a bird, and eventually soar into the regions of the atmosphere; and why this other, unaffected by pollen, should pass into a state of putrefaction, who can declare? Who will attempt to explain why those “divine particule auree,” which exist in the form of pollen, can alone vivify these ova? Who can say *what* there is in these ova, and *what* there is in the appropriate pollen—for the two are *equally essential*—which develop growth, and form, and life?

Look at these ova and at these seeds. On *this* ovum, and on *this* seed, no pollen has ever been shed. They will, though placed in circumstances the most favourable for development, only pass the more readily into decay. But this other ovum, this other seed, on which pollen, life-giving pollen, has shed itself, will, under similar circumstances, germinate and pass into life, the whole subsequent being becoming expressly imbued with the equally inscrutable properties of the pollen, and of the ovum or seed.

What is the condition of this pollenized, this fructified ovum or seed, *before* active life begins? Is life in *abeyance*? Or is it in *actual existence*, only in its lowest and imperceptible form? Have eggs and seed a temperature of their own, above that of the medium in which they are placed? And what is

No. 1610.

the condition of this *offset* of an animal or animalcule, (as the planaria,) or of this plant? Both will continue to live independently of the original stem. Both may be multiplied and propagated by new and similar offsets. Both are, as I have stated, equally imbued with the properties of both the original pollen and ovum. All this is mysterious, inscrutable in its essence, constituting one of the arcana of organic nature, which may long, may for ever, be hidden from us.

But the *laws* of life, and those of the material and inorganic world, may be detected; and their detection and investigation are amongst the most legitimate, interesting, and important objects of philosophical inquiry. At present, I beg only to state, that whilst pollen places the ovum or seed under *vital* influences, its absence allows them to become the prey of mere physical or chemical agencies alone.

The further essential and distinctive characteristic of organized beings, that in which they differ from the objects of the inorganic world, is—*membrane*. Through this membrane, a special function of transition takes place, constituting endosmosis and exosmosis, or imbibition and exudation.

If this membrane be injured or broken down, the materials of organized beings are again immediately subtracted from the laws of organization, and delivered over to the ordinary principles of chemical action—decay or *ereimacausis*—from which that membrane had preserved them, whilst it placed them under the dominion or modification of vital influences. Examples of this fact are afforded by bruises of animal or vegetable tissues, which, if slight, are repaired by the vital powers; but if severe, lead to death or decay. How extraordinary are the changes which almost immediately take place in bruised flesh, or in a bruised orange or apple!

But I must hasten from these preliminary views, and pass on to the more express subject of this lecture. All living beings, from the serpent to the eagle, possess, in common, peculiar *dynamic* properties; in all, these properties respond to appropriate external and internal *stimuli*. On the reciprocal play, action and re-action, of these forces and agents, life, with all its varied phenomena, in all its varied forms, essentially depends.

These dynamics and these stimuli bear a relative proportion to each other. This proportion is *inverse*; the higher the dynamic, the lower the stimuli, and *vice versa*. Such is—the *Law of Animal Life*.

In the animal kingdom two forms of dynamics exist. The first has its seat in the nervous system, or, more definitely, in the spinal and ganglionic sub-systems: I venture to designate it by the term *neuro-dynamic*. The second has its seat in the muscular system; it may be designated *myo-dynamic*. The stimuli exist in greater numbers, for they consist in physical and chemical agents of the external world, such as air, food, water, heat, light, the galvanic influence, &c.

I must introduce the subject of the vital dynamics by showing those who are not familiar with physiology an experiment full of the deepest interest. I place before you a frog, prepared for the purpose; and you will observe how the most elevated principles of philosophy may be illustrated by what you may deem the humblest objects of creation. The physiologist knows and feels that his science, elevated as it is, is included in the most insignificant insect that lives—the caterpillar or the butterfly.

The nervous system consists in *three* sub-systems: the first is that of which the brain, or cerebrum, is the centre, and sensation and volition the special functions. I have removed this centre and these functions from this frog by removing the head, and with it, the very centre of the system, or sub-system, itself; the creature is thus entirely deprived of sensibility; the idea of suffering is excluded. It is also deprived of volition; all *spontaneous* movements are impossible.

Yet there is a source and power of movement remaining, for you observe the effect of irritation of the integument covering the toe or foot. This power resides in the spinal marrow, or spinal centre, and certain nerves proceeding to it and from it, termed therefore *eisodic* or in-going, and *exodic* or out-going. I have designated this power *neuro-dynamic*; it was formerly termed the *vis nervosa*; its English appellation would be *nerve-power*.

The nerves which proceed to the centre of this spinal system arise from the skin. I have removed the skin from the left foot, and you will observe that the same irritation which, applied to the right foot, induced contraction of the muscles, is inoperative when applied to this denuded limb; in effect, the origin of the eisodic nerve has been removed with the integument.

But I now irritate the spinal centre itself; you observe the convulsions produced.

Lastly, I irritate these, the lumbar nerves; they are exodic,

A

and proceed to the muscles; again the limbs are violently agitated by movements.

Here, then, are phenomena arising out of irritation of the nerves, *isodic* and *exodic*, and the centre of the spinal system. They attest the neuro-dynamic power of those several nervous tissues.

But there is still a third sub-system of the nervous system; it is termed the ganglionic, and it is connected with all that is *interior* or *within* us. I have here placed aside the viscera of the frog, and with them the ganglionic sub-system belonging to them—the heart, the stomach, the intestines, &c. If you were nearer you would see the heart pulsate, and the stomach and intestines move by what is termed peristaltic action. These phenomena are effected through the medium of the ganglionic portion of the nervous system in which the neuro-dynamic must also reside.

But besides the power residing in the nervous tissues, there is, as above stated, another dynamic. Its seat is the *muscular* tissue, for which reason it may be designated the *myo-dynamic*. You observe the effect of a very slight galvanic influence passed along this muscle; the muscle is immediately vigorously contracted. This is the *vis muscularis* of physiologists, the *muscle-power*.

These vital dynamics, and the physical and chemical stimuli to which I have alluded, bear an inverse ratio to each other. This is the case both primarily and secondarily—the first by creation; the second, by a natural operation and effect; for if stimulus be diminished, the dynamic becomes augmented; and if the stimulus be augmented, the dynamic becomes exhausted, and, in some degree, proportionately reduced, as natural events, causes and effects.

Thus the effect of hibernation, during which the stimuli of air, food, temperature, and nutrition are reduced to their minimum, is to lead to augmented dynamic and excitability, and to what may very appropriately be designated *vernation*, or the activity of spring; whilst the effect of the augmented stimulus in the summer months, that is, of augmented air, food, temperature, and nutrition, is to exhaust or lessen the dynamic of nervous and muscular fibre, however they may augment general activity and power of mass, and prepare the way for the next winter sleep.

By creation and the operation of natural causes, then, the *inverse ratio* between dynamic and stimulus, in animated creation, is—the *Law of Life*.

The attempt to invert this law in either direction, and *equally* in either direction, is to destroy life. Unduly to augment the stimulus when the dynamic is high, or unduly to diminish the stimulus when the dynamic is low, is equally to interrupt the vital actions.

I will again illustrate my subject by a reference to the interesting case of hibernation:—If you take a bat from its winter quarters, from its state of hibernation, in which its respiration is at the minimum, and its dynamic at the maximum, and make it fly about, and so augment the vital stimulus of respiration, it infallibly *dies*! If, on the other hand, you take the same creature in its condition of summer activity, and of high respiration and low dynamic, and deprive it of air by immersion in water, or in an irrespirable gas, it dies too. Invert in either way the inverse ratio of dynamic and stimulus, and the result is fatal.

Low dynamic requires high stimulus; high dynamic, low stimulus. The higher the dynamic, the more capable is the animal of the further abstraction of stimulus, and *vice versa*. If, instead of taking a bat from its summer activity, you take it in its state of hibernation, and now immerse it in water for ten minutes, or even longer, it is altogether uninjured. The bat, taken in its state of activity, and submerged in water, dies in two minutes and a half.

Thus, the hibernating animal dies if its respiration be augmented, whilst it can bear its suspension; the same animal, in its state of vernation, or of activity, can bear its respiration to be augmented, but dies speedily if it be suspended!

I will illustrate this view by another order of facts:—The tadpole of the frog breathes in water, and feeds on water-plants; the same tadpole, become a frog, breathes in atmospheric air, and feeds on insects. It has become a higher breather—a higher feeder. In the former state, the dynamic, in the latter, the stimulus, is comparatively greater. The tadpole would die if taken out of its element, the water; the young frog would drown if compelled to remain in it!

These facts are the results of innumerable experiments. I shall take occasion to revert to them hereafter.

Besides being *inverse*, to which there is no exception, the ratio between dynamic and stimulus may be higher or lower. It is in this manner that we are enabled to explain the *modes*

of life. As life in general is a result of stimulus *into* dynamics, we should, without a provision of this kind, see all animals *equally* active or inactive. Either the reptile would not creep slowly, or the bird tribe would not soar into the atmosphere. But we observe, in fact, that when the stimulus is *disproportionately* low, the animal is of low activity; and that when it is *disproportionately* high, the animal is in the enjoyment of an intense degree of activity.

Throughout animated nature, as I have already stated, in all the varied forms and modes of life, from the eagle to the serpent, the dynamic and the stimuli are in an inverse ratio to each other. Such, as I have observed and repeated, is the Law of Life. In the bird tribes the quantity of air and food imbibed is extreme, the degree of dynamic very low; in the reptile tribes the quantity of stimulus is low, and the degree of dynamic high.

The following formulæ may serve to express this general fact:—

Stimulus	...	8	...	4	...	2	...	1
Dynamic	...	1	...	2	...	4	...	8

The degree of activity, or of inactivity, in all these cases may be supposed to remain the same; but to explain the greater activity of the bird, and the inactivity of the reptile, a modification of the formula is required, which may be thus expressed:—

Stimulus	...	1	...	2+2	...	4+8	...	8+24
Dynamic	...	8	...	4	...	2	...	1

In this manner, whilst the inverse ratio between the stimulus and the dynamic, generally speaking, remains, that of the former may *augment* more rapidly, as we pass into the more active forms of living beings, than that of the latter *diminishes*; and thus the bird and the insect fly, whilst the reptile and caterpillar creep. With higher stimulus, the animal becomes more bird-like; with lower stimulus, it becomes more reptile.

With augmented air and food, other organs, besides those of respiration and digestion, become stimulated to greater action. There is especially a correlation between the rapidity of the action of the heart and of the acts of respiration, arising in a peculiar and reciprocal manner out of the play of stimulus and of the neuro-dynamic, which resides in the spinal and ganglionic sub-systems and the myo-dynamic in the muscles which are respectively under their dominion, and out of the law which binds them together, which deserves to be distinctly described. The blood flowing through the lungs exhales carbonic acid; this is the internal excitator of inspiration acting on the fine branches of the pneumogastric nerves spread over the lining membrane of the lungs; the more rapid the circulation, the greater the quantity of carbonic acid exhaled, and consequently the more rapid the respiration. But this respiration brings the oxygen of the atmosphere into contact with the pneumonic blood in its turn, through the same pulmonary membrane; this oxygen is absorbed by the blood, passes into the circulation, and stimulates the heart to augmented action, and augments the rapidity of the circulation. This last induces, in its turn, a greater exhalation of carbonic acid in the lungs, again augmenting respiration, &c. In proportion to the augmented stimulus the dynamic is diminished.

The *changes* which take place in regard to the ratio of dynamic and stimulus are of two kinds:—1, *Structural*; 2, *Physiological*. The former, in metamorphosis, is usually, if not always, upwards, to a state of higher activity,—and to a state of higher stimulus with diminished dynamic; the latter takes place in both directions, being to one of higher stimulus in vernation, and to one of higher dynamic in hibernation. Activity on the one hand, and repose, and especially sleep, on the other, induces similar, though less-marked, effects.

I think I have said enough to convince you, gentlemen, that there is, in this Law of Life, a most interesting and important fact—a vast generalization. This generalization embraces three great objects—1, The scale of animated being; 2, The metamorphosis, and, perhaps, mere development; 3, Physiological changes. I know of no law so general, so expansive.

I may now observe that it is of deep interest to trace the *criteria* of the ratio between dynamic and stimulus.

1. Galvanism is a test of neuro- and myo-dynamic, just as nerve and muscle in the animal in which these dynamics are high—as the frog—become galvanoscopic, or a test of galvanism.

2. In the animal in which the stimulus is high, the temperature, and its measurer, the thermometer, become a test of its degree, and of course of the inverse condition of the dynamic.

3. The degree of activity, or of inactivity, denotes the relative condition of the two elements of the Law of Life.

4. It has already been noticed, that, in proportion to the dynamic, and in the inverse proportion to the stimulus, the animal possesses the power of bearing the subtraction of stimulus, the privation of air and of food; and is, in more senses than one, endowed with *tenacity of life*.

The length of time during which an animal can bear the privation of air, or breathe a given limited quantity of air, is proportionate to the dynamic.

5. The quantity of respiration affords a measure of the stimulus. This is ascertained in various ways—1, By the structure and extent of the *lungs*; 2, By the number of the respirations; 3, By the quantity of oxygen imbibed, and of carbonic acid exhaled.

In proportion to the *surface* of the lungs on which the methamorous or blood-changing channels are spread, in proportion therefore to the complexity of the structure of the lungs is the quantity of respiration. The fish has a mere gill; the batrachian has a vesicular lung, with or without subdivisions or intersections, as we observe in the triton, or in the frog or toad respectively; the lung of the serpent, the tortoise, the tribes of the mammalia, and of the birds, becomes more and more complex and extended; in the insect and in the bird, the respiration is extended over the system, not being limited to one organ; in the insect, indeed, each articulate segment is furnished with an analogue of the medulla oblongata, as a central nervous organ of the respiration. The dynamic exists in an inverse proportion.

6. The quantity of food assimilated or respired is a stimulus in itself, and in its proportion to respiration becomes a measure and criterion of the degree of dynamic inversely. In speaking of the quantity of stimulus, as represented by the food, we must also bear in mind the quality as well as the quantity of that food, and its convertibility into calorific and nutrient principles. *Insect* food is, perhaps, of all kinds of food, the most stimulant, whilst vegetable food is the least so. It must also be a question how much of the food is really made available, and how much is excreted, unrespired, unassimilated.

7. We have in the circulation a criterion of the kind and character of life; slow and with methamorous vessels in the animal of low stimulus and high dynamic, it becomes quicker with more crowded vessels as the stimulus is greater. The structure of the lung and the degree of rapidity of the movement of the blood-globules must be carefully noted; as the former becomes more complicated and the latter augmented, the quantity of stimulus is higher, and, I need scarcely say, the degree of dynamic lower.

There is, indeed, no subject so replete with interest as the *circulatory apparatus*—*pneumonic and systemic*—in themselves, in the different orders of animated beings, and in reference to the Law of Life. The entire apparatus consists of—1, The minute arteries; 2, The minute veins; and 3, The intermediate blood channels, or, as I have proposed to denominate them—from the important fact that all the changes which take place in the blood take place in them—the methamorous, or blood-changing, channels. These vessels are specifically distinct, a distinction on which I have insisted on another occasion.

I must now, gentlemen, in the last place, bring before you certain results of that Law of Life which I have thus very inadequately sketched. In doing this, I shall be compelled to repeat some of the preceding remarks; but I prefer this to the alternative of leaving my sketch incomplete.

The first remark I have to make in regard to the results of the Law of Life, relates to the temperature of animals of high dynamic and of low respiration, and consequently of low temperature. Such animals are said to be of *cold blood*. This expression is inaccurate; no animal is positively of cold blood. The species of lowest temperature is still of a temperature higher than that which would subsist absolutely without respiration, and its blood is only *low* in temperature, without being as cold as the surrounding medium.

Even amongst fishes, some are high, others low, feeders and breathers, with a corresponding temperature. The trout can only live at the surface of a limpid stream, breathing highly oxygenated water, and feeding on the insects immediately on that surface; the carp, on the contrary, lives and breathes lowly, at the lowest parts of stagnant pools. The trout is comparatively a fish of high stimulus—food and respiration—and temperature, and of low dynamic; the carp of high dynamic and low stimulus. The trout dies almost immediately if taken out of its crystal element; the carp will live for days in wet moss—that is, out of its own element, abundantly supplied with moisture, or in a limited portion of water ill supplied with mixed atmospheric air.

As we rise in the scale of animated beings, from the fish to

the reptile, from this to the mammalia; and from these to birds, the respiration, and, with this, the temperature, also rises, the dynamic proportionately falling; the temperature of the fish and reptile is slightly above that of the medium in which they dwell respectively; that of the mammalia is about 98°; that of the bird tribes, about 102° Fahr.

The temperature accurately coincides with the quality and quantity of food, the quantity of respiration, and is, in effect, the development of an internal stimulus from stimulant ingesta.

With temperature, there is also, probably, the evolution of the galvanic agency.

The galvanic apparatus, the thermometer, the quantity of food, the quantity of oxygen, the power to bear the abstraction of these stimuli, or, in certain circumstances, their addition: all these are criteria of the place a given animal, in a given condition, ought to occupy in the zoological or physiological scale.

Growth, development, metamorphosis, nutrition, in ovo and extra ovum, are other results of the play of vital powers, dynamic and stimulus. With each of such changes in form, a change in kind of life, or a metabiosis, occurs.

Of these, hints have been dispersed in the preceding remarks. If I have succeeded in giving you, gentlemen, an adequate idea of them, and of the other topics involved in the development of the Law of Life, I shall feel much gratified. Pray accept my best thanks for your kind attention throughout this imperfect lecture.

Each part of my subject would afford scope for distinct discussion, and one object of my visit to the United States is to secure to myself both the leisure and the opportunity for further physiological inquiry in regard to it. In this object I know and feel that I shall be assisted by the liberal and generous people amongst whom it is my lot, for a time, to dwell, and by the noble and free institutions, the objects of which it may, as on the present occasion, be my proud privilege humbly to promote.

Of the Smithsonian Institute I can only most cordially say, may it prosper, and may it long be the means of the diffusion of knowledge, and of consequent good to mankind!

## LETTSONIAN LECTURES

ON *Medicine*.

DELIVERED BEFORE THE

MEDICAL SOCIETY OF LONDON,

DURING THE SESSION OF 1856-57.

BY THEOPHILUS THOMPSON, M.D., F.R.S.,

PHYSICIAN TO THE HOSPITAL FOR CONSUMPTION.

### LECTURE I.

#### ON PULMONARY CONSUMPTION AS A LOCAL DISEASE.

*Minute anatomy of the lungs. Seat and nature of tubercle. Three varieties of hæmoptysis, and their causes. Relation of tubercle to epithelium. Changes in the expectoration detected by the microscope assisting the diagnosis, and indicating the progress of pulmonary disease. The spirometer.*

MR. PRESIDENT,—The science of medicine is broad—the mind of man is narrow. Rarely have I felt this truth more forcibly than while preparing to fulfil the honourable task with which this distinguished Society has entrusted me. In attempting to treat a special subject, I have continually found how the special becomes general in the laws which it illustrates; for every object spreads as it is scrutinized, and, as respects the structure of living beings, what is most minute in form seems greatest in the truths which it embodies. Many eminent men, on the continent and in this country, have, during the present century, devoted distinguished talents to the description and elucidation of the pathology of the lungs. It is not, however, my present intention to give an abstract of their views, but rather to invite your attention to the aid afforded in the investigation by the use of the microscope, and to show you that this instrument, by moving forward our station for

observation, seems to bring us nearer to the locality of those changes with which the primary processes of disease are connected.

The first anatomical characteristic of the lungs, connected with our inquiry, is their division into lobes, of the lobes into secondary lobes, and of these secondary lobes into lobules. To understand the structure of one of these lobules, is to understand the structure of the lungs. A lobule is wedge-shaped, it has an artery, nerve, and lymphatic vessel, entering at the small extremity of the wedge, and is composed of inter-cellular passages and air-vesicles. The inter-cellular passages appear cribriform from the openings of the cells. These cells communicate with one another, but not with the cells of contiguous lobules.

The changes in the anatomical conformation of the bronchial tubes, as they ramify in the respiratory organ, demand notice. A bronchus has five important laminae—first, a mucous membrane; secondly, a longitudinal layer of elastic tissue; thirdly, a layer of cartilaginous flakes; fourthly, circular muscular fibres; fifthly, areolar tissue. As a bronchial tube enters a lobule, it drops the cartilaginous flakes; in the inter-cellular passages, the muscular fibres disappear, but the elastic tissue is continued, to form the circumference of the cells.

The mucous membrane is divisible into three portions—namely, the epithelium, the basement membrane, and the areolar coat. The epithelium is again divisible into three layers—namely, the ciliated, the nucleated, and the non-nucleated, the first of which is not to be detected in the pulmonary vesicles.

The importance of these particulars, minute as they may appear, will become obvious as we proceed.

The hazy appearance produced by the tubercular deposit gradually filling the pulmonary vesicles, is well portrayed by Dr. William Addison.\* A successful injection of tubercular lungs assists us to determine the situation of the deposit. Mr. Rainey was in this way enabled to give an instructive delineation of the appearances presented by such deposit, and to show that the tubercular matter, being poured into the interior of the air-cells, the septa of contiguous cells are compressed, the vessels being thus gradually obliterated, and the supply of blood cut off. Imperfect examination of the vascular connexion of tubercle with the surrounding air-cells, led some pathologists into the mistake of supposing the deposit to be vascular. The vessels which appear are, however, only portions of plexuses which have been partially absorbed, for they are evidently arcs of circles, of the same radius as the plexuses between the air-cells. The natural appearances of the vessels close to the tubercular deposit, and in the cells, which are partially infiltrated, as compared with the tortuous state of vessels passing to air-cells filled with fibrine, in consequence of inflammation, while it supplies us with a reason for maintaining that the accumulation of the deposit by which the vessels are obliterated is effected gradually, at the same time furnishes evidence for the existence of a difference in essential character between pneumonia and phthisis.

A further contrast might be suggested between the appearance of the vessels in the neighbourhood of tubercle and that of the small vessels of an emphysematous portion of lung. The vessels which remain in an emphysematous portion of lung are hypertrophied; so that, although, making allowance for obliterated vessels, the quantity of blood circulating in an emphysematous lobule may not be reduced, much of the blood is not accessible to the aerating influence.

There has been, from time to time, considerable difference of opinion regarding the cause of hæmoptysis. There are, probably, three separate causes capable of producing this symptom. The dots and streaks of blood observed in the expectoration at an early period, when phthisis is only apprehended, may sometimes depend on deterioration of some of the extreme vessels of the lungs. The profuse and even fatal hæmorrhage now and then, although rarely, occurring, may be induced by yielding of considerable vessels in cavities, the infrequency of such an event being attributable to the fact, that arteries are inapt to ulcerate, and are usually fortified by extraneous deposit. The ordinary and average hæmoptysis occurring as a symptom of consumption may probably be referred to obliteration of vessels in the way above described—namely, by the pressure of tubercular deposit occasioning the blood to exude or overflow into the neighbouring bronchi. It is easy to understand that such deposit, by impairing the elasticity of the pulmonary vesicles, and thus rendering expiration less natural and easy, may occasion the prolonged expiratory murmur which, in the absence

of bronchial or other obstruction, is so significant a sign of the existence of tubercular affection.

If a portion of a lobule, such as is represented in Rainey's plate, be submitted to a high magnifying power, you will find the material with which the vesicles are permeated to consist in a great degree of cells differing from any which can be detected in the healthy lung. In the accompanying diagram from Schroeder van der Kolk, (the object being mag-

FIG. 1.

nified 420 diameters,) you observe the margin of some of the air vesicles exhibiting ordinary epithelial cells (*d*); in other vesicles you observe cells darker in tint, swollen, and spherical; and in the parts most involved in disease, these cells are still further enlarged and misshaped (*b*), also Fig. 2 (*d*), even shrivelled or burst, and setting free nuclei, as seen in Fig. 2 (*b*);

FIG. 2.

elastic fibres, pus cells, pigment cells, calcareous matter, and cholesterine are also frequently associated. The nuclei of tubercle cells are obvious, without the addition of acetic acid; they abound in fat granules, and possess a granular envelop. It is evident that this deposit is substituted for the under layers of epithelium, being an abortive, but hasty, production from the material which should form healthy granular corpuscles. The corpuscles of Lebert are probably enlarged nuclei of the morbid cells.

For the elucidation of this subject, a few remarks may be desirable, respecting cell formation. The proper material of any part of the body is not formed directly of exudation from the blood, but it requires the intervention of minute bodies, varying in size, but averaging about the 200th part of an inch in diameter, endowed by virtue of their vitality with a power of separating from the fluids the materials for their own proper growth, and also supplying the elements necessary for maintaining the structure and function of the organ in which they are placed; in one part, for example, supplying bile, in another mucus, in another fat. Whether granules of the same original character, carried over the frame, under the nervous or other influences of each part, adopt an office suited to the necessities of such part, or whether the blood is charged with myriads of granules of every variety, which, finding respectively their proper nidus, assume their pre-arranged office, science cannot yet inform us, and the subject is one which we can only regard with the wonder of broken knowledge. In reference to this subject, I cannot deny myself the pleasure of quoting a passage from Pascal, who, two centuries since, looking forward with the glance of genius, seeming to see what we are only beginning to discover, expressed the sentiments I now repeat:—"Show me, in a minute animal, a limb, in that limb a joint, in that joint a vessel, in that vessel blood, in that blood humours; in those humours I will show you wonder within wonder, which shall make you feel that man, whom before you regarded as a point almost invisible in the universe, is himself an universe compared with the minuteness to which you cannot reach."

\* On Healthy and Diseased Structure. London, 1849. Plate IV.

† Transactions of the Royal Medical and Chirurgical Society. 1845. Plate V., Fig. 4.

In the formation of epithelial cells we may trace three stages—first, that in which a granular nucleus is apparent; secondly, that in which a vesicle takes the place of the granular nucleus; and, thirdly, the period of decay. It would seem to be at the time when the albuminous element gains on that of the fatty or granular, that the first discoverable indications of phthisical deterioration occur; but whether the cell-granule is from its first formation faulty, or whether any influence arises subsequently to check its healthy progress, we cannot at present determine.

Let me proceed to a department of the inquiry regarding which more definite information can be obtained. You will presently perceive the grounds of transition to the subject of expectoration.

As respects the progress of consumption, the principal appearances of the expectoration may be described under three divisions:—

1. Frothy, characterizing irritation, which, however, may be produced by various causes, besides the presence of tubercular deposit in the cells.
2. Gelatinous. This variety is transparent, resembling a drop of isinglass; not stringy. It is indicative of a chronic form of irritation, unlike that from bronchitis or pneumonia, and is usually tubercular.
3. The purulent, of which there are three marked varieties:—
  - (a) Simple purulent.
  - (b) Flocculent; characteristic of secretion from a vomica, modified by absorption of the thinner constituents; very rarely occurring from any other cause.
  - (c) Non-coherent. This is thick, scanty, rather firmer than common pus; sometimes brought up without cough; often accompanied with slight hæmoptysis. It indicates a chronic form of tubercular affection, in which the diseased action is checked.

Can we, by the aid of the microscope, obtain more definite and positive information regarding these different kinds of expectoration? Microscopical observers have hitherto given us little encouragement in this attempt. Rainey concludes his paper on the minute structure of the lungs with the remark, that the expectoration in the phthisical "most probably is not to be distinguished from that in ordinary bronchitis." He adds, "It will be only during the breaking up of a tubercle that matter truly tuberculous will be expectorated; and this, I believe, can be recognised with certainty by no other character than its containing fragments of the membrane of the air-cells." Dr. William Addison, in an interesting work,\* published only five years since, observed—"Great attention used formerly to be paid to the expectoration, with a view to determine whether it was pus and came from a cavity in the lung, or whether it was only mucus from the air-tubes. More recently, it has been supposed that a microscopical examination would determine the point. But it is now known that the inquiry is useless, mucus and pus being only varieties of the excretion natural to all mucous or granulation fabrics." Only last year, I published a discouraging opinion† as respects the prospect of deriving any practical advantage from this application of the microscope. Since that time, however, I have been induced to change that opinion, and I now hope to show that, with careful attention, the microscope will afford definite and conclusive information regarding the disease in its progress, and open views of peculiar interest respecting its origin.

Frothy expectoration contains stringy mucus and the outer layer of epithelium, cilia being often observable. A gentleman whom I visited a few weeks since with Dr. Crosse, was affected with obstinate cough. There was some hereditary tendency to consumption; his aspect was rather unpromising, and there was dull percussion in the right subscapular region. It was doubtful whether this dull percussion depended on tubercular consolidation; but the absence of any tubercular element in the purely bronchial frothy sputum, when microscopically examined, encouraged us to give a favourable prognosis, which has happily been confirmed by the successful issue of the case.

The second variety—namely, the gelatinous, is transparent, not stringy, and resists pressure between the glasses of the microscope. It contains granules, molecules, not aggregated, cells partly devoid of granules, and oil globules. (See Fig. 3.)

FIG. 3.

A more advanced stage is seen in Fig. 4.

FIG. 4.

Of the third kind—namely, the purulent—the flocculent is so characteristic of phthisis, that from its external appearances alone we may almost venture on a diagnosis. Under the microscope, the correctness of this opinion is usually established by the appearance, mixed with pus corpuscles, of the unmistakable shrivelled cells, granules, molecules, and oil globules, (see Fig. 5,) not unfrequently also of the curled elastic tissue surrounding the pulmonary vesicles.

FIG. 5.

FIG. 6.\*

Let me give you, however, a proof that exceptions to the general rule regarding flocculent expectoration may occur, particularly as it affords an instance of the advantage of microscopical investigation. I was recently attending with Mr. Clayton, a patient above sixty years of age, with emaciation, rapid pulse, and gurgling voice and cough near the apex of the right lung. The expectoration had the woolly aspect so often indicative of phthisis. The microscope, however, failing to exhibit shrivelled cells, I ventured on the diagnosis of dilated bronchial tube, and the course of the malady is confirming the accuracy of the suggestion.

The simple purulent expectoration, if derived from a vomica, usually contains curled elastic tissue of the lungs, as well as other characteristic manifestations of tubercular formation.

Dr. Hart Vinen, a fellow of this Society, lately requested me to see with him a young lady who had suddenly coughed up a pint and a half of pus. She was too weak to be moved, and there were other difficulties in the way of examination; but on placing the hand beneath her chest, vocal vibration

\* On Healthy and Diseased Structure, p. 169.

† Clinical Lectures on Pulmonary Consumption, p. 49.

\* Fig. 6 represents the same after the application of acetic acid.

could be felt on the right side, near the scapula, more marked than natural. This, and other circumstances, were opposed to the idea of pleuritic effusion, and the question of vomica had to be considered. The pus, which was more coherent than in ordinary abscess, contained no elastic tissue, and very few misshaped shells or loose granules. The conclusion formed was, that there was no pulmonary abscess, probably no vomica, but possibly bronchial affection, connected with suppuration in a bronchial gland. The expectoration lessened, the patient's strength improved, and when she was once more able to sit up, we detected dull percussion over the region of the bronchial glands, with pleuritic friction-sound in the neighbourhood.

The non-coherent variety of pus contains shrivelled cells and angular earthy deposit, sometimes also cholesterine.

On comparing the diagrams of the appearance of the sputum with those on a somewhat larger scale, given by Schroeder van der Kolk, (see page 4,) of the altered cells in tubercular portions of lung, I think you will be impressed with the correspondence, and agree with me, that the history of the disease in progress is told by the microscopical appearances. In the expectoration, as depicted in the diagrams before you, it is not merely pus and mucus that you see, but cells, which should have formed healthy epithelium, hastily developed, overgrown, losing their vitality, shrivelling or bursting, and parting with their granules. The rapidity of the disease bearing a proportion to the number of the fat globules and of bursting cells, you derive aid of considerable importance in prognosis as well as diagnosis.

Is there not, then, a new field opening for the profitable application of microscopical inquiry? As in the examination of the urine—a department of science so well cultivated by our esteemed member, Dr. George Johnson, and others—the fibrinous tube casts, when charged with blood or pus corpuscles, indicate activity of disease; or, casts assuming the waxy character, usually give definite grounds for the conclusion that chronic decay is in progress; so, by examination of the sputum, we may come to determine not only the nature but the activity of pulmonary disease.

Dr. Andrew Clark, to whom I am indebted for the graphic delineations from which my diagrams are enlarged, and for suggesting, as I believe, the true course for investigation in

this department of inquiry, will, I hope, pursue the subject, and hereafter bring before the profession more liquid information than I am able to convey.

Passing from indications of the nature of the disease, let us consider a method which has been proposed, and extensively employed, with a view to measure the amount. By means of an instrument constructed on the principle of the gasometer, the quantity of air thrown out of the lungs by forced expiration, (after full inspiration,) as tested by this instrument, is termed by Dr. Hutchinson the vital capacity. The occlusion of cells by the intrusion of tubercular deposit may be expected, in a proportion corresponding to its amount, to lessen the vital capacity; and this expectation, with certain qualifications, is realized. One of the most important of these qualifications respects the height of the patient. This influence of height is not dependent on the altered size of the chest, for diversities of height are far more dependent on the length of the limbs than of the spinal column. Extreme instances are often useful for the illustration of a rule, and, under this idea, Dr. Hutchinson gives an interesting example, in which a man only four feet four and a half inches high really sat a quarter of an inch higher than a man five feet nine inches and a half in height, having nevertheless a vital capacity eighty-four inches less than that of the tall man. Such a result is nearly in correspondence with extended observation, the vital capacity being found in healthy individuals to be on an average greater by eight inches for every inch in height. How is this unexpected result to be explained? A clue to the explanation may, I think, be supplied by the consideration that, the office of the lungs being to modify the blood of the whole body, there must be a proportion between the pulmonary and the systemic circulation, and a harmony between the extent of pulmonary cells and of the vessels which they serve.

It occurred to me as an interesting inquiry, (assuming such a principle to be correct,) whether, in men who had been for a considerable period deprived of portions of limb, a proportionally diminished vital capacity would be established. Dr. MacLachlan, of the Chelsea Hospital, has lately done me the favour to examine some pensioners, with a view to this inquiry, and the accompanying table exhibits the results:—

*Nominal Return of Men in the Royal Hospital, Chelsea, who have lost a Limb, showing the age, height, &c., and the "vital capacity" of the Lungs.*

Name.	Age.	Height.	Weight.	Extent of leg or arm lost.	When lost.	Vital capacity.	Healthy vital capacity at same height.	General Condition.
		ft. in.	st. lb.			1st trial. 2nd trial.		
Farmer .....	68	5 6	12 8	Amputation below knee.	1835	131 ... 130	214	Healthy, competent, and still active.
Hartnell ...	42	5 8½	10 4	Middle of forearm.	1839	210 ... 212	236	Healthy and active.
M'Cardell...	64	5 6½	...	Two inches above wrist.	1813	81 ... 60	218	Asthmatic, and ribs ossified.
Molloy .....	68	5 3	11 1	Amputation below knee.	1807	132 ... 130	190	Bulky, with a full chest, active.
Nelson .....	61	5 3½	11 2	Amputation above wrist.	1812	170 ... 160	194	General health seems good.
Baker .....	65	5 9	9 11	Amputation below knee.	1813	160 ... 165	238	Spare, active.
Murrell .....	69	5 7½	8 10	Ditto.	1813	132 ... 134	226	Spare, active, and healthy.
Thomas .....	72	5 3½	...	Ditto.	1809	60 ... 50	194	Feeble and asthmatic.
Tetty .....	78	5 10	9 6	Ditto.	1807	130 ... 110	246	Suffering from cold.
Williamson.	48	5 7	8 11	Thigh midway.	1853	160 ... 160	222	Healthy and active.
Stringer ...	66	5 5½	8 1	Amputation ditto.	1812	150 ... 150	210	Spare, active, and healthy.

7th March, 1854.

The advanced age or unhealthy condition of some of these individuals complicates the calculation, but several of them, especially the two middle-aged men—Hartnell and Williamson, furnish examples to a certain extent corroborative of the surmise which has been offered.

Such observations, however, require to be much extended before any positive deduction can fairly be drawn.

It is stated by Dr. Hutchinson, that the vital capacity of women is twenty-five per cent. less than that of men. Can any reason be suggested for this contrast? I am not without a suspicion that the relative proportion of blood-corpuscles is concerned in the difference. Le Canu, indeed, gives a corresponding proportion, nearly twenty-five per cent., as the average excess of blood-corpuscles in men over those in women. These blood-corpuscles being the conveyers of oxygen, the work of the pulmonary cells must be proportioned to their amount. Are we not, then, conducted to an explanation, which, if it prove correct, converts a seeming anomaly into a beautiful example

of adaptation and harmony? We are reminded that every pulmonary cell, in a certain sense, has a corresponding portion of the body to supply with arterialized blood, and that every part of the animal frame has a special adaptation to every other. Thus am I brought back to the train of thought with which this lecture was commenced—namely, that the most minute is great in the laws which it illustrates; that, in the living body nothing is isolated; that it is our office and privilege to gather the scattered portions of observation, and show the place which every fragment has to occupy in the great body of truth.

HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, JULY 1.—The total number of deaths registered in the metropolitan districts was 1290. In the ten corresponding weeks of the years 1844-53, the average number was 990, and if this is raised in proportion to increase of population it becomes 1089. There is, therefore, an excess in last week's return of 201 above the estimated amount.

# A SKETCH OF THE PRESENT CONDITION AND TREATMENT OF DISEASES OF THE URINARY AND GENE- RATIVE ORGANS IN PARIS, COMPARED WITH THOSE IN LONDON.

By WILLIAM ACTON, Esq., M.R.C.S.,  
FORMERLY SURGEON TO THE VENEREAL HOSPITALS OF PARIS.  
(Continued from page 869, vol. I. 1864.)

## THE INFECTING CHANCRE.

RICORD, however, calls the Hunterian chancre, which hitherto has been generally known in France as the *chancre induré*, the infecting chancre, (*chancre infectant*), in consequence of its being the only sore which will probably produce constitutional syphilis, and I agree with him that this gives the reader the best idea of its nature; thus a man may have a simple undurated chancre, and another may suffer from the firm indurated sore, which is certain to produce secondary symptoms. In one word, a vast amount of information is gained by the mere adjective, infecting. This is the form of chancre in which mercury must be given, and continued for a long period, as the only chance of obviating secondary symptoms. No alteration has taken place in the treatment of this form of chancre since I was last in Paris, and mercury is still found as necessary as it was fifteen years ago; further experience has only corroborated the opinion, that upon mercury alone does the cure depend. These opinions are, I believe, now generally admitted, except in Edinburgh, where, if I may judge from a review of the last edition of my work on the "Urinary Organs," which appeared in the *Edinburgh Monthly Journal*, in 1851, syphilis, under whatever form it exists, is treated without mercury; and, in consequence of having given utterance to opinions similar to those stated above, I find myself classed among those who labour under "the destructive delusion of the old mercurial school," and accused of "having been educated in a mercurial atmosphere." In the same review, the Scottish profession is told "that the simple treatment of venereal sores taught and practised in this part of the world, (Scotland,) if adopted elsewhere, would reduce many practitioners from comfort to starvation."

It is not my purpose, at the present moment, to bandy trifling language with my critics; suffice it to say, that in accordance with the principles I learnt in Paris, I have always advocated treating simple undurated sores without mercury, and I hope my writings have discountenanced the too general employment of that mineral; but private practice during the last twelve years has more fully confirmed my opinions, that the indurated chancre cannot be treated without mercury; and Ricord corroborates, with his sanction, the universal treatment of the infecting chancre with a long-continued course of mercury, and he thinks that it is of little use employing this valuable remedy unless it is continued for some months, not only for the purpose of removing the induration which attends this form of chancre, but for guaranteeing the system against the occurrence of secondary symptoms, which inevitably will occur unless the surgeon perseveres in its use long after the healing of the sore.

Within the last few days, a case strongly corroborating the necessity of giving mercury in proper doses has come under my care:—A fair-haired man came to consult me, with spots of syphilitic psoriasis on his body, and most severe pain on one side of his head, together with an indurated sore on the penis, with its usual attendant, chronic enlargement of the glands of the groin. The patient told me that he had contracted the disease three months ago, when he was treated by an homoeopath with the usual small doses of mercury. About a month ago the mercury had been left off, and potash had been given, but without any benefit; and, his confidence failing, he had come to consult me. Here, then, is one out of many cases I could cite of the little good of small doses of mercury.

I may mention that the doctrine of treating indurated sores with mercury appears to be generally received as the recognized treatment in Dublin, where formerly the opinions of Carmichael were generally admitted—viz., that most of the forms of syphilis could be cured on the non-mercurial plan.

In France, at the present day, salivation is considered rather an unfavourable circumstance than otherwise; and as soon as this symptom arises, mercury is left off, to be resumed the moment the gums cease to be swollen. But it is a curious fact,

that it is often a very difficult matter to induce salivation in the ordinary cases of indurated chancres; and notwithstanding the considerable doses of the mineral, and the long continuance of the treatment, the action of mercury is shown rather by the disappearance of the symptoms of syphilis than by any affection of the gums, persons labouring under induration apparently showing little tendency to salivate.

The preparation still most commonly employed in Paris is the proto-iodide of mercury, to the exclusion of almost all the others. In London I still, however, find it as objectionable as when I wrote the second edition of my book, when I stated that this preparation usually produces colic in the damp, cold climate of England, consequences which have caused me to exclude it from my own practice, and obliged me to prefer frictions, blue-pill, or the grey powder.

## THE PHAGEDAENIC CHANCRE.

I saw several of these sores in the course of treatment by a new plan which Ricord has lately introduced into practice,—namely, by destroying the whole of the unhealthy surface with the red-hot iron, having previously placed the patient under the influence of chloroform. Cases which formerly resisted every form of treatment, and lasted many months and even years, are now readily cured by the actual cautery in a short time, the surgeon taking care to cover the surface with strips of ammoniacum and mercurial plaster after the sloughs have separated; the internal treatment still consisting in giving the tartrate of iron, which succeeds alone in the less obstinate cases. In private practice, cases requiring the use of the red-hot iron are very rare, but in hospital practice they are more frequently met with, and we occasionally witness cases, several inches in circumference, extending at one corner, while they imperfectly heal in the other; these are called serpiginous sores. The variety which we meet with most frequently in London is the phagedaenic sore, attended with induration. This is a form not unfrequently seen in consultation, and in which the actual cautery is of no avail, but which must be treated by mercury, at the same time the system is supported by bark, wine, or steel. This variety is attended with the worst forms of secondary symptoms taking on the character of secondary ulcers, rupia, and the bones are early attacked, and I have met with it much more frequently in London than in Paris, influenced probably by food and climate, which are found to be such active agents in causing the diversity we notice in the forms of syphilis.

## CONSTITUTIONAL SYPHILIS.

Little doubt can, I think, exist, that all the milder forms of secondary symptoms are as common in Paris as in London. In going through the French hospitals, we witnessed all the varieties of that Protean disease, but we saw but few of those severe and afflicting cases that we daily witness in London, and the aggravation of the forms in London we attribute in a great measure to the climate, food, and intemperance which is commonly met with in England. A case came under my notice, within the last few months, which strongly impressed me with this opinion. A nobleman was travelling in Spain, and at Seville, after coimection with a Spanish lady, he observed what he considered to be an excoriation. As this gave him little inconvenience, he merely applied some lint and water, and continued his journey. The little sore remained for some time in *statu quo*, as long as he was subject to the climate of the continent; but in a few weeks after his return to this country he became alarmed at the increase in the sore, and consulted me, when I found a hard, indurated mass, which was very characteristic of the true infecting chancre, accompanied with well-marked psoriasis palmariis. This gentleman's health was still excellent when he consulted me, and I felt fully convinced that had he remained in the south these constitutional effects would not have occurred; and I mention the case as illustrating the inexpediency of contrasting syphilis and its effects, with or without treatment, in different countries, as what is true in the south may not be verified in the north; and I can hardly believe that constitutional syphilis is more amenable to the non-mercurial treatment in Scotland than in England. Those interested in investigating the subject further, I must refer to my last edition for further curious details.

Another peculiarity that deserves the attention of the English surgeon, is the frequent occurrence of secondary ulcers in London as compared to Paris. In the latter capital, these late constitutional affections are very uncommon; with us, in England, they are frequently met with; and the previous treatment, with or without mercury, appears to have nothing to do with their occurrence. I should further say that in London there is a great tendency, in many of the forms of constitutional syphilis, if left to themselves, to take on an ulcerative form.

Ricord still holds to the opinion that secondary symptoms can occur but once in a man's lifetime, (although relapses may frequently recur;) and that, when cured of constitutional syphilis, these symptoms will not break out again, although a man may have primary sores several times subsequently. Several cases have come under my notice in private practice, which at first sight have somewhat shaken my belief in this doctrine; but I cannot say that I have ever seen a case which contradicts the law laid down by my friend Ricord. To illustrate my meaning, I may mention one or two instances.

In 1851, I attended Mr. J—— with indurated chancre. I gave him mercury for some time, and he remained quite well, when, in December, 1852, he came to me with a slight sore, the result of fresh infection. I cauterized the ulcer twice, noticing at the time a very little induration. This gentleman found no necessity of returning to see me until January, 1853, when he presented himself with well-marked, but slight, secondary symptoms on the body and limbs, which yielded readily to mercury.

In the course of the present summer, I saw a gentleman for the first time, with a slight sore, attended with the slightest trace of induration. He told me that eight years ago he had been under the treatment of a leading Dublin surgeon, with a primary sore, attended with sore-throat, for which mercury was given. The sore about which my patient consulted me took on a phagedenic action, and a similar one appeared on his chin, as well as on his head, which presented all the characters of advanced secondary ulcers.

Now, in both these instances, I think it very possible that the secondary symptoms depended upon the first infection, for we well know that primary syphilis may for a time be cured by mercury, which, in certain constitutions, has the power of controlling it, and not eradicating the syphilitic diathesis. If we suppose, then, that such had been the case in the two instances before us, we need not go further to explain the so-called occurrence of secondary symptoms a second time; and, as will be seen by reference to my late work, the distinction will not be without importance on the treatment a surgeon ought to pursue. That secondary symptoms will recur long after the apparent cure of the primary ones, was strongly brought under my notice by Ricord, during my late visit to his hospital, in the case of hereditary syphilis in a boy who was suffering from disease of the bones of the nose, with affection of both tibiae, one being half an inch longer than the other. Ricord had no doubt, from the history of this case, that the affection depended upon hereditary syphilis, re-appearing after this long interval from a primary affection in the father. Did space admit of it, I could give further instances of the same fact.

Before quitting this subject, I would remark, that syphilitic affections of the nails is an affection much more frequently met with in London than in Paris. I have already, elsewhere, drawn the attention of the profession to the fact that syphilitic iritis is not common in the French hospitals, although here we not unfrequently see instances of the complaint.

It may be expected that I should say a few words on the subject of inoculation of secondary symptoms. During the last few years many attempts have been made to inoculate constitutional syphilis, and persons have asserted that they have succeeded, cases being brought forward to substantiate the opinion; but, after close investigation of the instances cited, and the absence of any person capable on the spot of pointing out the sources of error which may have occurred, I am induced to believe that the truth of the position I advanced in the first and second editions of my work still remains uncontroverted—namely, that, heretofore, we have completely failed in being able to inoculate the secretion of secondary ulcers, or any form of constitutional symptoms, and I shall still maintain the truth of what I have advanced until cases shall have been produced before competent persons.

(To be continued.)

**EPIDEMIOLOGICAL SOCIETY.**—At a meeting of the above Society, held on Monday, July 3rd, 1854, at the house of the Royal Medical and Chirurgical Society, Dr. James Bird in the chair, a paper was read by Mr. Tucker "On the Use of Vegetable and Mineral Acids in the Treatment, Prophylactic and Remedial, of Epidemic Disorders of the Bowels." Dr. James Bird, Mr. Hunt, Mr. Propert, Dr. Snow, Mr. Cox, Dr. Camps, and others, joined in the discussion. The author of the paper was warmly supported in the views he had taken by most of the speakers, and a cordial vote of thanks was awarded to him for his able and practical production.

## A Mirror OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### UNIVERSITY COLLEGE HOSPITAL.

STRANGULATED FEMORAL HERNIA; OPERATION; TEMPORARY  
INGUINAL ANUS; RECOVERY.

(Under the care of Mr. ERICHSEN.)

In the course of our nosocomial experience we have known knuckles of intestine, after the operation for strangulated hernia, to be returned into the abdomen in an *almost* gangrenous state, and the patient to recover; again, we have seen sutures applied to wounded intestines, and the injured individual regain all the integrity of intestinal function;\* and we have had the satisfaction of seeing patients recover, who had suffered from inguinal anus for some time in consequence of sloughing of intestine after prolonged strangulation. In cases of the latter kind the surgeon is not called upon for active interference, and the favourable results which have often been observed are well known to be principally due to the beneficent efforts of nature. The steps of the process are described by Scarpa in the following manner:—"The hernial sac does not always partake of gangrene with the viscera contained in a hernia; and even when it does slough, since the separation of the dead parts happens on the outside of the abdominal ring, there almost always remains in this situation a portion of the neck of the hernial sac perfectly sound. It may be said, therefore, that in all cases, immediately after the loosening of the mortified intestine, whether it happens within or on the outside of the ring, the two orifices of the gut are enveloped in the neck of the hernial sac, which, soon becoming adherent to them by the effect of inflammation, serves for a certain time to direct the fæces towards the external wound, and to prevent their effusion into the abdomen. In proportion as the outer wound diminishes, the external portion of the neck of the hernial sac also contracts; but that part which embraces the orifice of the intestine gradually becomes larger, and at last forms a kind of membranous, funnel-shaped, intermediate cavity, which is the means of communication between the two parts of the bowel."—(Extracted from "Cooper's Dictionary," p. 224.)

This is certainly a beautiful process, and would not have been observed but by a patient and persevering searcher after the secret ways of nature; it should, however, be added, that pressure of the skin from without, inwards, during cicatrization of the wound, has much to do with the favourable result. As to the frequency of cases terminating favourably, Mr. S. Cooper says:—"Numerous cases on record furnish abundance of proof that the fæces, after being voided for several months from the wound made to free a strangulated hernia, frequently resume their natural course. Facts of this kind, which in general may be considered as common when the intestine is without loss of substance, are not very rare, even when more or less of the bowel has been destroyed by gangrene; and many illustrations of this remark may be found in the writings of De la Peyronnie, Louis, Petit, Pott, Le Dran, &c. Several such cases have fallen under my own observation. The greater number of these instances of success were the result of the most simple unofficious treatment, or rather of the undisturbed and very little assisted efforts of nature." The present case comes under this class, but is distinguished for the very short time in which the parts regained their normal relations. The details were obtained from the notes of Mr. Brown, the dresser of the patient.

Ann F——, a widow, sixty years of age, following the

\* See a case of this kind treated by Mr. Erichsen at University College Hospital, the wound having been inflicted with a large knife. (*THE LANCET*, vol. II., 1851, p. 414.)

occupation of a basket-woman, was admitted June 1st, 1854, under the care of Mr. Erichsen.

The patient states that she has had hernia for two years, the bowel usually going up of itself, but coming down again when she walked. She never wore a truss, and was in the habit of carrying heavy loads on her head. Four days before admission, the hernia protruded when the patient returned from market, but the swelling was quite soft, and the bowels had been open in the morning. The next day the woman suddenly felt great pain at the umbilicus, was seized with retching, and during the efforts the hernial tumour increased in size. The pain went on the whole day, nothing being, however, thrown off the stomach, though the retching was very violent. For the two following days the symptoms remained unabated, and the patient threw up everything she took; she, in fact, was in such distress, that the surgeon who was consulted sent her here.

*State on admission.*—Pulse weak, 96, regular, and soft; tongue slightly furred; over the right saphenous opening there is an oval, elastic, tense swelling, the skin covering it having a brown tint; the tumour is very tender on pressure, and no impulse is conveyed by coughing. No crepitation nor gurgling are heard on handling it; pressure on the abdomen gives pain, but the neighbourhood of the swelling is not more sensitive than the rest of the surface. The knees are not drawn up; there is no hiccup; the breathing is regular; and the patient complains of a dragging pain at the umbilicus.

The woman was placed in a warm bath, and the taxis tried for about half a minute; but it was not found advisable to continue the efforts at reduction, and Mr. Erichsen determined to operate at once.

When the patient had been rendered insensible with chloroform, a crucial incision was made through the skin and cellular tissue over the neck of the tumour. The textures were found hard and thickened, and the sac was exposed after the usual dissection; on opening it, some fetid pus gushed out, and a knuckle of green and gangrenous intestine, here and there adherent to the sides of the sac by effused lymph, came into view. The coats had, however, not burst. The stricture at Gimbernat's ligament was divided as usual, but the bowel, for obvious reasons, was not returned into the abdomen, the wound was left open, and a warm poultice applied over it. Mr. Erichsen ordered half a drachm of Battley's sedative, and one grain of opium to be taken every fourth hour.

The draught was taken at two in the afternoon, and the grain of opium about one hour afterwards. The patient was very restless for a time, and took wine and beef-tea during the day.

On the next morning she was found to have slept at night, and had taken the opium and wine regularly. She had been slightly sick, and the wound was very offensive, the bowel breaking down and coming away. Hot fomentations were applied to the abdomen, as the patient complained of pain in that cavity.

When Mr. Erichsen saw the patient, he ordered the opium to be taken only every sixth hour, as the narcotic effects had been produced; some sphacelated shreds of intestines were torn and cut away with forceps and scissors. Peritonitis now occurred, and sickness supervened.

On the fourth day fecal matter escaped through the wound, with a gurgling sound during an examination. Brandy and beef-tea were ordered.

On the fifth day the inguinal anus was fully established, when a small quantity of solid meat was allowed.

On the sixth day the brandy was given in water and in a less quantity; the wound was rather tender on pressure, and to prevent burrowing downwards, a pad was put on, and kept tight with a roller. The patient was very drowsy, and the pupils contracted; pulse 90, weak; peritonitic tenderness very slight.

On the seventh day the woman had two evacuations per anum in the night, and one by the day, the matters discharged being quite healthy; no sickness.

On the ninth day, wine, which had always been rejected before, was well borne, and two evacuations per anum took place. A large portion of slough came away from the groin.

On the sixteenth day it was found that no more fecal matter passed through the wound, and the latter was in a very favourable condition, as its margins had been kept free from irritation by means of collodion. The evacuations per rectum had been regular all the while, and the nourishment had principally consisted of brandy and beef-tea. The wound healed very satisfactorily, and on the 26th of June, twenty-five days after the operation, cicatrization was complete, and the woman left the hospital in excellent condition.

## Medical Societies.

### ROYAL MEDICAL & CHIRURGICAL SOCIETY.

TUESDAY, JUNE 27, 1854.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

#### CASE OF DISTORTION OF THE SPINE, WITH OBSERVATIONS; ROTATION OF THE VERTEBRÆ AS A COMPLICATION OF LATERAL CURVATURE.

BY DR. HODGKIN AND MR. W. ADAMS.

THE early history of this patient, the well-known Gideon Mantell, and the symptoms of the disease from which he suffered so long, were given by the first author. It appears that considerable doubts existed in the minds of Dr. Mantell's professional friends as to the exact nature of the affection, but by many it was supposed to be a lumbar abscess, connected in all probability with caries of some of the vertebræ; others, feeling a prominent swelling, partly hard and partly fluctuating, in the lumbar region, concluded that there was a tumour of doubtful character. The patient used to suffer most excruciating agony. After death it was ascertained by Mr. Adams that there was no disease either of the bones or the intervertebral substances; that there was no trace of any abscess, all the surrounding tissues being quite healthy; but the vertebræ were twisted in such a way that, with considerable lateral curvature, there existed a backward projection of the lumbar transverse processes, to an extent sufficient to form a prominence. The spinous processes were in their proper relations to one another. A very accurate description of the dissection was followed by general remarks upon this form of disease.

#### ON THE PATHOLOGICAL CHANGES OCCURRING IN CERTAIN DEVITALIZED TISSUES.

BY GEORGE ROBINSON, M.D., ETC.,  
Newcastle-on-Tyne.

IN this communication the author offered some observations on the general character of those pathological changes denominated softening, contraction or diminished bulk, induration, fatty degeneration, and calcareous degeneration. The subordination of ordinary chemical laws to the superior controlling powers of life was one of the most interesting and important principles of physiology; and modern pathology had now established the converse of this proposition, by demonstrating that the partial or complete destruction of their inherent vital powers again subjected to the general laws of matter the structures thus morbidly affected. Having detailed the ordinary features of the pathological changes above enumerated, the author referred to some of his researches, published in the "Transactions" for 1843, having for their object an investigation into the immediate effects of obstructed circulation in the kidney. He then proceeded to describe the effects produced by ligation of the renal vein or artery. The kidney became enveloped in a cyst, formed by the surrounding cellular tissue, infiltrated with blood and lymph. In the interior of this cyst, the kidney, deprived of vitality, underwent a process of liquefying or softening. He found that under certain circumstances this protecting cyst was not formed; whilst in some instances the kidney which had undergone congestion, and un-surrounded by a cyst, exhibited merely atrophy, or contraction and induration. In some experiments, where the kidney had thus become atrophied, fat-globules were detected, exhibiting the character of fatty degeneration. Calcareous degeneration had also been noticed as the effect of ligation of the renal artery. Some experiments made on rabbits, by tying the renal vein and artery, were then detailed, and the results illustrated by some models. The effects produced by these ligatures were referred by the author to an impaired vitality, and he thought them strictly analogous to those pathological conditions above enumerated, which were characteristic of a devitalization of the tissues.

#### CASE OF DEFORMITY IN AN INFANT.

BY C. J. B. ALDIS, M.D., ETC.

THIS was a case of a double hare-lip, complicated with cleft palate. The infant only survived eleven hours, and died convulsed. The dissection was made by Mr. Cooper, student of anatomy at the College of Surgeons, and was very carefully and minutely detailed. The case was illustrated by a drawing.

The central pendant lobe was found to consist of two separate portions of bone, connected in the centre, and each contained well-formed incisor teeth. These teeth had particularly well-marked the three small "cusps" which usually distinguish the incisor teeth in the infant; a small second tooth on the left side of the central lobe had them also. The two lateral incisors had not a perfect alveolus in the superior maxillary bone, but their existence at all in connexion with that bone was highly singular, and unless considered altogether as an exceptional case, the fact would seem to throw some doubt on the assumed separation in man of an inter-maxillary bone corresponding to that found in the mammalia generally.

ON THE DEVELOPMENT AND SIGNIFICATION OF VIBRIO UREOLAE, BODO URINARIAE, AND ON CERTAIN FUNGOID AND OTHER ORGANIC PRODUCTS GENERATED IN ALKALINE AND ALBUMINOUS URINE.

BY ARTHUR H. HASSALL, M.D., ETC.

THE author having first given a description of the vibrios of the urine, enumerated the causes and conditions under which they were developed. The following were the conclusions arrived at:—

1. That vibrios are not developed in strongly acid urines so long as these retain their decided acidity.
2. That so soon as such urines have lost a considerable part of their acidity, and have become but feebly acid, vibrios begin then to appear. It is thus that the occurrence of both torulae and vibrios in the same urine is explained. While the urine is strongly acid the torulae are formed, but as soon as the acidity becomes greatly reduced, the vibrios make their appearance.
3. That vibrios are invariably developed in different proportions in all those urines which are either feebly acid, neutral, or more particularly alkaline.
4. That the greatest development of vibrios takes place in all those urines which contain most animal matter, as mucus, epithelium, and albumen, and which, at the same time, are decidedly alkaline. Hence, although not an exact test of the degree of alkalinity of any one sample of urine, or of the amount of animal matter (especially albumen) present, yet by their early appearance, and by the quantity developed, to a certain extent vibrios may be regarded as affording valuable information on both these heads.
5. That vibrios are most freely developed when the urine is exposed to the air.

But vibrios are not the only kind of animalcules found in urine. A second species not unfrequently occurs in great abundance, entirely different in size, form, and structure; this is the *bodo urinaria*. The author gave a minute description of this animalcule, showing that they multiplied by *stasiparous* reproduction. Some carefully executed drawings illustrated the characters of this animalcule. The author's investigations had led him to the discovery of a third kind of fungus developed in alkaline urine, entirely different from the two which had been described in a former communication. Like them, this recently discovered fungus presented three distinct stages of growth—sporules, thallus, and aerial or perfect fructification. These were severally described. The author abstained from giving this fungus a distinctive name, wishing, before doing so, to ascertain whether it had heretofore been described by any other observer.

AN EXAMPLE OF THE CONCURRENT DEVELOPMENT OF CANCER AND TUBERCLE.

BY SEPTIMUS WM. SIBLEY,  
Registrar to the Middlesex Hospital.  
(Communicated by Mr. ARNOTT.)

THIS was the case of a woman, aged forty-eight, admitted into the Middlesex Hospital, with a sloughing cancerous sore in the left breast; there was a hard tumour on the inner side of the size of an orange, and several small nodules of cancer at its edges. In the course of five days after her admission nearly the whole remaining portion of the tumour sloughed away, leaving a clean-looking surface, which immediately began to cicatrize. Subsequently, pulmonary symptoms became developed, profuse expectoration followed, and she sank and died three months after her admission. On making a section of the structure of the left breast, it was seen to be an extremely dense form of infiltrating scirrhous, traces of breast tissue, such as ducts, being very apparent. In the thorax, large masses of tuberculous lung tissue was observed. Tubercular cavities existed in the apices of both lungs; a part of the lower lobe of the right lung was in a state of grey hepatization, and the bronchial tubes were thickened and dilated. In the left

pleura were numerous crude tubercles. On examining the dates of this case, positive proof was obtained that a cancerous tumour was increasing in the breast simultaneously with the increase of tubercular disease of the lungs, and that for a period of at least six weeks. The author thought that a single instance of the concurrent existence of these diseases was sufficient to destroy the doctrine of the absolute incompatibility of tubercle and cancer with each other. The paper concluded with some appropriate remarks on the constitutional diathesis tending to the concurrent development of these two diseases.

(To be concluded.)

Contemporary Medical Literature.

THE VENOM OF SERPENTS.

DR. J. GILMAN arrives at the following conclusions:—1. That the venom of all serpents acts as a poison in a similar manner. 2. That the venom of some varieties is far more active than that of others. 3. That a variety of the *coluber*, known as the "cotton-mouth," is the most venomous serpent in Arkansas. 4. That the venom of serpents destroys all forms of organized life, vegetable as well as animal. 5. That alcohol, if brought into contact with the venom, is, to a certain extent, an antidote. 6. That serpents do possess the power of fascinating small animals. 7. That the blood of small animals destroyed by the venom of serpents, bears a close resemblance to that of animals destroyed by lightning or hydrocyanic acid; it loses its power of coagulation, and cannot be kept long from putrefaction.—*St. Louis Medical and Surgical Journal*.

WEIGHT OF THE BRAIN.

The brain of the late Senator Atherton, of New Hampshire, weighed fifty-six ounces and a half, avoirdupois, which is seven ounces and a quarter less than the weight of Mr. Webster's, or little more than that of Spurzheim, and seven ounces more than that of Dupuytren. Cuvier's brain weighed sixty-four ounces and a quarter, and Abercrombie's sixty-three.—*Philadelphia Medical and Surgical Journal*.

ERYSIPELAS.

Erysipelas has usually been described as an unhealthy inflammation of the skin alone, or of the skin and sub-cutaneous areolar or cellular tissue; but this is too limited a description of the disease, for erysipelas is not invariably confined to the surface of the body, but may spread from the face to the throat, and to the larynx and bronchial tubes; it may migrate from the fauces to the pharynx and lining membrane of the gastrointestinal canal, or it may, on the other hand, suddenly leave the surface of the body and attack the brain or its membranes, leading thereby to special, and not infrequently fatal, forms of internal inflammation.....The danger in erysipelas is not to be reckoned so much by the extent of the local inflammation as by the amount and type of its accompanying fever.—Dr. HUGHES in *Dublin Hospital Gazette*.

PERICARDITIS.

The invasion of this disease when ptialism is established, proves how groundless is the opinion of Niemann and others, that the mercurial treatment of rheumatism carried to such an extent has any power in preventing those formidable complications, which so often are the starting points of structural change in the heart, rendering it one of the most dangerous diseases, at least in its remote and probable termination.—Dr. BANKS, *op. cit.*

ALBUMINURIA.

It is a curious fact that patients affected with this disease are very liable to secondary hæmorrhage after operations or any injury. This is probably due to the peculiar morbid state of the blood inseparable from this condition of the system, as it is highly acidified by the urea circulating in it, and the divided vessels do not appear to close by the usual process of coagulation and adhesion, probably owing to the deficiency of albumen. It has also been observed that women who are the subjects of this disease are very liable to severe hæmorrhages after delivery.—Dr. LEES, *et supra*.

# THE LANCET.

LONDON: SATURDAY, JULY 8, 1854.

At the hour of going to press with this number of our journal, the extraordinary inquiry relative to the death of the child, ALFRED RICHARDSON, will stand adjourned to ten o'clock on Friday morning, the 7th instant. In the next LANCET we hope to be enabled to present our readers with a condensed summary of the evidence.

In the present number we publish entire Sir JOHN FORBES' scheme of Medical Reform. Placed by this means before the entire body of the profession, every opportunity will be afforded for thoroughly examining its principles and details. As there is not the shadow of a probability that the measure will be adopted by Parliament in the present session, we do not feel called upon to pronounce at once any decided opinion upon it. We are only anxious that this scheme, like every other, should be fairly considered. Some of its provisions, no doubt, represent the feelings of the profession; others, especially those framed upon the ideas of Sir JAMES GRAHAM,—a statesman whose greatest claims to public respect are certainly not those based upon his views relating to the medical profession,—will be scrutinized with jealousy. The paramount authority it is proposed to cede to the Colleges, to the prejudice of the Universities, is a point deserving of cautious deliberation.

The constitution of the Councils we regard as highly objectionable and defective, and the proposal to establish two in Scotland, whilst one is considered sufficient for England,—a section of the empire probably not less important,—and one for Ireland, is incomprehensible. The pretensions of the numerous corporations north of the Tweed are sufficiently extravagant, and have always presented some of the main difficulties in the settlement of the vexed question of Medical Reform; but we are not at present in possession of any adequate reasons to show why their assent should be purchased by the concession of one Medical Council to Glasgow and another to Edinburgh. If Glasgow is to have a Medical Council, because Glasgow has a Faculty of Physicians and Surgeons, we cannot help thinking that the said Faculty is *de trop*. However, we have said that it is not our intention at present to enter into a minute appreciation of this scheme. We therefore leave it for discussion and comparison with the other plans before the profession.

We cannot but think that Lord LYTTLTON, in his conduct of the Vaccination Extension Act, and subsequently of the Amendment Bill rendered necessary by the imperfections of that Act, has not evinced that degree of deliberation befitting the legislative character, or that courtesy towards the medical profession which, in a matter of this nature, is certainly their due. Why is it that the Act passed only last session is already found so little adapted for working that it must be amended? Simply because Lord LYTTLTON'S knowledge of the subject was not equal to the benevolence of his intentions, and his eagerness to carry his excellent intentions into effect was too

great to allow him to wait for information from the only quarter—the general practitioners of this country—competent to instruct him. The short experience of the operation of the Act of last year has clearly proved that the Act was ill-digested, and altogether ineffectual in practice. His Lordship has received ample evidence to convince him that his Act might have been framed in a manner more calculated to promote its ends; and some credit is due to him for his candour and promptitude in undertaking to amend it. For all the amendments he has embodied in his new Bill, he is indebted to suggestions addressed to him by medical practitioners, and enforced by ourselves and our correspondents in this journal. It might have occurred to him that it was at least desirable, with a view to obviate the necessity of a second Amendment Act next year, if not as a measure becoming in itself and due to the profession, to lay his amendments fairly before the medical world, affording ample time for their consideration. We do not think that the Bill would have been impaired in its efficiency, or that his Lordship's reputation as a statesman would have suffered by this course. The medical profession cannot but be deeply alive to the importance of the end in view, and anxious to aid in carrying it out. They have evinced the most disinterested zeal in the matter, by heartily endeavouring to promote the success of an Act, most defective in its technical construction, and conceived in a spirit, to say the least, somewhat injurious to themselves. Notwithstanding all this, Lord LYTTLTON has hurried his new Bill through the House of Lords with such speed as to afford no opportunity for the discussion of its principles or details. It is already in the House of Commons, and Mr. BRADY has given notice of his intention to move certain amendments in Committee.

It may fairly be questioned whether the amendments of Lord LYTTLTON will remove all the obstacles to the effective working of the measure. As far as these amendments go, we have no great objection to offer. We doubt whether they will prove equal to the attainment of the object proposed.

The first proposition is, that the guardians or overseers shall provide and pay for special vaccination stations. The second provides that the child shall be brought for inspection to the medical practitioner on the *seventh* day after vaccination, instead of the *eighth*, as in the Act of last session.

It is proposed to remove one great defect by enabling any qualified medical man, whether appointed by the guardians or not, to receive a fee for successful cases of vaccination: but the fee named—one shilling—is offensively insufficient. The fee of the registrar is raised from threepence to sixpence.

An important amendment is that which supplies the omission to provide for the enforcement of vaccination. It was soon discovered that, although penalties were denounced against recalcitrant parents, unless some persons were specially empowered to prosecute, the penal clause was a mere *brutum fulmen*. The guardians and overseers are to be empowered to direct prosecutions.

We have thus pointed to all the important alterations contained in the Vaccination Act Amendment Bill. We trust there is still time to consider how far they are likely to be sufficient; and invite for them the careful and immediate attention of those who are the most practical and competent judges of the merits of the measure, and the persons to whom the executive charge of the measure must be entrusted.

WHENEVER of late years the question of dealing with illegal practitioners has been discussed in this journal, it has always been contended that the laws at present in force, are sufficiently stringent to punish, by an inexpensive process, all persons practising as "Apothecaries," without legal qualification. It is to the credit of the County Court judges, that in every instance which has come before them, based on legal evidence, a conviction has ensued. In every case of failure, the non-success of the prosecution has been owing to the incomplete nature of the case submitted to the judge. It is not for one moment attempted to defend the incompleteness of the law relating to unqualified practitioners. It is a disgrace to the legislature that at this very moment there is no statute or other law which prevents a man from calling himself a surgeon, and practising as such, without the least fear of punishment, although he may have not the slightest claim to be regarded as qualified for the position which he assumes. It is true that the College of Physicians possess the power of punishing, under certain restrictions, unprincipled persons for practising physic without a license from that body. The manner, however, in which they have exercised this power, has rather tended to show that they have abused the authority with which the law has invested them. Instead of proceeding boldly against the quacks and impostors who profess to be "physicians," all the prosecutions which they have instituted against persons not belonging to their own body, have resulted from petty jealousies against rival institutions, and have been promoted against men in every other respect worthy of being regarded as legitimate practitioners. We are unacquainted with a single instance during the present century in which the College have exercised their undoubted privilege of punishing a quack. They have amongst their own Fellows homœopaths, hydropaths, mesmerists, and other charlatans, whom, instead of prosecuting, as they should do, they have delighted to honour.

If we turn to the College of Surgeons, the result is not more satisfactory. Men who are a disgrace to any profession, who have violated the sacred oath which they took upon being enrolled members of that institution, are permitted, without even a remonstrance, to continue upon the roll of that honourable institution. Lawyers act upon a different principle. The authorities which control that profession do not hesitate to brand with disgrace an unworthy and unscrupulous member. The records of our courts of law abound in applications for striking off the rolls members of the legal profession who have acted contrary to the spirit and practice of the body to which they belong. So jealous are they, indeed, of the prestige which belongs to the very name of lawyer, that any man who has been proved to have assumed that name without a legal title to possess it, has been summarily convicted and punished. In the present unsatisfactory state of the laws which regulate the medical profession, we cannot expect any such desirable result. For thirty years we have attempted to remedy this most serious defect. Hitherto our efforts have not met with that success which the justice of their object has deserved. Not that any one possessed of the slightest pretension to be regarded as an authority has denied the necessity of such a power—not that the Legislature has been unwilling to listen to the just claims of legitimate practitioners—but that the Colleges themselves, actuated by the lowest and most interested motives, have opposed the salutary change. It cannot be supposed for a single

moment that, had the Colleges exercised the power which they undoubtedly possess, the impostors which crowd our ranks would still remain a disgrace and an opprobrium on our noble profession. It is only just to the Society of Apothecaries to state, that upon every occasion on which a clear case of infringement of the Apothecaries' Act has been brought before them, they have readily and cheerfully lent their aid to punish the offender. In this respect they have formed a remarkable contrast to the other governing bodies. The case of the Apothecaries' Company v. Dixon, recorded at page 20, is a satisfactory instance in point. It is a good illustration of the view which judges are inclined to take of the provisions of the Apothecaries' Act, notwithstanding the legal technicalities and contemptible subterfuges to which the defendant may resort. We believe that the profession are indebted, in this particular instance, for the success of the prosecution to the Council of the Medical Protection Society. It is highly honourable to that body, and we trust that it is only their commencement of a crusade against unprincipled and unqualified practitioners.

A word with respect to the position of the Society of Apothecaries and the Medical Protection Society, in matters of this description. Complaints constantly reach us of unqualified men practising medicine bringing disgrace upon the profession, and depriving the legitimate practitioner of his means of support. Who is to blame? The Apothecaries' Company have issued instructions to their members to guide them in gaining a conviction against their unprincipled opponents. "Give us evidence," they say, "which will convict the offender, and we will prosecute; but it is too much to expect that we can take upon ourselves to prove the offence in every case, and we naturally look to you to furnish us with the necessary proof. Fully impressed with the gravity and importance of the power with which we have been intrusted, we are most anxious, for the sake of our members and licentiates, that no case shall be brought before the legal tribunals of the country without a moral certainty of the evidence being sufficient to convict the offender. We ask you, then, to supply that evidence. Should you fail to do so, what right have you to complain that we do not aid and protect you? Every failure in such a cause only tends to strengthen the enemy. Many victories scarcely compensate for a single instance of non-success." It is surely possible to form a Medical Association in every district in the kingdom, having for its object the suppression of illegal practice. Let such associations be formed, and it is not difficult to predict what must be the result. But, if those immediately interested are not sufficiently alive to their own interests to form such organizations, let us have no more complaints against the law or the Society, but rather let us say, that, although the injured parties have the power in their own hands, they have neither the courage nor the will to exert it.

THE cause of Free Education and the cause of Civil and Religious Liberty have jointly achieved a memorable triumph. We have often had occasion to point out in how many ways the progress of Medicine has been retarded, and how unworthily many of the most able of our brethren have been persecuted, through the exclusive sectarian system of the ecclesiastical universities, and the connexion of these universities with the College of Physicians. The conduct of Pope Pius V., in interdicting physicians from giving any medical

relief to persons who declined spiritual attendance, or the conduct of the Tuscan Government in our own day, which compels practitioners of medicine to inquire into the religious creed of their patients, with a view to reporting their heresy to the police, are manifestations of intolerance more revolting, indeed, but not more absurd or pernicious in principle, than the attempt to recognise that medicine only as orthodox which is professed by a subscriber to the Thirty-nine Articles. The custom at Cambridge is to oppose no religious obstacle or test at the entrance of a student. The authorities of the College which he enters may, however, harass the non-conformist by requiring him to attend at chapel every morning to listen to, and to take part in, doctrines and ceremonies which he may believe to be wrong. If, however, he is prepared to submit to this kind of orthodox drilling throughout the necessary period of study, he cannot escape the crucial test of the Thirty-nine Articles before being admitted to take his degree. At Oxford the non-conformist is treated at the very outset as a malignant, unfit to receive instruction or to acquire a degree. The crucial test is put to the student *in limine*; and if his understanding cannot fathom the meaning of thirty-nine distinct theological propositions, and make them harmonize with each other, or if in his conscience he cannot give in his adhesion to them, he is at once turned away from a fountain of knowledge, the pure stream of which he cannot be permitted to taste, unless he at the same time consent to imbibe certain doctrinal adulterations.

By two distinct votes of the House of Commons, Mr. HEYWOOD has established—1st, that the imposition of the religious test at the entry of students at Oxford shall be abolished; 2ndly, that the religious test shall no longer be a bar to admission to the degree of B.A. Great as is the triumph, it cannot, however, be regarded as complete. It is expressly reserved that the non-conforming Bachelor shall go no further in academical honours and power. The stigma of intolerance and injustice still adheres to seats of education which should be national and free. Although the Bachelor of Arts' degree may serve the purpose of the lawyer, there is, under this provision, no emancipation for Medicine. The true *alma mater* of the healing art is still the University of London; and the University of London has still to ask for those academical and civil rights which Oxford and Cambridge enjoy.

## SCHEME OF A BILL

FOR

### REGULATING THE MEDICAL PROFESSION IN GREAT BRITAIN AND IRELAND.

[The following sketch of a Medical Bill, although avowedly founded on the Bills introduced into Parliament by Sir James Graham in 1844 and 1845, contains so many alterations and additions that it may be almost considered as a new measure; and the compiler is not without hopes that, such as it is, it may be found more acceptable to the corporations, and to the profession generally, than any Bill previously proposed. It is printed in its present incomplete state for the purpose of being submitted to the various medical corporations, and to friends deemed competent to deal with such subjects, and in the hope that it may elicit from these sources such comments, criticisms, and suggestions as may render it much more perfect than it is. If the compiler is favoured with any communications of this kind, (which he earnestly entreats,) and with anything like a general approval of his scheme, it is his purpose, after availing himself of such of the suggestions received as he may deem improvements, to place his matured views in the hands of

some learned counsel conversant with such business, in order that a Bill may be framed fitted for presentation to the Legislature, and which may, at least, be read a first time and printed, if it cannot be passed into a law, in the present session of Parliament.

It has been with much regret that the author of this sketch of a Bill has found it impracticable to comprise within his scheme of examination and license the Society of Apothecaries of London and the Apothecaries' Hall of Ireland; more particularly the former, which has, for so many years, successfully exerted itself in improving the education and in promoting the general respectability of the class of general practitioners. It is, however, to be hoped that the members of this highly respectable corporation, which has always taken so disinterested a position in regard to medical reform, may see in the present measure sufficient evidence of benefit to their clients to induce them not merely not to oppose it, but to give it the important advantage of their concurrence and assistance.

May 31st, 1854.

J. F.]

*Preamble.*—Whereas it would be for the good of her Majesty's subjects in general, and tend greatly to promote harmony and goodwill among that class of them who are employed in the practice of physic, that all persons belonging to the medical profession should receive a full and sufficient education, both general and professional, and that means should be afforded whereby those who have received such education, and who have been examined and found skilful by competent authority, might be known from ignorant and unskilful pretenders to the same knowledge, and also that persons so qualified should be permitted to follow and exercise their profession under equal and fair conditions, in any part of the British dominions:

Be it therefore enacted, by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in this present Parliament assembled, and by the authority of the same:—

1. *Acts Repealed.*—That an Act passed in the third year of the reign of King Henry the Eighth [here enumerate all the Acts or parts of Acts to be repealed] shall be repealed, but not so as to revive any Act or Charter, or part of any Act or Charter repealed by the Acts herein repealed, or any of them.

2. *Medical Council.*—And be it enacted, that a council shall be established, which shall be styled the "Medical Council for Great Britain and Ireland," and that one of her Majesty's principal Secretaries of State shall be empowered, from time to time, to nominate as president of the said council some member of the Imperial legislature, who shall hold office for three years only, but shall be capable of immediate re-nomination by the said Secretary of State, if he is still at the time of such re-nomination a member of the legislature aforesaid.

3. *Constitution and Appointment of Council.*—And be it enacted, that the other members of the said council shall be fourteen in number, and shall be chosen and appointed as follows—to wit:

One person to be chosen by each of the seven following colleges or corporations—to wit: the Royal College of Physicians of London, the Royal College of Surgeons of England, the King's and Queen's College of Physicians in Ireland, the Royal College of Surgeons in Ireland, the Royal College of Physicians in Edinburgh, the Royal College of Surgeons in Edinburgh, the Faculty of Physicians and Surgeons in Glasgow; and seven other persons to be chosen by the president from the medical practitioners of England, Ireland, and Scotland, who shall have been registered, as hereinafter mentioned, during three successive years, except in the case of the first council, the members of which shall be chosen from practitioners of three years' standing, who shall be qualified to be registered according to the provisions of this Act; provided always, that no person belonging to the council or governing body of any one of the before-named colleges or corporations shall be chosen by the president a member of the said council, and that [four—five] of the seven members so chosen by the president shall belong to that class of practitioners commonly denominated "general practitioners."\*

\* [Alternative scheme for electing the members of council not returned by the corporations.

And be it enacted, that the manner of electing the seven members of council to be chosen by the registered practitioners of England, Ireland, and Scotland, respectively, shall be as follows: to wit: Forty-two days before the day fixed for the election, the registrars or local secretaries for England, Ireland, and Scotland, respectively, shall notify, by advertisement, in two at least of the most widely-circulated newspapers, and in two of the principal weekly medical journals in England, Ireland, and Scotland, respectively, that the election of the councillors to be chosen by the registered practitioners, whose names have been three years on the register, will take place on the day named, as aforesaid; in London for the members to be chosen by the practitioners in England; in Dublin, for members to be chosen by the practitioners in Ireland; and in

4. *Tenure of Office by Members of Council.*—And be it enacted, that at the expiration of three years from the time of their nomination and election, all the members of the said first council, and of every council subsequently elected, shall go out of office, but may forthwith be re-chosen or re-appointed as aforesaid by the colleges and by the president respectively.

5. *Place of Meeting of Council.*—And be it enacted, that during the first year after the establishment of the council, the members thereof shall meet in London in such place as may be appointed for them, and as often as the president and council may think requisite; but that, after the expiration of the first year, it shall be lawful for the council to meet in Dublin or in Edinburgh, as the president and council from time to time may determine.

6. *Appointment of Vice-President—Quorum.*—And be it enacted, that the president shall nominate from time to time one of the members of the council to be vice-president to act for him in his absence, and that in the absence of the president and vice-president the council shall elect a chairman for the occasion from the members present, the president or chairman for the time being having a casting vote over and above his vote as a member; and no business shall be transacted at any meeting of the council unless five members be present.

7. *Salaries and Expenses.*—And be it enacted, that there shall be paid to each member of the said council for each day's attendance at its meetings such sum as may from time to time be deemed adequate by one of her Majesty's principal Secretaries of State, and also such reasonable allowance for travelling expenses incurred by any member in the execution of the duties of his office, as the said Secretary of State may from time to time determine.

8. *Permanent Committee.*—And be it enacted, that it shall be lawful for the council, from time to time, to appoint a committee of its own members, three in number, to act in concert with the several registrars to be appointed as hereinafter mentioned, in the intervals of the meetings of the said council, and for the conducting such business as the council at any of its meetings may entrust to the said registrars and such committee; and the members of the said committee shall be nominated to serve for one year only, but to be immediately re-eligible for the same office, and shall be paid such reasonable salary as to the president and council may seem fit.

9. *Appointment of Registrars, &c.*—And be it enacted, that the members of the said council shall within a month after their first meeting elect a fit and proper person to be their treasurer, and also another fit and proper person, being a registered medical man or one qualified to be registered under the provisions of this Act, to be their secretary, who shall also be the registrar for England; and shall elect secretaries for Scotland and Ireland, being registered medical men, or men qualified to be registered under the provisions of this Act, who shall be the registrars for these countries respectively; and also so many clerks and messengers as may be deemed necessary by the said council; and the said council shall be empowered to remove any treasurer and any of the said secretaries, registrars, clerks, and messengers, and appoint others in their room, and to pay to the said treasurer, secretaries, registrars, clerks, and messengers, such salaries as the council shall deem proper, and also such reasonable travelling expenses as may have been incurred by them or any of them in the performance of their duties under this Act.

10. *Minutes of Proceedings.*—And be it enacted, that minutes of the proceedings at all meetings of the council shall be drawn up and fairly entered in books to be kept for that purpose; and such minutes shall be at all times open to the

Edinburgh, for the members to be chosen by the practitioners of Scotland; provided always, that no person shall be deemed eligible for election unless he shall have been recommended in a writing transmitted to the registrar of the country where the election is to take place, twenty-one days before the day of election, and signed by at least twenty members qualified to vote, and who shall subscribe their names to such writing; and unless the name of such person shall have been published in the newspapers and medical journals, as aforesaid, together with the names of all persons so recommended, fourteen days at least before the day of election; and each such election shall take place between the hours of nine in the forenoon and four in the afternoon, at such place as may be named in the said advertisements, and before the secretary and registrar of each country respectively, together with two members of the out-going council selected by the council, and shall be conducted by means of balloting-papers, to be delivered personally by the voter, or transmitted by post, duly authenticated by the signature of the voter; and the two persons in Ireland, and the two persons in Scotland, and the four persons in England, having the greatest number of votes, shall be declared elected; and in case of an equality in the number of votes for any two or more persons, at any such election for members of council, the registrar shall ballot out of the said number of persons having such equal number of votes, as aforesaid, so many as shall be necessary to complete the whole number of councillors to be elected; provided always, that out of the eight members so chosen by ballot, not more nor less than five shall belong to that class of surgeons commonly denominated "general practitioners."

inspection of any registered physician or surgeon deputed by any of the medical colleges or corporations aforesaid, or to any registered physician or surgeon of three years' standing on the register, who may transmit to the council a written application to that effect, signed by himself and five other registered practitioners of the same standing on the register.

11. *Application of Funds.*—And be it enacted, that all monies received by the council, and by the secretaries, and registrars in their respective offices, shall be paid over to the treasurer by the authority of the council, and shall be applied to defray the expenses of carrying this act into execution; and the council shall, once in every year, publish an account of their income and expenditure for the year then past, and shall cause their secretary to transmit a copy of such account to one of her Majesty's principal Secretaries of State.

12. *Curriculum of Study.*—And be it enacted, that no candidate shall be deemed eligible for examination by any of the medical examination boards hereinafter mentioned, who shall not produce satisfactory evidence that he has completed his twenty-second year, and that subsequently to the completion of his seventeenth year he has passed, at least, four years in some medical school or schools approved by the medical council, unless he shall have been an articled pupil to a registered practitioner for at least two years subsequently to the completion of his seventeenth year, or unless he shall have obtained the degree of Bachelor or Doctor of Medicine from some university approved by the council, in either of which cases a curriculum, or course of three years shall be deemed sufficient to qualify him for examination: nor shall any candidate be deemed eligible for examination who has not attended such courses of dissection, such clinical and other lectures, and such hospital practice, as shall have been from time to time determined by the medical council.

13. *For securing Efficiency of Study and Examination.*—And with a view to enable the council to enforce on students the observance of such courses of study as the council may from time to time lay down for them, and to enable the council to ascertain whether the testing of the qualifications of candidates for the license be effective and uniform in the three countries: Be it enacted, that the council shall have the right to demand of every examination board that the certificates of attendance on lectures and hospitals presented to it by candidates for examination, shall be transmitted to the council, and that the council shall also be empowered to depute any one or more of its members, being a medical man, or medical man, to be present at any of the examinations, and report to the council; and if the council shall, upon such report or otherwise, be of opinion that any examination board has admitted to examination persons of improper age or with an imperfect course of study, or that the rules laid down by the said council for the adequate examination of candidates have been infringed, evaded, or neglected, by any of the said examining bodies, it shall be lawful for the council on the refusal of such examination board, after due admonition to amend what is defective in its proceedings, to take such further steps as may be requisite to remove the defects complained of.

14. *Preliminary Examination Board.*—And be it enacted, that there shall be established in London, Dublin, Edinburgh, and Glasgow, respectively, an examination board, to be termed the Preliminary Examination Board, for the examination of students at the commencement, and during the progress, of their medical studies, the members of which board shall be nominated by the medical council in such number and with such salaries as the said council may from time to time determine; and any or all of the members of such preliminary board may be removed at any time by the said council, and others appointed in their room.

15. *Preliminary Examination of Students.*—And be it enacted, that no person shall be considered to have commenced his medical curriculum, according to the provisions of this Act, unless, subsequently to the completion of his seventeenth year, he has passed an examination before the preliminary examination board, such examination having for its object the testing of the student's knowledge of ancient and modern languages, arithmetic, geometry, mathematics, physics, and such other branches of general knowledge as the council may from time to time determine, the amount of proficiency in any or all the subjects of the said examination required of the student to be also from time to time determined by the council; provided always, that any person who shall give proof of having undergone the matriculation examination in any British University, shall be exempt from undergoing the aforesaid preliminary examination.

16. *Subjects of Examination by the Preliminary Board.*—And be it enacted, that every student after the completion of

his first year's attendance in any recognised medical school, shall pass a second examination before the preliminary board, such examination having for its object the testing the amount of knowledge acquired by the student during the preceding year, and such examination shall comprise the following subjects—to wit, chemistry, botany, materia medica, pharmacy, and the rudiments of anatomy, and such other subjects as the council may from time to time determine.

17. *Preliminary Examinations at the Provincial Schools.*—And be it enacted, that it shall be lawful for any student desirous of prosecuting his medical studies in any recognised school other than those situated in London, Dublin, Edinburgh, or Glasgow, to take his first preliminary examination as aforesaid in the city or town in which such medical school is situated, before examiners appointed by the authorities of such school, and approved of by the council; but it shall be imperative on all students to undergo their second preliminary examination at the termination of their first year's studies, before some one of the preliminary boards appointed by the council, as hereinbefore stated, in London, Dublin, Edinburgh, or Glasgow.

18. *Medical Examination Boards and Subjects of Examination.*—And be it enacted, that the medical examination boards for testing the qualification of candidates for registration after the completion of their medical curriculum as laid down in this Act, shall be the ordinary examination boards of the existing medical colleges or corporations in London, Dublin, Edinburgh, and Glasgow, or examination boards specially nominated for this purpose by the said colleges respectively—to wit, 1. For England, the Royal College of Physicians of London, and the Royal College of Surgeons of England; 2. For Ireland, the King's and Queen's College of Physicians in Dublin, and the Royal College of Surgeons in Dublin; 3. For Scotland, the Royal College of Surgeons in Edinburgh, and the Royal College of Physicians in Edinburgh; and 4. The Faculty of Physicians and Surgeons of Glasgow; and the examination or examinations before the said Colleges of Surgeons shall comprise the subjects of anatomy, physiology, surgery, and midwifery; and the examination or examinations before the said Colleges of Physicians shall comprise the subject of scientific and practical medicine, technically so called in contradistinction to surgery, and the sciences wherewith medicine is essentially connected.

19. *Examination Fees.*—And be it enacted, that the fee for the surgical and for the medical examinations aforesaid, shall be the same in each college, and the amount of the said fee shall from time to time be fixed by the colleges and the council conjointly.

20. *Faculty of Glasgow.*—And be it enacted, that, for the purposes of this Act, the Faculty of Physicians and Surgeons of Glasgow shall be considered as a College of Surgeons and a College of Physicians, and the examinations in medicine and surgery prescribed in this Act to take place before such colleges shall take place in it before two sets of examiners, one for surgery and one for medicine.

21. *Age and Qualification of Candidates for Examination.*—And be it enacted, that no person shall be allowed to present himself for examination before the aforesaid medical boards who shall not present documents to prove that he is of the full age of twenty-two years, and that he has completed the curriculum of medical study laid down in this Act, and has attended the lectures, dissections, and hospital practice enjoined, from time to time, by the medical council; and no person shall be allowed to undergo the examination before the College of Surgeons who is not possessed of documents from the preliminary board, certifying to his having passed the aforesaid two examinations before that board; and no one shall be allowed to undergo the examination before the College of Physicians who is not possessed of the aforesaid documents from the preliminary board, and also of a document to the same effect from the examination board of the College of Surgeons; and if any candidate presenting himself for examination before any one of the aforesaid boards shall fail to pass the same, he shall be remanded to his studies for such period as that board may direct, at the expiration of which period he may again present himself for examination, but may be remanded for a further period or periods, until such time as his examination proves satisfactory to the said board.

22. *Qualifications for becoming Surgeons.*—And be it enacted, that any candidate who has passed the aforesaid examinations, before the preliminary and medical boards, shall be entitled to claim from the College of Surgeons by which he has been examined a diploma as surgeon, and to be admitted as a member of licentiate of the same college, on paying for the said diploma such sum as may be from time to time determined by the said college with the sanction of the medical council; and any

person possessing the diploma of surgeon, obtained as aforesaid, shall be entitled to be registered as a legally-qualified practitioner, and as a surgeon, in that part of the United Kingdom in which he may apply to be registered.

23. *Qualifications for becoming Physicians.*—And be it enacted, that it shall be lawful for any person, being of the full age of twenty-six years, and having the degree of Bachelor or Doctor of Medicine from any University in Great Britain or Ireland, obtained after residence of not less than one year, or from any foreign university approved of by the council, and who shall have passed the several examinations named in the foregoing clauses of this Act, and shall give in testimonials to that effect, (with or without the diploma in surgery from the College of Surgeons,) to present himself before any one of the Colleges of Physicians of England, Ireland, or Scotland, and upon being examined by such college, and having obtained from it a diploma as licentiate or member, may claim to be registered as a physician, and as qualified to practise as a physician in that part of the kingdom where he is so registered.

24. *Persons Registered to be deemed Legally Qualified.*—And be it enacted, that a register of all persons legally qualified to practise medicine be annually published by the registrars in England, Ireland, and Scotland, respectively, under the authority of the medical council; and the presence of the name of any person in any such register shall be held sufficient evidence (until the contrary appears) that such person is legally qualified to practise in that part of the kingdom in which he is so registered, and is entitled to all the privileges and immunities belonging to persons so qualified; and the absence of the name of any person from such register shall be held as sufficient evidence (until the contrary appears) that the person bearing that name is not legally qualified to practise.

25. *Mode and Form of Registration.*—And be it enacted, that the mode and form in which the names of qualified persons shall appear in the register of each country, shall be as follows: to wit—First, there shall be one general list, containing, in alphabetical order, the names of all legally-qualified practitioners, with their respective titles, qualifications, and places of abode, such list to be entitled, "List of Legally-Qualified Medical Practitioners [in England or in Scotland, or Ireland, as the case may be];" secondly, there shall be a list of legally-qualified physicians, arranged alphabetically in two divisions, as "Fellows," or "Members," as the case may be, of the College of Physicians to which they belong; thirdly, there shall be a list of surgeons, arranged alphabetically in two divisions, as "Fellows" or "Members," as the case may be, of the College of Surgeons to which they belong.

26. *Registration of Persons already in Practice.*—Provided always, and be it enacted, that during twelve calendar months after the passing of this Act, every person legally practising or entitled to practise on the day before the passing of this Act as a physician, surgeon, or apothecary, in any part of the United Kingdom of Great Britain and Ireland, although not registered, shall continue to enjoy the same privileges and exemptions, and be qualified to be appointed to the same offices, and to practise in the same manner as if this Act had not been passed, and no further or otherwise, unless registered under this Act; and any registrar, on the application of any person legally practising or entitled, on the day before the passing of this Act, to practise as a physician, surgeon, or apothecary in any part of the said United Kingdom, shall, on receiving a fee of ten shillings, cause the name of such person to be registered and to be published in the register as a qualified physician, surgeon, or apothecary, as the case may be, on his producing to the registrar of the country in which he wishes to be registered, his diploma, license, or certificate, or such other proof as shall be satisfactory to the said registrar that, on the day before the passing of this Act, such person was so practising or legally entitled to practise, and every such person, upon being so registered, shall enjoy the same privileges and exemptions, and be qualified to be appointed to the same offices, and to practise in the same manner as persons who may have qualified themselves for registration, and been registered after the passing of this Act.

27. *Registration Fee; Renewal of Registration.*—And be it enacted, that every person who, after the passing of this Act, shall have qualified himself for registration according to the provisions of this Act, shall, on being registered as above, pay to the registrar the sum of [two—three—four] pounds, which sum shall entitle him to be registered in every subsequent year without further payment; and every person whose name shall be so registered, and who shall be desirous that his name shall continue on the published register, shall, in the month of [ ]

in every year, send to the registrar his name and place of abode and qualifications; and the registrar, having verified the returns by comparison with former registers or otherwise, shall, without any further fee, insert the name in the register for publication.

28. *Reciprocity of Practice: Surgeons.*—And be it enacted, that any person registered in any part of the United Kingdom as a surgeon, on removing with a view to practice to any other part thereof, shall be entitled to have his name enrolled in the register of the country to which he has so removed as a legally-qualified practitioner and as a surgeon, on paying a registration fee of one pound to the registrar of the country to which he has removed, and on enrolling himself as a member of the College of Surgeons of the said country; and he shall be entitled to claim of such college the diploma of membership without examination, on paying the cost of the stamp, if any, on such diploma, and the ordinary fees of office, unless the sum paid by him for his former diploma as surgeon shall have been less than that legally claimed for the diploma of the college sought to be joined, in which case the difference of amount between the sum previously paid and the sum now demanded shall be the sum to be paid for the new diploma.

29. *Reciprocity of Practice: Physicians.*—And be it enacted, that any person registered as a physician in any part of the United Kingdom, on removing with a view to practise as a physician to any other part of the United Kingdom, shall be entitled to have his name enrolled in the register of the country to which he has removed, as a legally-qualified practitioner and as a physician, without examination, on paying a registration fee of one pound, and on obtaining the diploma of membership from the College of Physicians of the country to which he has removed; and he shall be entitled to claim such diploma on paying the price of the stamp, if any, and the ordinary fees of office, unless the sum paid by him for his former diploma shall have been less than that legally claimed for the diploma of the college sought to be joined, in which case the difference of amount between the sum previously paid and the sum now demanded shall be the sum to be paid for the new diploma.

30. *Restrictions on the Grant of Reciprocity of Practice.*—And be it enacted, that in the two cases named in the two preceding clauses (28, 29), to wit, the case of a registered surgeon seeking to join the College of Surgeons, and of a registered physician seeking to join the College of Physicians of a part of the kingdom other than that in which such surgeon or physician has been registered, it shall be competent for the respective colleges sought to be joined to refuse granting their respective diplomas without examination, unless it can be shown that the person claiming such diploma without examination was, when he received his former diploma as surgeon or as physician, as the case may be, of the same age, and had gone through the same curriculum of study, and undergone the same process of examination, as are required of its own candidates by the college sought to be joined.

31. *Colleges may Obtain Alteration of Charters.*—And be it enacted, that it shall be lawful for any of the Colleges of Physicians or Surgeons named in this Act, and for the Faculty of Physicians and Surgeons of Glasgow, to obtain such alteration in their respective Charters as may be requisite to enable them to comply with the provisions of this Act.

32. *None but Registered Persons to fill Public Offices.*—And be it enacted, that no person after the passing of this Act who is not registered as aforesaid, shall be appointed to any medical or surgical office in any hospital, prison, infirmary, dispensary, school, workhouse, or other public institution in the said United Kingdom, or for the relief of the poor; and no person, after the passing of this Act, shall be appointed to any medical or surgical office in her Majesty's army or navy, or in the service of the Honourable East India Company, who is not qualified to be registered under the provisions of this Act; and wherever by law it is provided that any act shall be done by a physician or surgeon, or medical or surgical practitioner, by whatever name or title called, such provision shall be construed, after the passing of this Act, to mean a person qualified to be appointed to such medical or surgical offices as aforesaid; and the medical council shall be empowered from time to time to make regulations for specifying what institutions are to be considered public institutions within the meaning of this Act.

33. *Registered Practitioners Exempt from Serving on Juries, &c.*—And be it enacted, that all persons who shall be registered according to the provisions of this Act shall be exempt, while registered and practising, from being summoned or serving on all juries and inquests whatsoever, and from serving all corporate, parochial, ward, hundred, and township offices; but no person shall be entitled to such exemption on the ground of his

practising medicine or surgery, who is not so registered; nor shall the certificate of any such unregistered person, given after the passing of this Act, be received as the certificate of a medical or surgical practitioner in any court of law, or in any case in which by law the certificate of a medical or surgical practitioner is required.

34. *Registered Persons entitled to Demand Fees.*—And be it enacted, that all persons who shall be registered as aforesaid shall be entitled to demand and take reasonable fees for medical and surgical advice and attendance, and for medicines prescribed or administered by them to their patients throughout Great Britain and Ireland, and in all other parts of her Majesty's dominions, without other license than such registry.

35. *None but those Registered can Recover Fees, &c.*—And be it enacted, that after the passing of this Act, no person shall be entitled to recover any charge in any court of law for any medical or surgical advice, attendance, or operation, or for any medicine prescribed or administered by him, unless he shall prove upon the trial either that he is registered under this Act, or that before the passing of this Act he was legally practising or entitled to practise in the capacity in which he claims such charge, and if this Act had not been passed would have been entitled to recover such charge in that capacity.

36. *Penalty on Persons Practising without being Registered.*—And be it enacted, that every person, who, after the passing of this Act, shall act or practise as a physician, surgeon, apothecary, or licentiate in medicine, in any part of Great Britain or Ireland, without having been duly registered according to the provisions of this Act, shall, for every such offence, forfeit and pay the sum of ten pounds, to be recovered by the medical council, by action of debt in any of her Majesty's Courts of Record at Westminster.

37. *Penalty for Improperly Assuming Medical Titles.*—And be it enacted, that every unregistered person who shall wilfully and falsely pretend to be, or take or use the name or title of physician, doctor, or surgeon, or general practitioner, or apothecary, or any name, title, or addition implying that he is registered under this Act, or recognised by law as a physician, or surgeon, or apothecary, or practitioner in medicine, surgery, or midwifery, or that he is a fellow, member, or licentiate of any college to which he does not belong, shall be deemed guilty of a misdemeanour in England and Ireland, and in Scotland, of a crime and offence, and being convicted thereof, shall be punished by fine or imprisonment, or both, as the court before which he shall be convicted shall award.

38. *Expulsion from the Register for Offences.*—And be it enacted, that if any person registered under this Act, shall be convicted in England or Ireland of any felony, or in Scotland of any crime or offence inferring infamy, or the punishment of death or transportation; or if it shall be found by the judgment of any competent court that any such physician, surgeon, general practitioner, or apothecary, shall have procured the registry of his name by any fraud or false pretence, or that any such physician, surgeon, general practitioner, or apothecary, has wilfully and knowingly given any false certificate in any case in which, by law, the certificate of a physician, surgeon, general practitioner, or apothecary, is required, it shall be lawful for the medical council, on production before them of a copy or extract of the conviction or judgment of the court, duly certified under the hand of the proper officer of the court, to cause the name of such person to be erased from the register; and every person whose name shall have been so erased after such conviction or judgment as aforesaid, shall thereby forfeit and lose all the privileges of a registered medical practitioner, and shall not be entitled to have his name again inserted in that or any subsequent register, without the special license of the council, on the recommendation of the college of which he was a fellow, member, or licentiate, and shall also cease to be, and shall be disqualified from becoming while his name shall continue so erased, a fellow, member, or licentiate, as the case may be, of any Royal College of Physicians or Surgeons in any part of the said United Kingdom.

39. *Dispensations in favour of Students.*—And be it enacted, that it shall be lawful for the medical council to make regulations for dispensing with such provisions of this Act as to them shall seem fit, in favour of medical and surgical students who shall have commenced their professional studies before the passing of this Act.

40. *Reservation of the Privileges of Oxford and Cambridge.*—Provided always, and be it enacted, that nothing in this Act shall deprive either of the Universities of Oxford and Cambridge of the unrestricted right of granting licenses to practise medicine or physic in conformity with their respective charters, statutes, laws, and regulations.\*

\* This reservation in favour of the English Universities is introduced in

41. *Interpretation Clause.*—And be it enacted, that the words "medicine" and "medical," when used in this Act, shall also mean and include the words "physic," "surgery," and "surgical."

## THE HARVEIAN ORATION.

THE annual oration in honour of the great Harvey was delivered in the spacious library of the Royal College of Physicians, Pall Mall East, on Saturday last, July 1st. A number of distinguished visitors assembled, in addition to the Fellows and Members of the College. The President, Dr. Paris, presided, and amongst the visitors were observed, the Bishop of Bangor; the Bishop of Oxford; Lord Yarborough; Lord Beaumont; Sir John Hanmer, Bart., M.P.; the Revs. H. Mackenzie and Howarth; Dr. Jacob Browne; Mr. Sadlier, M.P.; Mr. Baines, M.P.; Sir Benjamin Brodie, Bart.; the President of the Royal College of Surgeons; Mr. Stanley; Mr. Travers; Mr. Cesar Hawkins, &c. The oration was delivered by Dr. Alderson, and, as usual, was in Latin, of which the following is a sketch:—

"We meet for the 200th time to commemorate the benefactions of the earliest and worthiest members of this college. The founders of this oration caused their good example to be thus recorded, that we might follow in their steps, and thereby increase the influence of the profession, and enlarge its power to do good. Let, then, the long line of benefactors pass in review before us—men whose powerful intellect, without many of our means, anticipated much of our success. Is it to be hoped that yet another strophe can be added to that meed of praise which has been yearly offered in this place, for more than forty lustra? It may, for deeds still fructify, while changing times can draw a lesson from them. We notice Halford first, as *latest*—almost one of our time—the aptest for our imitation. Halford's compeers valued, as they should, the man who strove to render his profession not only honourable but honoured. If less deeply versed in science than his successor, our present president, yet to profoundest knowledge of the art of medicine he added the choicest classical attainments, and his manners were a pattern of the most refined urbanity. No one knew so well that it was hopeless to obtain wide influence for good without the world's respect, or that the world's respect begins at the highest point of social life. By Halford's influence, the building in which we are now assembled was erected for the uses of the college. Baillie appears next, encircled by relations scarcely less distinguished than himself—Hunter, Denman, Croft—a race since honourably represented, both in law and medicine, by Denman and by Brodie. Baillie's success in practice—the greatest ever known—must be ascribed to his indomitable industry. He left his large collection of pathological anatomy to the college, and a valuable example in his devotion to that formerly neglected study. Harvey presented to the college their former habitation. During the Commonwealth the property was wrested from the Church and sold to him by public auction. The building stands yet, near St. Paul's, no mean specimen of the architecture of the times. Galston and Croone founded lectureships, and Caldwell did the same, in connexion with Lord Lumley, who was fellow of this college, and studied medicine, as was then the custom, without intent to practice. It was in these Lumleian lectures that Harvey first announced his great discovery of the circulation of the blood. Great as a philosopher, Harvey was a pecuniary benefactor, and presented to the college his patrimonial inheritance of land in Kent. Do we inquire where was the spark of truth first lighted which dispelled so much error? Trained first at Cambridge, he learnt at Padua his chosen science. Padua was then the first of schools of medicine. How many illustrious spirits—Petrarch, Galileo, Columbus—hover round her now desolate halls? Seats of learning, like imperial cities, have their periods of rise, maturity, and decay. So, also, our northern Athens, once preferred to all amongst our schools of medicine, now gives place to this metropolis; for, wherever industry and talent throng, there science loves to join them. Harvey's Cambridge training, or his Paduan studies, or his own bright perception, would have failed to raise him to his pinnacle of fame but for his amazing perseverance. Loving truth, and seeking her most ardently, yet his discoveries had to bear the test of factions opposition. Many a false discoverer has since presumed to claim him as their prototype, and attribute every

counter-argument to envy—the hanger-on of virtue. Miserable boasters! opposition is no evidence of truth. Mesmerists!—table prophets!—homoeopaths!—mountebanks!—Harvey's persecutions cannot change your fallacies to facts. The final triumph only shows where truth exists. Therefore Harvey triumphed finally, and lived to see his great discoveries acknowledged by his generation. Linacre closes the list of benefactors. He was the first person who taught Greek in Oxford; and he founded professorships in medicine at both universities. His influence obtained from Henry the Eighth, to whose elder brother he had been not only physician but preceptor, the royal charter by which this college governs. Till then, medicine had been studied in the cloister; and physicians, licensed by the Bishop of London and the Dean of St. Paul's, were united only as a society. Well have the laws framed by Linacre's suggestion worked out their object; witness the literature which has adorned the college, the science which it has improved; witness the men among its members—Sloane, Addington, Denman, and others, whose descendants are now numbered with the aristocracy of the land. Witness such men as Friend and Radcliffe, who to professional labours added their services in Parliament. Were their example followed, the task of legislating for the vast body of medical practitioners would not, as at this moment, be abandoned to members of the House, whose connexion with the profession does not entitle them to represent it, nor incline them to regard its general interests. Justice and expediency alike suggest that, of all the learned bodies of the kingdom, this should not remain the only one unrepresented. Have, then, these chartered privileges fostered so much excellence? Let us guard them well, and if changing times require that our laws be modified, let us seize, at least, the spirit of the ancient charter, and perpetuate in a new one what is good. To recur once more to Harvey. This college voted him a statue, yet no honours were bestowed on him by his country: shall we not regret this? It is in vain to say that such rewards are valueless. Titles are not mere decorations, but encouragements to others' virtue, and should be dealt with even hand. If the man whose office places him at the head of the physicians of this country—of the only profession whose members give a large portion of their labour freely to a needy public—were the man, I say, so distinguished to be decorated, would it not be a just and fitting compliment to the general body? I may not here declaim on living merit, yet there is one whom I would dare to single out—whose labours have enriched the stores of new discoveries, and who has won no less the public favour than his brethren's applause.—Bright, whose well-earned fame is echoed far beyond the shores of England. Let us greet with willing voice those fellows of our college on whom the Sovereign's favour has descended since we last met to celebrate this institution. To Holland—learned, accomplished, energetic—let us wish a lengthened period to enjoy his prosperous career; Burnett and Forbes have our congratulations. I would that public honours, showered freely on all other callings, were granted less unfrequently to ours: falling thickly on the legal robe, why do they so seldom rest on men who, in the academic grove, have walked in equal honour, and whose after course has added charity to learning? Let us, however, bear in mind, that whether some of our worthier members be neglected or rewarded, it is ours to raise our intellectual and moral standard for the sake of doing good—let us not forget that it is the office of this college, whose benefactors we have now extolled, to guide opinion throughout our profession. Let this college, in all reforms, listen to the general voice, and yield to varying circumstances; but let it so yield that it may not cede its special mission to open, yet to guard, the portal through which talents and learning are to enter, and for the public service be accredited.

After the oration a grand dinner took place, at which the President and Fellows of the College entertained a brilliant assemblage of visitors, amongst whom were, the American Minister; the Bishop of Oxford; the Earl of Yarborough; the Lord Justice Turner; the Right Hon. Spencer Walpole, M.P.; Mr. Baron Alderson; Mr. Justice Coleridge; Mr. Justice Cresswell; Mr. Justice Wightman; Sir John Hanmer, Bart., M.P.; Sir Benjamin Brodie, Bart.; Sir H. Ellis; the Master of Christ's College, Cambridge; Rev. H. Mackenzie; the President of the Royal College of Surgeons; the Director-General of the Army Medical Board; Mr. Travers; Mr. Stanley; Mr. Green; Mr. Cesar Hawkins; the Master of the Apothecaries' Society, &c. The usual toasts were given.

WE regret to learn that ill health, from over-physical and mental exertion, has for the present compelled Dr. O'Shaughnessy to abandon his electric undertaking in India.

Recognition of their undisputed privileges; but it is hoped and believed that, for the sake of uniformity and convenience, these learned bodies are prepared to resign their right of licensing for practice.

## MEDICAL REFORM.

## THE UNIVERSITY OF DURHAM.

(COPY.)

*To the Right Honourable Lord Viscount Palmerston, G.C.B.,  
Her Majesty's Secretary of State for the Home Department.*

*The Memorial of the undersigned Lecturers in the Medical  
Department of the Newcastle-on-Tyne College of Prac-  
tical Science, humbly sheweth,—*

That your Lordship's memorialists have had their attention directed to a Bill now before Parliament, by which it is proposed to grant certain privileges to the medical graduates of the University of Durham, which concessions, in the opinion of your memorialists, would operate to the general disadvantage of the medical profession in England, and be productive of considerable private injury to your memorialists.

That the only means of affording medical education possessed by the University of Durham, is a School or College in Newcastle, maintained by that University in opposition to your memorialists.

That attendance on the lectures delivered in that School is enforced, by the existing statutes of the University of Durham, as an essential preliminary to medical graduation in that institution; and that, as yet, there are no graduates in the University of Durham who have obtained a medical degree by examination.

That the conduct of the University of Durham, in recently attempting to create a new class of medical practitioners, with inferior qualifications, under the title of Licentiates in Medicine, and in announcing that those licentiates could practise on equal terms with the members of the Royal Colleges of Physicians and Surgeons, was a violation of the rights of those national medical institutions, which would probably be revived, were the Legislature to recognise the claims to a *quasi* independent medical jurisdiction now put forth by the University of Durham.

That the authorities of the University of Durham, taking advantage of a temporary difference amongst members of the medical profession resident in Newcastle, have endeavoured to obtain a degree of ascendancy over medical education, which your Lordship's memorialists believe to be incompatible with the honour and independence of their profession, and calculated to retard the advancement of medical science in the north of England.

That the interference of the University of Durham with the institutions of Newcastle has also been productive of considerable injury to the inhabitants of the latter town generally, by prolonging discord, by impeding the progress of industrial education amongst the working classes, and by forcing into a position of antagonism to an important church institution many who, like your memorialists, are members of the Church of England, and warmly attached to its principles.

Under these circumstances, your memorialists humbly hope that your Lordship will be pleased to oppose the Bill now before Parliament, and adopt such further measures as may appear to your Lordship necessary for the protection of the interests of the medical profession, and for the general welfare of the community in this district.

Whitehall, June 14, 1854.

SIR,—I am directed by Viscount Palmerston to acknowledge the receipt of your letter of the 9th inst., inclosing a Memorial from the Lecturers in the Medical Department of the Newcastle College of Practical Science.

I am, Sir, your obedient servant,

Sir John Fife, Newcastle-on-Tyne.

H. WADDINGTON.

PARIS UNIVERSAL EXHIBITION OF 1855.—A meeting of the surgical instrument-makers and cutlers of the metropolis was held on the 30th ult., at Marlborough-house, at the invitation of the Board of Trade, to advise the officers of the department of Science and Art in making the preliminary arrangements for the Paris Exhibition.

## DR. CORMACK'S VOTE AT THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

The following correspondence has taken place with respect to Dr. Cormack's vote:—

[NOTE FROM DR. DRUITT.]

To the Editor of THE LANCET.

SIR,—A paragraph appeared in THE LANCET of June 24, respecting a vote alleged to have been given by Dr. Cormack at a certain meeting of the Royal Medico-Chirurgical Society. In that paragraph my name was introduced, and thus I am made to appear as a witness in the case. May I appeal to your courtesy to allow me to state that the paragraph in question was inserted without my knowledge or consent, and that I have not the faintest recollection of any circumstance relating to the vote which Dr. Cormack did or did not give? and further, that I have no doubt whatever of Dr. Cormack's veracity.

I am, Sir, your obedient servant,

Curzon-street, July 1, 1854.

ROBERT DRUITT.

[THE SUB-EDITOR OF "THE LANCET" TO DR. DRUITT.]

SIR,—I am directed by the Editor of THE LANCET to inform you that your note, dated July 1, shall appear in the journal of this week. As Dr. Tanner distinctly asserts that the conversation to which your note refers took place, the Editor would be glad to know whether your communication is intended to convey a contradiction of that statement.

[DR. DRUITT'S REPLY.]

SIR,—I have no distinct recollection of the conversation stated to have taken place between Dr. Tanner and myself; yet, having implicit confidence in Dr. Tanner's honour, I believe that it did take place, though I have forgotten it.

The sole object of my note of the 1st was to avoid being dragged in as a sort of witness in a case where the truthfulness of a gentleman was disputed. I did not see Dr. Cormack vote, neither did I see him do the contrary. I know nothing of the facts. I am not a witness, and anything said by Dr. Tanner to me then or at any other time does not make me one.

In this as in other cases, where great excitement has been created, I believe the memory of the most conscientious man may err as to a matter of fact. I infinitely prefer this way of explaining the discrepancy, and would not accuse either Dr. Cormack or Dr. O'Connor of wilful falsehood. At all events, I beg that my name may not be dragged into any controversy in which the veracity of a gentleman is disputed.

In order to do justice to both parties, perhaps you will be good enough to state that, in washing my own hands of the matter, I no more desire to be understood as implicating Dr. O'Connor than Dr. Cormack.

I am, Sir, with thanks for your courtesy,

Your obedient servant,

39 A, Curzon-street, July 4, 1854.

R. DRUITT.

[THE SUB-EDITOR OF "THE LANCET" TO DR. TANNER.]

THE LANCET Office, July 3, 1854.

SIR,—The Editor of THE LANCET has requested me to beg your attention to a Notice to Correspondents contained in that journal of June 24, in which your name appears. He would feel obliged if you would inform him whether the statement there made be strictly correct, so far as concerns yourself.

I am, Sir, your obedient servant,

Dr. Tanner.

THE SUB-EDITOR OF "THE LANCET."

[DR. TANNER'S REPLY.]

July 3, 1854.

SIR,—In reply to your inquiry, I beg to say that the statement contained in the Notice to Correspondents, in THE LANCET, June 24, is strictly correct as far as regards myself.

I am, Sir, your obedient servant,

The Sub-Editor of THE LANCET.

T. H. TANNER.

APPOINTMENTS.—At a general meeting of the governors, held on Wednesday, the 5th ult., Dr. J. C. Hall, Dr. J. Law, and Dr. C. Elam, were unanimously elected physicians to the Sheffield Public Dispensary.

## Correspondence.

*"Audi alteram partem."*

## GRIEVANCES OF UNION SURGEONS.

*To the Editor of THE LANCET.*

SIR,—In THE LANCET of June 24, I noticed a letter from "Scrutator," in which I regret to find that he has designated the efforts which have already been made by union surgeons to gain better remuneration for their arduous duties, as "much to-do about nothing." To this off-hand view of the matter I cannot consent; for I firmly believe that the frequent *exposés* which have been made, and the no less frequent applications to the Poor-law Board, have rendered the cause of union surgeons an essential service, and have led indirectly to the institution of the present Parliamentary inquiry. What will be the result of that inquiry no man can tell; though I cannot divest my mind of the idea that it will end in a recommendation to the House of Commons for a considerable amelioration of the present condition of union surgeons. It is not my intention to give you any more "dispensing statistics" at present, as those already issued I have reason to know have answered a good purpose, nor do I wish to trouble you with a "croaking letter." But such as it is, pray accept it.

From boards of guardians and from the Poor-law Board, I know, from ample experience, that union surgeons have nothing to expect, and it has certainly proved to be "much to-do about nothing" in attempting to gain justice from either of these bodies. Over and over again during my term of office, (now upwards of seven years,) I have endeavoured to obtain a modicum of justice from the board of guardians, but invariably without success; my application being generally responded to by a hasty resolution, "that the subject be deferred to that day six months." But has this deterred me from prosecuting my purpose? No. I have striven even with more vigour after every defeat, and if I am spared a little longer, I still hope to see the day when union surgeons will not be considered as the dogs of the profession, and fair game for unworthy treatment, but as honourable men performing a dangerous, a painful, and a properly-required duty.

I have appealed also repeatedly to the Poor-law Board, and have received a polite official reply on several occasions, that my case should be considered, but "hope deferred maketh the heart sick," and, hitherto, my expectations from that source have been woefully disappointed. I find the Poor-law Board do not consider themselves a court of appeal, and, as a rule, experience ratifies that they will only sanction what the boards of guardians recommend. So that, between the two, union surgeons fall to the ground, and have no chance of obtaining redress.

In August, 1853, I received my last communication from the Poor-law Board, in which the following sentence occurs:—"The Board direct me to state, that had the guardians thought it right to make any recommendation to them on the subject of your salary, they would have given that recommendation their consideration, but that, looking to the amount of the salaries paid to the other medical officers, and to the extent and population of their respective districts, the Board do not think that your case is of such an exceptional character as to require their interference in opposition to the views of the guardians."

This is all that can be obtained from the Poor-law Board. Is it not clear that these two bodies play into the hands of one another? And is it not equally clear that between two stools the medical officer is permitted to fall? Whether it be creditable or not, I leave others to judge. If, therefore, it be admitted by the Poor-law Board itself, that my case is not one of "an exceptional character," the medical officers under the Poor-law must, as a body, be in a lamentable condition; but I sincerely hope the pending Parliamentary inquiry will redound to the honour of our legislators, and secure justice for a body of gentlemen without whose services the Poor-law would be little better than a blank.

"Scrutator" says, "resign in a body." This is prompt advice, but would such a course do any good? Strikes seldom ever accomplish the purpose for which they are undertaken. If it could be guaranteed, however, that the entire profession would stand aloof in case of a general resignation by union surgeons, then the point at issue might, perhaps, be gained; but I do not think this devotion to our cause can possibly be expected. Unanimity could not be gained. The strike would prove a lamentable failure. The better course I think is, to elicit the *sympathies* of the entire profession, be they high in

place or humble in circumstance, to implore them, most respectfully yet energetically, to aid our cause by addressing letters of explanation and remonstrance to some member of the "Select Committee," or to the representative in Parliament of the county, borough, or town in which the writer resides. This would be but a small outlay of time in so good a cause, and the combined movement would carry great weight. It is at all times difficult for medical men to meet together, but a letter can be written at leisure.

Let me hope that our professional brethren will accede to this request, and step in to our succour *without a moment's delay*, or the vantage ground will be lost. Let not another sun set without their rendering this graceful service, and they will thus ensure the gratitude of a large body of fellow practitioners, whose only fault is that they do too much work for too little pay.

I am, Sir, your obedient servant,  
Cheapside, Halifax, June, 1854. FREDERICK SMITH GARLICK,

## THE "VALUE" OF THE ASSOCIATION JOURNAL.

*To the Editor of THE LANCET.*

SIR,—The present position of the Provincial Medical and Surgical Association is an anomalous one. Having a word or two to say upon it, I prefer addressing myself to you, rather than to incur a polite note from the Editor of the *Association Journal*, informing me that, on consideration, I should agree with him that the publication of my communication in the *Journal* would not be conducive to the interests of that extraordinary piece of imbecility.

At the Oxford meeting the long-existing dissatisfaction with the old *Journal* was brought to a crisis by the energetic declamation of Dr. Cowan. We were promised everything that could be desired in the shape of a weekly journal, and the only special pleading required was in reference to the increase of expenditure which the projected change would entail. Still, so far were the majority from being convinced of the desirableness of the step, that it was only by dint of admirable management, to the extent of obfuscating the ideas of many (both ruling and ruled) as to what they were voting for, that a mere majority was obtained. I voted for the change, and I did so in the confident expectation that we should obtain a weekly periodical of the highest character, which would contain a succinct epitome of all British and foreign notable medical matters at the very time of their appearance, a full account of the proceedings at the Medical Societies, a brief digest of medical news, accurate notices of new books, and an earnest exposure of quackery, whether in or out of the profession, in books or in actions, and all this done in the best style. I did not anticipate that much space would be occupied by editorial platitudes on things in general, good-boyish moralities, heavy lumbering scraps of self-gratulation for things done, which had been merely by chance alluded to in some forgotten previous number, coupled with threats of future boredom on all imaginable text-book subjects, winding up at the end of the year with an index of the grand results which had flown from the exertions editorial! I, for one, expected that the duties of the future Editor would consist rather in the industry with which he would cull good materials from the very prolific soil at his disposal, and in the cautious supervision he would exercise over the epistolary twaddle department, than in flourishing his pen in the so-styled leading articles, of which, if our own be typical specimens, Heaven preserve me from ever becoming a writer! We were to pay enough for it. Indeed, but for this, we do not really require a journal of our own at all. The argument, that we need one for the publication of Association business, is untenable. That would find insertion quite as readily, and perhaps with less prejudice, elsewhere, if we possessed no *Journal*. The real reason for having the *Journal*, and for having it published once a week, was merely that of tempting new members to join, by holding out the bait of a cheaper mode of keeping *as courant* with the times than any other journal affords. I do not impugn the excellence of such a reason. I think it a very proper and forcible, as I know it to be the influential, one; but I do impugn the mode in which the promise, whether assumed or expressed, is fulfilled. Good type and good paper we have; but I assert that the *Association Journal* is not nearly what we have a right to expect it to be, it is the poorest by far of all the medical journals, with one exception. The addition to the number of members, of which so much has been said, is due, not to what the *Journal* is, but to what was expected from it.

In its own special line, it ought to be an unsurpassable journal—a periodical of which each member might feel proud.

What is it to the greater body of members whether Dr. Cormack may have a personal "tiff" with A or B?—whether he blunders into a scrape or blunders out of it? What to them are the mere personal jealousies and bickerings of any of the members of the Metropolitan Branch? Indeed, what greater interest have they in the thoughts and wishes of these members than in the thoughts and wishes of any equal number of provincial members? It is looming not very far or very dimly in the distance, that the Association will become a London society, with members in the country; with the metropolitan segment—branch no longer—as the central governing body, in place of "Our good Mother at Worcester," (who, I must say, was always, if womanish at all, which I doubt, at least a lady in her intercourse with her progeny;) with the *Journal* as the particular organ of the most active and pushing members of the London Board on the "Caw me and I'll caw thee" principle. The narrow end of the wedge is in; it remains with the members at large whether or not they will permit it to be driven home.

Why should the *Journal* be of such a calibre that no one even yet ever thinks of preserving its numbers, unless for the sake of the odd page of meteorological statistics? Why should space be occupied by "leading articles" when there is nothing to be said. Why, indeed!

"The reason why I cannot tell;  
But this alone I know full well"—  
And of my letter 'tis the kernel:  
We're sold ourselves, but not our *Journal*.

I remain, Sir, your obedient servant,

AN ANTIQUATED MEMBER OF THE ASSOCIATION.

July, 1854.

## COUNTY COURT, ETRURIA, STAFFORDSHIRE.

### CONVICTION FOR PRACTISING AS AN APOTHECARY.

#### THE APOTHECARIES' COMPANY *V.* DIXON.

In this action, which was brought by the Apothecaries' Company, London, the defendant, Mr. James Dixon, is a chemist and druggist, carrying on business in Hanley, the action being to recover from him the penalty of £20 for practising as an apothecary without the requisite certificates of qualification and competency. The case excited a great deal of interest, and during the proceedings the court was crowded with persons, amongst whom were several of the resident medical gentlemen. Mr. Kenealy, barrister, instructed by Mr. Heaton, appeared for the plaintiffs, and Mr. C. B. Passman, of Stafford, for the defendant.

Mr. Kenealy, in opening the case, stated that the suit had been brought under the 55th George III., chap. 104, sec. 20, which regulated the practice of apothecaries in this country; and some time ago, in consequence of an influx of persons not qualified as medical practitioners into the district, several of the members of the profession united in forming a society for the purpose of protecting themselves, and of endeavouring to restrain the persons alluded to from practising. Amongst others whose names were forwarded to them was that of Mr. Dixon, and in order not to take any proceedings against him, without previously intimating to him their determination of doing so, unless he desisted in his course of conduct, a communication to that effect was addressed to him through Mr. Heaton, but without any effect; and on the matter being afterwards represented to the Apothecaries' Company, a second letter, with a similar purport, was sent to him, notwithstanding which, however, he continued to practise as before, and the present proceedings had accordingly been taken. Having also stated that he should submit three cases to his Honour, clearly implicating the defendant in such transactions, Mr. Kenealy went on to call his witnesses.

The first of these was Ann Sutton, a married woman residing in Hanley, who deposed that in August last a daughter of hers, about six months old, became unwell, and she took it to the defendant's shop, and the defendant, after examining it, said it was ill, and gave her a bottle of medicine, with directions how to administer it, for which she paid him. She took the infant to him a second time, when he again examined it, and said it was suffering from inflammation of the bowels, and he gave her some more medicine. He saw the child several times afterwards at his shop, and made on each occasion inquiries as to how it was going on, &c. On the 2nd of September, the child got worse, and she then fetched the defendant to see it. He came, and on examining it, he said it could not last long, but gave some directions how to treat it. It died on the following day. She paid him for the medicine each time she

received it, but he did not charge for anything else. She afterwards went to the defendant for a certificate of the cause of death, and received a document, which she took to Mr. J. B. Davies, the registrar.

Mr. Davies (who is also a surgeon at Hanley) was then examined, and stated that he received the document produced (which was afterwards read in court, and proved to be a medical certificate of the death and cause of death of the child, signed by the defendant as a surgeon) from the person who came to register the death, and he had no doubt it was from the last witness.

Mr. Moxon, solicitor, having deposed to the defendant's handwriting, the first case was closed by the certificate being put in and read by the clerk.

The next witness was Ellen Jackson, who deposed to her infant daughter being unwell in October last, when she took it to the defendant, who examined her, and pronounced her to be dangerously ill, and suffering from measles and incipient fever. He said she must not be brought out of doors again, and then gave her a bottle of medicine and two powders, with the usual directions as to the doses, &c. Next day she sent for him, as there was something wrong with the child's mouth and teeth, and he afterwards sent her a preparation to wash its mouth out with; and he called several times to see it, and sent medicine for it, before it died. After it died she got a paper from the defendant, which she took to Mr. Davies, but she could not say whether the one produced was the same. She paid the defendant for the medicine, and asked him what he would charge for his attendance. He said he would send her the bill, but he had not done so since, nor had he mentioned the matter when she saw him.

The cross-examination by Mr. Passman was principally directed to show that the defendant, who was a surgeon-dentist, had seen the child on account of its mouth and teeth. The examination of Mr. Davies was to a similar effect to that in the preceding case.

Prudence Bell, a married woman, residing at Etruria, was the next witness called. She deposed, that being taken unwell soon after Chester races last year, her husband fetched the defendant to attend her at her own house. He accordingly came, and having felt her pulse and asked her different questions, he said she had got the bowel complaint, and he would send her some medicine which would do her good. She received a bottle of medicine accordingly, and took it. He saw her twice afterwards, and sent her some more medicine and some pills; but as she did not improve, but got worse, her husband fetched Mr. Garner, surgeon, of Stoke, to attend her, and gave notice to the defendant that his services would be no longer required. He sent in his bill immediately, and it was taken away by Mr. Garner. On cross-examination, she said that the bill was not paid, and that she subsequently received a letter from the defendant, accompanied by his bill for medicine and attendance, threatening legal measures if it were not paid. She believed the handwriting in the letter and the bill was the defendant's. She had seen him write once, but did not take particular notice. The first bill was brought to her house by the defendant's boy.

The bill and the letter having been put in, Mr. Kenealy intimated that his case was closed.

Mr. Passman then objected that, under the 30th section of the Act, twenty-one days' notice of action ought to have been given to the defendant; secondly, that it was requisite under the Act that cases charged against the defendant should have occurred within six months previously to the action being brought, which was not so with regard to those which had been adduced before the court; and thirdly, that the plaintiffs must prove their retainer from the Apothecaries' Company, which latter point he argued at some length.

Mr. Kenealy having briefly replied, his Honour observed that with regard to these objections, he did not think any of them were applicable to that kind of action. The two former—namely, the twenty-one days' notice and the limit of six months, had reference to matters done by the Apothecaries' Company in pursuance of the Act of Parliament, which conferred upon them certain powers, but at the same time left them exposed to action if those powers were exercised wrongly or to the injury of any persons, in which cases those persons before taking legal proceedings must give the Company twenty-one days' notice of doing so, and not allow six months to elapse between the fact complained of and the action. In the case before the court, however, it was very different, as the facts alleged had not been committed in pursuance of the Act of Parliament, but in contravention of it, and the objections, therefore, did not apply. With regard to the production of the retainer, his Honour admitted that, in certain cases, the

production of the retainer, under seal also, was necessary, but held that the present action was by no means one of that character.

Mr. Passman then proceeded to address the court on the merits of the case, contending, in the course of his remarks, that, according to the evidence, the defendant had done no more than a chemist and druggist might do under the Act of Parliament. With regard to the bill produced in the last case, he maintained that no reliable proof of its having been sent by the defendant had been established, and having read one or two reported cases, which he affirmed were analogous, in support of his arguments, Mr. Passman concluded by expressing his belief that this action had arisen from a jealous feeling on the part of the profession, and by defying any imputation upon the talents and abilities of the defendant.

His Honour afterwards summed up in a most lucid and impartial manner. Setting aside the consideration as to whether the defendant had been useful in practising as he had done, or whether he had been the contrary, as being matters which could not influence his judgment, he confined himself to the simple question,—had the defendant, according to the evidence, illegally acted as an apothecary? If he had, he had no discretion but to award the whole amount of the penalty, whether he might consider it hard upon the defendant or not. Looking next at the evidence, and particularly that of the witness Bell, and coupling it with the fact of the defendant having described himself as a surgeon in the certificates sent to the registrar, and also with that of his having charged in the bill sent to Mrs. Bell for "attendance and prescriptions," he thought it was impossible for the defendant to escape, and he had no alternative therefore but to declare a verdict for the amount claimed.

Some conversation then ensued as to how it should be paid, and it was agreed that the defendant's offer of £5 forthwith, and the remainder in two months, should be accepted.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted Members of the College at a meeting of the Court of Examiners on the 30th ult.:

BERESFORD, CHARLES, Congleton, Cheshire.  
DAY, ALBERT BRYAN, Isleworth.  
ENGLAND, WILLIAM HENRY, Leeds.  
GODFREY, JOSEPH JOHN, Turvey, Beds.  
HARGOOD, FREDERICK HEZEKIAH, Army.  
HAYARD, JOHN EVANS, Blangothan, Llangollen.  
MORRIS, JOHN PENFOLD, Lewes, Sussex.  
PORTER, HENRY, Peterborough.  
QUINTON, CHARLES, Wolverhampton.  
REID, DOUGLAS ARTHUR, Southsea, Hants.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, June 29th, 1854.

CARTER, ROWLAND WIMBURN, Army.  
MORGAN, SAMUEL, Warminster, Wilts.  
WILLY, THOMAS VALENTINE STAPLE, Somerset.

**BOARD OF TRADE, WHITEHALL, JUNE 28.**—The Right Hon. the Lords of the Committee of Privy Council for Trade and Plantations have received, through the Secretary of State for the Colonies, a copy of a despatch from the Governor of Gibraltar, reporting the raising of the temporary quarantine imposed by him in February last. The Right Hon. the Lords of the Committee of Privy Council for Trade and Plantations have received, through the Secretary of State for Foreign Affairs, a copy of a despatch from her Majesty's Consul at Lisbon, enclosing a notice of the Portuguese Board of Health, declaring that all the ports of England are considered clean from the 6th of June; but that the port of Limerick continues to be treated as infected, and all other ports of Ireland as suspected of infection with Asiatic cholera.—From the *London Gazette* of Friday, June 30.

**NAVAL APPOINTMENTS.**—Acting assistant-surgeons G. T. Keels (1854), to the *Calcutta*, 84, at Devonport; John A. Young (1854), to the *Colossus*, 80, screw steam-ship, for service with the Baltic fleet.

**WHITECHAPEL COUNTY COURT (JUNE 29).**—*Before Mr. Serjeant MANNING.*—**THE POTBOY TURNED DOCTOR: RONDEAN v. LANGTON.**—This action, brought to recover the small sum of sixteen shillings, disclosed the credulity of the denizens of the metropolitan eastern suburbs in patronizing empiricism; indeed, the proceedings at the Whitechapel County Court too frequently exhibit cases in which quacks figure in a light almost incredible. The Apothecaries' Company, some short time since, obtained a conviction, by a penalty of £20, against one of these East-end gentry, at this County Court, and they would do well to pay the like compliment to Mr. Langton, the defendant in this action. Mr. Steadman, solicitor to the plaintiff, stated that the action was to recover eleven shillings, monies paid to a loan society in which defendant was a defaulter, and the plaintiff, who kept the "Earl Grey," Bethnal-green-road, was the security. The other five shillings was for balance of money lent to buy the defendant a watch-guard, so that he could come "the swell" at public-house concert-rooms, where he was formerly a "star." The case had been adjourned for the production of the secretary of the loan society, who was present, to prove lending the defendant money which the plaintiff had to pay. The court no doubt felt surprised to find the defendant described as a surgeon, and he (Mr. Steadman) was astounded to find that he practised in a very extensive way as a chemist, surgeon, acconcheur, and physician, in Church-street, St. George's-in-the-East, (so the reporter understood the solicitor to describe defendant's residence;) when the fact was, this celebrated doctor was nothing else but a clever potman at public-houses. (Roars of laughter.) It seemed incredible that such a state of things could be, but so it was; and this potman-doctor, he was assured, did a more lucrative business than the qualified men in his neighbourhood. He was a most impudent quack, and he did not believe he could read a prescription.—The defendant here, in a subdued and imploring tone, interrupted the learned gentleman with "Oh, pray don't say so! What has it to do with the case whether I am a potman or a surgeon?" (Roars of laughter.)—Mr. Steadman, with some warmth: It shows you are an impudent quack; and I think it high time you looked after your pots, instead of ignorant patients. (Much laughter.)—Mr. Langton's defence was, that he borrowed the money of the loan society five different times for the plaintiff's use, who was virtually security for himself. He admitted that he had deceived the loan societies, but modestly refrained from noticing the soft impeachment of pots and physic.—The learned judge, who appeared astounded at the revelation, with some warmth said, by the defendant's own showing he had committed five frauds, and as plaintiff denied his having the money for himself, he could not consider the defendant entitled to credit, and gave a verdict, with costs, for the plaintiff. The potman-doctor then strutted out of court to attend his patients.

**MILITARY APPOINTMENTS.**—12th Regiment of Light Dragoons: Assist.-surg. Gavin Ainalie Turnbull, from the 95th Foot, to be assist.-surg., vice Flood, deceased.—3rd Regiment of Foot: Thomas Teevan, gent., to be assist.-surg., vice Clayton, removed from the service.—66th Foot: Assist.-surg. Wm. Sim Murray, M.B., from the Staff, to be assist.-surg., vice Simpson, promoted in the 17th Foot.—76th Foot: Assist.-surg. Duncan Alexander Campbell Fraser, M.D., from the staff, to be assist.-surg., vice Gordon, appointed to the staff.

**SMALL-POX IN SCOTLAND.**—We do not remember any disease having been at any time so general here as the small-pox has been for the last six or eight weeks. It has attacked every second or third family, both in the village and neighbourhood. One case only has proved fatal.

## Obituary.

ON the 27th May, at Spanish Town, Jamaica, Dr. BROOKS, of cholera. During the day preceding his death deceased was seized with premonitory symptoms. At five o'clock, he attended his last patient, who suffered from cholera. But after that he could no longer contend against the disease. Dr. Brooks went home and went to bed. The following day he died, at two o'clock, leaving only one medical man to attend the sick. Of seventy-eight cases fifteen proved fatal, exclusive of which there were ninety-six cases with premonitory symptoms.

On the 10th of May, at Mount Moreland, near Spanish Town, Jamaica, of cholera, EDWARD CHARLES BUNNETT, the

youngest son of HENRY JAMES BURNETT, Esq., M.D., aged thirty-five.  
On the 20th ult., at Market Lavington, Wiltshire, JAMES HERRIOT, Esq., M.R.C.S.E., L.A.C., Medical Officer Devises Union.

### BOOKS RECEIVED FOR REVIEW.

### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under..... 20 4 6 | For half a page ..... £2 12 0  
For every additional line .. 0 0 6 | For a page ..... 5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year .. .. .	£1 14 8
Six Months .. .. .	0 17 4
Three Months .. .. .	0 9 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 420, Strand, London, and made payable to him at the Strand Post Office.

### TO CORRESPONDENTS.

*Pater Familias, A Visitor, and others*.—We cannot insert any more communications respecting Dr. Kahn's museum. From the note of Dr. Kahn, which appeared in our last, it will be seen that the controversy relative to the admission of females has elicited a promise from him to entirely exclude ladies from the syphilitic-room, also to remove any objectionable models in the exhibition that might be pointed out to him. We think this must be satisfactory to our correspondents. It is a pity that a valuable museum, which might be made the means of advancing the studies and researches of the junior members of the profession, should be damaged by specimens degrading to the mind of the student or visitor. Since the appearance of Dr. Kahn's letter, we have visited the collection, and pointed out several models that ought to be removed. Dr. Kahn very promptly acquiesced in our recommendation—and, farther, said that he would willingly take away any specimen that medical gentlemen might consider unfit to be inspected by ladies. We hope now that the complaints respecting this really, in many respects, interesting museum will cease.

*One Present, &c.*—The disgraceful conduct mentioned has not passed unnoticed. The most culpable of the parties are the reporters of the *Times* and the *Morning Advertiser*, and the editors of those journals will have formal complaints of the misconduct laid before them. Nearly the whole of the press has acted unfairly in publishing portions of the proceedings before the inquiry has terminated. Grave accusations have been made, and the answers not heard; and down to the hour when we are writing (Thursday morning) not a single witness has been called by the parties whose conduct has been impugned. The comments in the *Observer* have been highly libellous, and must lead to a judicial inquiry. Had not Mr. Wakley, jun., been the son of a gentleman who for many years has been connected with the medical press, he would not have been exposed to the malignant conspiracies which are directed against his reputation. If the conductors of the press generally are content to see the professional members of their families attacked and crushed by the all-powerful engine they control, it is well that such a fact should be known. Neither in generosity, in dignity, nor in self-respect, is it very likely that the character of the press can obtain any advantage by such a course of policy. It certainly is an undoubted fact that Mr. Wakley, junior, has been malignantly assailed as an hospital surgeon, because he happens to be the son of the Editor of a public journal.

*Assistant-Surgeon*.—No mention is made in the "Regulations" issued by the Admiralty of any such examination.

*Vaccination Amendment Act*.—The various gentlemen who have addressed us respecting the amended Act will perceive that the subject is treated of in a leading article.

*Mr. John E. Milton*.—It would be altogether inconsistent with the objects of a medical journal to enter upon a philological discussion. The views of our correspondent, although not agreeing with our own, we readily admit to have their weight. But setting aside all questions of etymology, we consider that the genius of the English language is to make words imported from foreign sources conform to English rules of pronunciation. On this ground alone the "c" before "a," "i," and "y," representing "æ," must have a soft sound. We regret that we cannot insert Mr. Milton's very ingenious communication.

*Dr. Crisp's* communication shall be noticed next week.

*M.R.C.S. and L.S.A.*—The appointments are not annual; but are subject to the control of the magistrates in the one instance, and the Commissioners of Police in the other. It is not necessary for the holder to possess the double qualification.

*Chirurgus*, (Bristol).—Can it be possible that the bill, headed "W. E. Johnson," is circulated by a member of the profession? It is certainly a curiosity, and as such should be preserved:—

"W. E. Johnson, Surgeon-Accoucheur, and Surgeon-Accoucheur to the Dorcas Society, for the District of St. Mary Redcliff, Thomas and Temple parishes, returns his sincere thanks to his numerous friends and the public in general for the very liberal patronage bestowed on him for the last three years, since taking to the above business; and pledges himself to them, that his punctuality and perseverance in his professional duties shall continue the same, feeling assured from long experience that it will gain for him that confidence which he merits, having been in one of the first hospitals in Paris for many years, where he gained for himself that confidence and experience which enables him to carry out his profession in a more scientific manner than is generally practised by many of our English medical practitioners.

"W. E. J. still continues, as usual, to attend the working class, at their own residences, on payment of three shillings per week, including medicine; and if they attend the surgery, they may obtain the same on payment of two shillings per week; accouchements, fifteen shillings; with chloroform, one guinea.

"Any poor person may be attended, with a recommendation from a respectable housekeeper, on payment of seven shillings and sixpence.

"Advice gratis from nine to ten in the morning, and from six to eight in the evening.

"Cathay, June 23rd, 1854."

*Mr. Hamilton*, (H.M.S. Odin, Baltic fleet).—Our correspondent's request shall receive attention.

A CORRESPONDENT, who has sent us a report respecting the Norfolk and Norwich Hospital, has forgotten to authenticate it.

A. B., (Hull).—The paragraph referring to Mr. Wilkinson, of Barton, in the *Hall Advertiser*, though somewhat irregular, was probably inserted by some injudicious friend of that gentleman.

*Clinique*.—The "medical reports" would be acceptable if practical and sufficiently condensed. We cannot give a positive promise that they shall appear until we have had an opportunity of perusing them. The first had better be sent to the Office. We shall be glad to receive it.

A *Constant Reader*, (London).—Supposing a degree could be obtained in the way hinted by our correspondent, it would be a disgrace rather than an honour to the party holding it. We believe that personal attendance is requisite now at most of the universities in Germany.

One who feels that he has been victimised.—1. The disease is easily cured.—2. Apply to a respectable surgeon. Avoid the advertising quacks, unless you wish your pockets emptied, and your health destroyed.—3. Cannot say the amount.

*Mr. Elridge*.—Mr. Milton's papers were published in the last volume of *THE LANCET*. We must decline according to our correspondent's last request.

A *Country Surgeon*.—If the case be considered incurable, it is probable he would not be admitted into any of the London hospitals. The Westminster Hospital admits a limited number of incurable patients, but there is much difficulty in obtaining admission.

*Nemo*.—There is no parallel between the two cases. The *Association Journal* is the property of a body of gentlemen, and not a trade speculation. That which would be derogatory to the Provincial Medical Association might be regarded as honourable in tradesmen. There is much truth in what our correspondent says respecting the proprietor of the other journal named; but we feel assured that on reflection he will see the impropriety of our publishing his letter.

*Veritas*.—There is a regular fixed scale of fees for medical witnesses in criminal cases. The fee is £1 1s. per diem, with the allowance of reasonable expenses for passage to the place in which the trial is held.

A *Member of the Provincial Association, &c.*, is thanked for his communication. He will perceive that his request has been complied with. Our only object in requesting permission to attach his name to the letter he has forwarded to us for publication, was a conviction that such a remonstrance from such a quarter could not fail to exert a most beneficial influence upon the Association of which he is so worthy a member.

*Dr. Schulz*.—Next week.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Dr. Robert Dundas Thomson; Dr. Tanner; Mr. Milton; Assistant-Surgeon; Chirurgus; Mr. T. Hutchinson, (Cambridge); Dr. Mansell, (St. Andrew's, with enclosure); Dr. Crauford, (Peebles, with enclosure); A. B., (with enclosure); Mr. W. Garstang, (with enclosure); Clinique; Mr. Wadsworth, (Leeds, Yorkshire); A Constant Reader, (London); T. B.; Dr. James Jago; M.R.C.S. and L.S.A.; One who feels that he has been victimised; Mr. Furness Shaw, (Calcutta Medical College); Mr. Furness, (Newcastle-upon-Tyne); A Subscriber, (Birmingham); Dr. Benjamin Ridge, (Putney); Mr. Robert Pollock; Mr. C. Neate, (Uttoxeter); A Country Surgeon; Dr. Maurice Schulz; Mr. Hamilton, (H.M.S. Odin, Baltic fleet); Mr. John Smith, (Sheerness); Dr. Crisp; Pater Familias; A Visitor; One Present; Mr. Elridge; Nemo; Veritas; A Member of the Provincial Association; &c. &c.

**Hooper's Invalid Water Cushions and Mattresses, or Beds, for Bed-sores,**  
 whether threatened with Sloughing, or in which Sloughing has actually taken place.—Fractures, Diseased Joints, Ulcerated Cartilages, Paralysis, Spinal Affections, Renal Diseases, Inflammation of the Bowels, Spasms, Lassitude, Typhoid and other Fevers, Gout and Rheumatic Affections, Cancer, Ovarian Dropsy, Coldness of the Stomach and Feet, Consumptive, and all Bed-ridden Patients. Mr. Hooper has succeeded in obtaining Waterproof Sheetings (Bed Protectors) at a Great Reduction in Price, Free from Smell, and not affected by Temperature, Urine, Acids, or Alkalies; and, MAY BE WASHED AS FAMILY LINEN. Also—

**IMPROVED. URINALS, AND ELASTIC BED PANS, OR RECEPTACLES,**

INDIA-RUBBER, KENNA, and DOUCHE, answering equally for either purpose, and may be carried in the Pocket.

For Hospitals and other Institutions a Discount is allowed. Their advantages over the costly and cumbersome Water Beds have been published in the Medical Journals, and they are particularly applicable for Paralytic and Lumatic Patients.

"I HAVE in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water-Bed."

"JONAS PEREIRA, M.D.,  
 "Physician to the London Hospital,  
 "Finsbury-square,  
 "February 22, 1853."

"North Wales Lunatic Asylum.

"SIR,—  
 "Your Water Cushions and Mattresses answer most admirably; indeed, they are invaluable. They have been in use here for eighteen months."  
 "Jan. 1854."

"B. L. WILLIAMS, M.D., Visit. Phys."

INVALID CUSHION,  
 FOR GENERAL PURPOSES.

## The Cholera Prevented by the

destruction of all noxious effluvia.

**CREWS'S DISINFECTING FLUID.** Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC. Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London. Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Sir William Burnett's Patents.—In

the year 1833, Patents were granted to Sir William Burnett, M.D., F.R.S., Director-General of the Medical Department of the Royal Navy, for the use of Chloride of Zinc, as applied to the preservation of Timber, Canvas, Cordage, Cotton, Woollen, and other articles from Rot, Mildew, Moth, &c.; and in 1852 Her Majesty was pleased to grant an extension for 7 years. Parties using Chloride of Zinc for any such purposes must purchase the same from the Proprietors of the Patents, at their Office, No. 18, Cannon-street, London-bridge; and any person using it without license will be proceeded against for infringement of their Patents.

N.B.—The Prize Medal of 1851 was awarded by the Royal Commissioners for Sir William Burnett's Patent.

## Sir William Burnett's Disinfecting

**FLUID.**—The great and invariable success of Sir William Burnett's Patent Solution, in preserving Timber, &c. from Rot, and in arresting the Decomposition of Animal and Vegetable Matters, soon led to its general application as an Antiseptic or Disinfecting Agent; and for the last eight years it has been in general use, with a success and public benefit truly marvellous, for the Disinfection of Sick Rooms, Clothing, Linen, &c.; the Prevention of Contagion; the Purification of Bilge-water and Ships' holds, Cesspools, Drains, Water-closets, Stables, Dog-kennels, &c.

It is now only necessary to caution the public against an imitation which, for the last month or two, has been advertised as an "IMPROVED CHLORIDE OF ZINC," and even recommended by selections from Sir William Burnett's own Testimonials.

Sir William Burnett's Disinfecting Fluid is sold by all Chemists and Druggists, and at No. 18, Cannon-street, London-bridge.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED. FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in Imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London. Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.  
Insipissated Juice. Dose, half a drachm to a drachm; 16s. per lb.  
Solid Extract. Dose, five to fifteen grains; 20s. per lb.  
Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipissation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## JOZEAU'S COPAHINE MÈGE.

Or SACCHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 9d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

## Major's Remedies for the Horse,

the best and most effectual ever discovered, superseding the "burning iron" and the torture of the "cautery."

MAJOR'S BRITISH REMEDY, for the cure of ringbone, spavins, splints &c. A single bottle sufficient to cure from four to six spavins, £1 15s.

MAJOR'S SYNOVITIC LOTION, (the Remedy, No. 2,) for grogginess, weak joints, sprains of the back sinews, ruptures of the sheaths of tendons, suspensory ligaments, shoulder lameness, and inflammation; also for the cure and prevention of breaking down, &c.—In bottles, large size, £1 1s.; small, 10s. 6d. each. The above invaluable remedies can now be forwarded to any part of the United Kingdom. Pro-payment by check or post-office order, made payable to Joseph Major, Post Office, Charing-cross.

JOSEPH MAJOR, Horse Infirmary, British-yard, Cockspur-street, Charing-cross.

## Oleum Jecoris Aselli.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.

Approved of and recommended by BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, FOUQUER, and numerous other eminent medical men and scientific chemists in Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the elements of the bile—in short, all its most active and essential principles—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

A pamphlet by DR. DE JONGH, with detailed remarks upon its superiority, directions for use, cases in which it has been prescribed with the greatest success, and testimonials, forwarded gratis on application.

The following are selected from some of the leading Medical and Scientific Testimonials in favour of Dr. de Jongh's Cod-liver Oil.

### BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

(Signed)

"DR. JUSTUS LIEBIG.

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

### Dr. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

"JONATHAN PEREIRA.

"Finsbury-square, London, April 18, 1851.

"To Dr. de Jongh."

Sold Wholesale and Retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by ANSAR, HARFORD, and Co., 77, STRAND, Sole Consignees and Agents for the United Kingdom and British Possessions; and by all respectable Chemists and vendors of Medicine in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d.

IMPERIAL MEASURE.

**Water Filter for the Pocket, with**  
 DRINKING-CUP and INSTRUCTIONS, and will filter any quantity  
 of Water. Size, 4 inches by 2. Price 3s. 9d.  
 J. SOLOMON, Wholesale Optician, and Photographic Depot, 23, Red Lion-  
 square.

**Mineral Waters.—W. Best begs to**  
 inform the Nobility, Gentry, and the Faculty, that he has just received  
 a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS  
 of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg,  
 Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-  
 de-Cologne, Arquebuzad, and Foreign Mineral Water Depot, 22, Henrietta-  
 street, Cavendish-square.—N.B. Balls and evening parties supplied with  
 German and Struve's Artificial Seltzer Water on Advantageous terms.  
 N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

**Blake's Aërated Citrate of Potash**  
 WATER.—BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, have  
 recently prepared an Aërated Solution of Citrate of Potash, which they beg  
 to introduce to those members of the profession who may desire it for  
 the use of their patients. It will be found a valuable auxiliary in the treatment  
 of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and  
 Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicar-  
 bonate in each bottle; Soda, 15 grains; Magnesia, 12 grains; and Ammonia,  
 10 grains. Seltzer, Vichy, and other foreign waters, from the respective  
 analyses.

**Schweppe's Soda, Potash, and Mag-**  
 NESIA WATERS, and AERATED LEMONADE, continue to be man-  
 ufactured upon the largest scale at their several establishments in London,  
 Liverpool, Bristol, and Derby. The celebrity of these well-known waters, and  
 the preference they universally command, are evidences that their original  
 superior quality over all others is well sustained. Every bottle is protected  
 by a label with the name of their firm, without which none is genuine, and it  
 may be had of nearly all respectable chemists throughout the kingdom. Im-  
 porters of the German Selters Water, direct from the springs, as for the last  
 twenty years.—61, Berners-street, London.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MARINA SALT FOR BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently  
 strengthening and beneficial properties to the same, that, when once tried, a  
 Bath will scarcely ever be taken without it. In the buoyancy and freshness  
 it produces in the system, it is far superior to any known Sea Bath.

Sold at 1s. per packet, by the Proprietor, C. MEINIG, 103, Leadenhall-street,  
 and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing  
 Establishments.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and Co., 2, BERNERS-STREET,  
 OXFORD-STREET, LONDON, Manufacturers of Mineral Aërated Waters,  
 and Patentees of the Syphon Vase and Valvular Stopped Bottle. The ob-  
 jection so generally made to the common soda-water bottle, in the inconveni-  
 ence attending its being opened, has induced Messrs. T. Mayo, Watson, and  
 Co., in addition to the Syphon Vase to introduce the VALVULAR STOP-  
 PERED BOTTLE, whereby the annoyance complained of is removed, the use  
 of both corks and wire being dispensed with, and the advantages arising to  
 those who are in the habit of drinking aërated waters (more especially ladies  
 and invalids) greatly enhanced, from the circumstance that any quantity, how-  
 ever small, can be withdrawn, whilst, at the same time, the portion remaining  
 in the bottle retains its gaseous properties unimpaired.—Applications having  
 been made to them for agencies for the sale of the Syphon Vase and Valvular  
 Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrange-  
 ments accordingly, and will be happy to treat with parties desirous of becom-  
 ing agents.

## Briet's portable Gazogène, OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-  
 beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the  
 same, cheaper and more effective than any other  
 preparation.

SELTZER POWDERS, prepared from a recent  
 analysis of the fresh water from the spring by a ce-  
 lebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler  
 PATENT PORTABLE FILTER, a cheap and  
 useful article, not occupying more than four to six  
 inches in space, and filtering from six to ten gallons  
 per twenty-four hours, suitable for Military, Navy, and  
 Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN,  
 and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be  
 adopted against all parties selling or exposing for sale  
 the imitations of the above-named articles, as the said  
 imitations are infringements upon these patents.

TO THE DENTISTS OF GREAT BRITAIN.

**Certain persons having endeavoured**  
 to obtain Letters Patent for the Continuous Enamelled Gum on Platinum  
 Plates, I remind you, that, having previously used it, I exhibited it at the  
 Great Exhibition. It is therefore open to the Profession generally, and I can  
 provide instruction for those unacquainted with its peculiarities.  
 2, Old Burlington-street. GEORGE WAITE, M.R.C.S.

**Purification of Linen—Prevention of**  
 DISEASE.—J. BOILEVE, 55, King William-street, City, London, solicits  
 the attention of the Nobility and Gentry to his CALORIFÈRE for drying by  
 hot air all the family linen, avoiding any contamination with those of un-  
 healthy persons, and thus removing the most shocking cause of disease.

69, Marybone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied  
 with the performance of your No. 3 Calorifère, lately put up for warming my  
 manufactory; it has been in operation for a month, and I believe it to be the  
 best and most economical means of drying yet invented, and particularly suited  
 to my business, as there is no dust arising from its use, as there is from the  
 old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boileve, Esq.

Firm of JOHN WOOLLAMS and Co., Paper-stainers.

**Warming and Ventilating, by Hot**  
 AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC  
 BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London,  
 respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the  
 following Testimonial, and begs to say he will attend personally any appoint-  
 ment:—

New Independent Chapel, Longsight, Manchester,  
 January 10th, 1853.

SIR,—I am instructed by the building committee of the above Chapel to  
 order one of your No. 3 Calorifères, for heating and ventilating the School in  
 connexion therewith. As the sub-committee, upon examination of most of the  
 public buildings, churches, and chapels in the town, find such general dis-  
 satisfaction with the existing apparatus and their imperfect heating and  
 ventilation, they have examined your Calorifère as in operation, and believe  
 it best adapted to meet their wants. It is intended, should it prove successful,  
 to apply another apparatus to the chapel.

To J. Boileve, Esq.

SAMUEL RIGBY, Secretary.

New Independent Chapel, Longsight, Manchester,  
 April 12th, 1854.

DEAR SIR,—I am authorized to inform you that the No. 4 Calorifère, erected  
 to warm the Longsight Independent Chapel, is in every respect satisfactory  
 to the committee and the congregation.

Yours respectfully,

To J. Boileve, Esq.

ROBERT RUMNEY, Chairman.

## Improved Adhesive Plasters.

BY SPECIAL APPOINTMENT.

LISTON'S ARNICA EMPLASTRUM ADHESIVUM. Trade price,  
 1s. per yard.

BERRY'S ARNICA PLASTER ON NICKELS'S PATENT ELASTIC  
 FABRIC. Trade price, 1s. 6d. per yard.

BERRY'S ARNICATED MECHANICAL CORN PLASTERS ON  
 AMADOU. Trade price, 7s. per gross.

The spread Plasters are specially recommended to the Profession as superior  
 to any others for healing incised wounds, cuts, and bruises. The Patent  
 Elastic Plaster is particularly applicable to wounds on the face or hands, as it  
 may be accurately fitted on the parts to which it is applied. They are pre-  
 pared by a process by which the medicinal properties of the Arnica are pre-  
 served. The Arnica Montana has long been in repute as a popular and  
 domestic remedy on the Continent. Disraeli notices this in "Tancred;" he  
 tells us that Baron administered it to Tancred, when wounded by the Arabs.  
 Its virtues were first communicated to the Profession by a Physician named  
 Fehr; 150 years later, Dr. Hahnemann ascertained its effects on the human  
 body, and proved its specific properties. The late Professor Liston employed  
 it with great success, and its use is recommended by many of the most  
 eminent of the Faculty.

Sole Proprietor, JOHN PARTON BERRY, Chemist and Perfumer in  
 Ordinary to the Queen, Northampton.

London Wholesale Agents—BENJAMIN NICKELS, 9, Camberwell-green;  
 SOLOMON MAW, 11, Aldersgate-street.

Samples sent Post Free.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment, in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSLEY PELLATT and CO. submit the following PRICES of VIALS, for  
 PRE-PAYMENT only:—

1 oz., 1 oz., and 1½ oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 7s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4½ oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than  
 Six Gross, assorted to suit the con-  
 venience of the purchaser, de-  
 livered to carriers in London.  
 No charge for Package.  
 Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges  
 whatever between the Manufacturer and the Consumer, no attention can be  
 paid to any order not accompanied by a remittance in full, made payable in  
 London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
 FALCON GLASS WORKS, LONDON.

**Caution!—Messrs. Allsopp and Sons**

And it is necessary to caution the Public, and especially Shippers of their Ales to the Colonies, against frauds committed by parties in selling spurious Ales for those of Messrs. ALLSOPP & SONS.

Messrs. ALLSOPP & SONS have felt compelled, by the extent to which this disgraceful practice has been carried, to proceed, in several cases, by obtaining Injunctions from the Court of Chancery; and have ultimately been driven to prosecute criminally, for the commission of this offence. They beg to call attention to the case of "THE QUEEN v. GRAY & GOSLIN," in which Lord Campbell sentenced the parties charged to TWELVE MONTHS' IMPRISONMENT WITH HARD LABOUR.—*See Times and Morning Advertiser of the 18th May.*

Messrs. ALLSOPP & SONS will thank all persons having reason to doubt the genuineness of any article sold under their name, to send them the earliest information, in order that immediate steps may be taken for prosecuting the parties.

Messrs. ALLSOPP & SONS will be happy to furnish the names of respectable houses, where a supply of their Ales may be depended on, as genuine from the Brewery.

Brewery, Burton-on-Trent.

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 6d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

**The App's Brewery.—To Devon's**

fair country is the palm given, and that which has been hitherto deemed impossible has at length been accomplished, by the combination of nature and art, at the App's Brewery, Littleham, Devon. An ALE, pronounced by the great chemist HUMPHRY to be pure, clear, and well brewed from water of the finest saline and tonic ingredients, unapproached by any within his cognizance, is offered to the Public, at a moderate price, by WILLIAM WICKHAM, Sole Consignee, Bideford, Devon, and at his Stores, 2, Hungerford Wharf, Charing-cross, London.

**Baron Liebig on Allsopp's Pale Ale.**

"I am myself an admirer of this beverage, and my own experience enables me to recommend it, in accordance with the opinion of the most eminent English physicians, as a very agreeable and efficient tonic, and as a general beverage, both for the invalid and the robust."—Glasen, May 6.

ALLSOPP'S PALE ALE ONLY IS BOTTLED by PARKER & TWINING, Beer Merchants, 64, Pall-Mall.

IMPERIAL MEASURE.—Quarts, 8s.; Pints, 5s.; Half-pints, (for luncheon), 8s. per dozen. Also in Casks of 16 gallons and upwards.

**Allsopp's Pale Ale.—Medical gentle-**

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1863, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BREWERY PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Tobacco Smoking.—Tobacco Smoke**

contains two very powerful poisons, which, when absorbed by the system, as in ordinary smoking, produce many serious diseases destructive of the physical and mental health of the smoker.

PHILLIPS and CO.'S Patent Condensing and Filtering Pipes and Stems for Meerschaums are the only inventions known that permit of healthful smoking, and which the medical profession will find worthy of their notice as a valuable therapeutic agent in all cases where the smoking of tobacco and stramonium may be desirable.

Read the Smoker's Friend, or the Philosophy of Smoking, which may be had gratis of all Phillips and Co.'s agents, and also of the Patentees and Manufacturers, 9, Lyon-street, Caledonian-road, Islington, London, who will send them post free to all applicants.

A Pipe or Stem sent post free, price 2s. each, or two for 3s. 6d.

**To Invalids and those desirous of**

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**DOMESTIC ECONOMY****H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb. Fine Souchong, 3s. 4d., 3s. 8d., and 4s. Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s. Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s. Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 373, Oxford-street, London.

**Soyer's Aromatic Mustard.—"M.**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**The Tea Tax off, the War Tax on.—**

THE DUTY ON TEA has this day, April 5, been REDUCED 4d. per lb.—THE EAST INDIA TEA COMPANY will as usual give the public the full benefit of it. War expenses must be paid, and what so likely as a new duty on Tea. Save your already increased income tax, and order at once, or you may be too late. Black Tea cannot be less than 2s. 6d. per lb., the Company's present price; good and strong to fine, from 3s. to 3s. 8d., and upwards; the best 4s. Tea in London; Green Tea equally cheap. Coffee, from 10d.; Old Mocha, 1s. 3d.; Rich and Ripe, five years old, 1s. 7d.

East India Tea Company's Office, 9, Great St. Helen's, Bishopsgate-street.

**Matrimonial Institution.—Founded**

1846.—Offices: 13, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 13 postage stamps, by order of the Director, LAURENCE CURZANUS, 13, John-street, Adelphi, London.

**Dr. Kahn's Museum, (top of Hay-**

market,) Piccadilly, consisting of 800 Anatomical Wax Models, open Daily; Lectures by Dr. SEXTON, F.R.G.S., and F.E.S.—Admission, One Shilling.

Dr. KAHN executes all descriptions of Anatomical Wax Figures, on the shortest notice, and the most reasonable charges.

**University of London.—Notice is**

Hereby Given, That the FIRST EXAMINATION for the Degree of BACHELOR OF MEDICINE, for the present year, will commence on Monday, the 7th of August. The Certificates required must be transmitted to the Registrar fourteen days before the commencement of the Examination.

By order of the Senate,

Somerset House, June 30, 1864.

R. W. ROTHMAN, Registrar.

**Essex and Herts.—Benevolent Medi-**

CAL SOCIETY, Established, 1790.—Notice is hereby given, That the ANNUAL GENERAL COURT OF AUDIT of this useful and important Institution, will be held on Monday, the 17th day of July instant, at the Brunswick Hotel, Blackwall. The general business of the Society will commence at One o'clock precisely, and Dinner on table at Four o'clock precisely. Sir JOHN FORBES, M.D., D.C.L., has kindly consented to preside on the occasion. Gentlemen (Medical or otherwise) friendly to the objects of the Society, are invited to attend.

It is proposed to move, by Dr. DAVIES, "That the District Courts be abolished, and the whole business of the Society be transacted at the General Court of Audit, to be held annually, at the place appointed at the immediately previous Court of Audit; and that all Petitions, Letters, and other Documents relating to the Society, be transmitted to the Secretary, properly signed and vouched for fourteen days, at the least, before the Annual Meeting of the Court." Also, that a Committee be appointed to Revise the Laws of the Society, so as to adapt them to the change caused by the foregoing Resolution.

Hertford, 1st July, 1864.

JOHN G. AUSTIN, Secretary.

**King's College, London.—Medical**

DEPARTMENT.—The WINTER SESSION, 1864-5, will Commence on Monday, October 2, 1864.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D., F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

Logic and Natural Philosophy, as required by the Army Medical Board.

**KING'S COLLEGE HOSPITAL.**

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Waverford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1864.

R. W. JELL, D.D., Principal.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND AMBULANCES, AND LUNATIC  
ASYLUM REGISTRARS,  
14, JOHN STREET, ADELPHI.

Office hours from 12 till 4.

**In a Western Suburb, a non-dispen-**  
sing GENERAL PRACTICE, yielding between £200 and £400 a year, and capable of any extension, is offered, with the lease and furniture of a licensed house, admirably adapted for insane, imbecile, or nervous patients of the first class, for £1600, of which the greater portion may remain on good security at 5 per cent.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Receipts last year £1250. Price,**  
£1000, one year's Partnership Introduction to the best GENERAL PRACTICE in a large and influential eastern district of the Metropolis; lowest Midwifery fee, £1 1s. The double qualification indispensable.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**Wanted, an Assistant, (qualified,)**  
not under twenty-six years of age, to take charge of a Branch Practice in the county of Durham.—Address, B. B., 28, Liverpool-terrace, Liverpool-road, Islington.

**A Surgeon and Apothecary, accus-**  
tomed to Country Practice, wishes to engage himself as a Visiting ASSISTANT, he would prefer a situation with a prospect of a Share in, or Succession to, a Practice.—Address, S. U. R., Mr. Maddox, 10, University-street.

TO THE PROFESSION.

**A Gentleman (sine diplomate) is open**  
for immediate re-engagement, as ASSISTANT, to Visit, Dispense, and attend Midwifery. Unexceptionable testimonials and references.—Address, Medico, Post-office, Blackburn.

**For Disposal, a Medical Practice,**  
with an Appointment (not Union), worth £200 per annum. Receipts from private practice, near £200 per annum. Premium, including a well-stocked Surgery, £250.—Address, Beta, THE LANCET Office, 423, Strand, London.

**Medical Assistant.—A Gentleman,**  
thirty-five years of age, of much practical experience in Midwifery, and the usual routine of a Country Practice, is open for a RE-ENGAGEMENT. The advertiser desires a permanency.—Address, H. Thomas, Bancroft, H. H. H.

**To be Disposed of, on Easy Terms,**  
a SURGEON'S PRACTICE and RETAIL, situate in a Populous and Improving Suburb. To a qualified and energetic man this possesses peculiar Advantages.—For particulars apply to A. B., St. Marylebone Infirmary, New-road.

**A Surgeon of Superior Qualifica-**  
tions, aged 36, would be glad to Assist in, or take the Charge of, a respectable Practice, during the next two or three months, July, August, and September. A fair remuneration expected.—Address, M. D., THE LANCET Office, Strand, London.

**Medical Pupil.—A Medical Man,**  
whose connexion with a Hospital in London enables him to offer many advantages, is willing to receive into his house a well educated youth of steady habits, as PUPIL. Terms, &c., may be known on application, by letter, to M. R. Welton, 213, Oxford-street.

**Partnership. — For Disposal, a**  
GENERAL PRACTICE (Town and Country), realizing upwards of £1200 per annum, in a Fashionable Watering-place with a population of 40,000. The Practice, with the aid of an active partner, is capable of considerable increase.—Apply to A. Z., Post-office, Cheltenham.

**A Partnership in a good General**  
Practice Wanted, by an M.R.C.S. and L.A.S., aged twenty-eight, where the present occupier is still active, but wishes to relieve himself of the more arduous portion of the Practice. Principals only will be treated with.—Address, C. S., care of Mr. Lewis, Medical Bookseller, 15, Gower-street North.

**Five Hundred Pounds per Annum.**

—A General PRACTICE, in a populous Rural district, where there is little opposition, is for Disposal. The returns amount to about £500, inclusive of £112 from appointments. No low Midwifery. There is a good residence, with Stabling and Thirty Acres of Orchard attached, at low rental. Premium £450.—Apply to Mr. ORRIDGE, 30, Backlensbury.

**Bayswater.—The nucleus for the**

formation of an extensive PRACTICE offers, under peculiar circumstances, in this eligible locality. The position of the residence is particularly adapted for a medical man. The house is secured at a low rental on beneficial lease. The present business is about £250 per annum. A premium will be required for the lease and goodwill. The furniture by valuation.—Apply to M. D., care of Mr. ORRIDGE, 30, Backlensbury, Chesham.

**West of London.—In a favourite**

district, about six miles from the Bank, a PRACTICE is Transferable, with Lease of commanding Corner House. A short Introduction only can be given. The position will be found advantageous by a gentleman desirous of residing in an agreeable and popular locality. (The entrance will not exceed £250.—Apply to S. G., care of Mr. ORRIDGE, 30, Backlensbury.

**A Gentleman of considerable expe-**

rience, and fully qualified, is desirous of obtaining an Out-Door Situation as ASSISTANT; one where there is a prospect of the Advertiser having the option of purchasing a share in the Practice will be preferred.—Address, by letter, A. B., 87, Park-terrace, Green Hayes, Manchester.

**A Member of the College and Hall,**

aged twenty-nine, of great experience in all branches of the Profession, offers his services as ASSISTANT to a Gentleman in Respectable Practice, either in Town or Country. The Advertiser is conversant with Union Practice, and his Testimonials as to Character and Ability are unexceptionable.—Address, stating Terms, &c., to Medico, THE LANCET Office, 423, Strand.

**Mr. Wilkins, residing at Bedford**

Cottage, Walmer, Kent, receives PUPILS, to prepare for the Public Schools. During the ensuing vacation (from July 25th to September 11th), or earlier, he will be happy to take charge of three or four little Boys requiring Sea Air and Bathing. The House is surrounded by a large Garden, and is within a short walk of the Beach.

TO CHEMISTS AND DRUGGISTS.

**Wanted to Apprentice a Youth to**

the above Business for four or five years; age between fifteen and sixteen years; distance from the Metropolis fifteen miles, and not exceeding thirty, would be preferable.—Application, by letter, to be made to A. B., Mr. Archbutt, 20, Bridge-road, Lambeth.

**A Gentleman with a double quali-**

fication, who has long practised with much success in the country, wishes now to Purchase the Succession to a small General PRACTICE in a town, or to enter into Partnership with a highly respectable medical man who may wish a partner fully competent to co-operate with him. A large town preferred.—Address, M. D., care of R. Smith, Esq., 24, Bliffet-street, City, London.

TO SURGEONS AND CHEMISTS.

**The Business of a Chemist, in the**

most improving part of Brighton, doing upwards of £200 per annum, to be Disposed of for the value of the stock and fixtures. Furniture may be taken; rent very moderate; a good opening for a Surgeon.—Apply to Messrs. May and Sweetland, Solicitors, 14, Queen-square, Bloomsbury, or to Bowen May, Esq., Brighton.

**Clerical, Scholastic, and Governess**

AGENCY OFFICES, (late Vajpy, Established 1838.) 7, TAVISTOCK ROW, COVENT-GARDEN, LONDON. The gentry and families requiring Tutors, Governesses, or Companions, for either residence, travelling, or daily attendance, on making known their requirements to Messrs. MAIR and SON, will at once be introduced FREE OF CHARGE to qualified and experienced applicants with good testimonials. Schools recommended, and Ecclesiastical and School property transferred. A prospectus forwarded on application.

**The General Hospital, Birmingham.**

—DISPENSER WANTED.—In consequence of the resignation by Mr. Alfred Atkinson of the Office of Dispenser to this Institution, the Committee will proceed to the Election of a Competent Person to fill the Vacancy, on Friday, the 29th of July next. The Salary will be £300 per Annum, with board in the Hospital.

Applications, Testimonials, &c., must be sent in under cover to the Secretary, at the Hospital, on or before Thursday, the 29th of July next.

Committee Room, 30th June, 1854.

ROB. J. NEWMAN, Secy.

**South Staffordshire General Hospital.**

—HOUSE-SURGEON.—The Vice-Presidents and Directors will proceed to the Election of a gentleman to fill the office of HOUSE-SURGEON to the South Staffordshire General Hospital, on TUESDAY, the 1st day of August next. Candidates must send in their Testimonials and Qualifications under cover, to the Secretary, on or before SATURDAY, the 22nd day of July next, in order that the same may be submitted to the Board for Examination. Candidates must be Members of the Royal College of Surgeons in London, and Licentiates of the Apothecaries' Company in London. They must be unmarried, and between twenty-five and forty years of age. The Salary, which is permanent, will be £75 per annum, with Board, Washing, and suitable Apartments.

By order of the Weekly Board.

BENJAMIN SMITH, Secy.

Keate, Esq.

APPENDIX.

Annual Report of Cases admitted into the Medical Wards of St. George's  
Hospital during the Year ending Dec. 31, 1863. By Dr. Barclay, Medical  
Registrar of the Hospital.

London: John Churchill, and Samuel Highley.

Just published, illustrated with 169 Engravings, 8vo, cloth, 18s.

**Operative Ophthalmic Surgery;**

Including Surgical Diseases of the Eye. By HAYNES WATSON, Esq.,  
F.R.C.S., Surgeon to the Central London Ophthalmic Hospital, and Assistant-  
Surgeon to St. Mary's Hospital.

"It is some time since we had the pleasure of perusing an off-hand, manly  
book on eye-surgery; and some time, too, since we met one conspicuous for  
its honesty. The work is, in fact, a fair, intelligible account of the operations  
required in eye-surgery, with no small amount of illustrative comment on the  
diseases which render them necessary, and the treatment which contributes  
to their success. Something of the kind was just now wanted, and we rejoice  
to see the want so well supplied."—DUBLIN MEDICAL PRESS.

"It must have cost Mr. Watson much labour, but he has already been  
rewarded for it stamps his character at once as a sound and experienced  
ophthalmic surgeon."—MEDICAL TIMES AND GAZETTE.

London: John Churchill, Princes-street, Soho.

WORKS BY MR. COULSON,  
SURGEON TO ST. MARY'S HOSPITAL.

**On Lithotritry and Lithotomy; with**

Engravings on Wood. 8vo, cloth, 8s.

"The most complete monograph upon the subject which has yet appeared  
in our language."—ASSOCIATION MEDICAL JOURNAL.

II.  
**ON DISEASES OF THE BLADDER AND PROSTATE**  
GLAND. The Fourth Edition, revised and enlarged. 8vo, cloth, 10s. 6d.

"Mr. Coulson's work may be stated to be full and practical, to fill a vacant  
space in medical literature, and to be highly valuable to both students and  
practitioners."—MEDICAL TIMES.

"The practical and comprehensive character of Mr. Coulson's volume  
claims for it a place in the library of every surgeon who desires to be on a  
level with modern improvements."—LONDON JOURNAL OF MEDICINE.

London: John Churchill, Princes-street, Soho.

On the 1st of July, 1864, was published, Vol. XIX., post 8vo, cloth, 6s. 6d.

**HALF-YEARLY ABSTRACT OF THE MEDICAL SCIENCES.**

EDITED BY W. H. RANKING, M.D. CANTAB.;

AND

C. B. RADCLIFFE, M.D. LOND.

LONDON: JOHN CHURCHILL, PRINCES-STREET, SOHO.

PRINTED BY THOMAS CHOATE SAVILL, at his Printing Office, No. 4 Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the  
county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster,  
in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—  
Saturday, July 8, 1864.

# THE LANCET.

Journal of British and Foreign Medicine, Physiology, Surgery, Chemistry, Criticism, Literature, and News.

Also a **BOTANICAL APPENDIX.** By **MISS HAWKINS.**  
Bradbury and Evans, 11, Boulevard-street, London; to be had of all Booksellers, and at all Railway Stations.

This day is published, price 2d., No. 3, of

# The Epitome, a Weekly Journal of

Literature, Criticism, Art, Science, and Manufactures; comprising Fiction of the highest class, Reviews of new Works, all the Scientific Intelligence of the week, a list of Patents, with abstracts of Specifications, a Domestic Miscellany, and Correspondence; 32 pages, 8vo.

Office, 49, King William-street (City), London.

Order of all Booksellers and News-vendors in the Kingdom.

## Mayall's Daguerreotype Portrait

GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

## Allen's Illustrated Catalogue, con-

taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

Allen's Registered Despatch-box and Writing-desk, their Travelling-bag (with the opening as large as the bag), and the new Portmanteau, containing four compartments, are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Furniture, and Military Outfitters, 18 and 22, Strand.

## H. Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-torrey, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**If you require Family**

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seals, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, 41s. 1s.; Arms Painted, Empanelled, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, Illuminated, and Emblazoned on Vellum.

H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## To Professional Men and others.—

The Oxford Mixed Doeskin Trousers, price 21s. The Striatus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 160, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## Whypay more than Sixteen Shillings

for your TROUSERS?—MILES, of 62, New Bond-street, has the pleasure to inform the ready-money public his Show Rooms are replete with all the new Patterns in SCOTCH ANGOLAS, for Spring and Summer wear, at 16s. per pair. No connexion with any other house. Gentlemen are requested to note the address. Patterns and directions for self-measurement forwarded on application. Orders must be accompanied by post-office orders.

## A Thoroughly Good Fitting Garment

INDISPENSABLE.—To those who have been pestered with badly-cut garments, J. SANDS begs to state that, having had great experience in studying the human form, he will engage to fit the most difficult figure or please the most fastidious taste. In passing his Establishment, 17, HOLBORN HILL (opposite Furnival's Inn), it will be seen that every peculiarity of style is consulted, both in price and pattern. Dress and Frock Coats from 35s. to 70s.; Black Dress Waistcoats, from 8s. 6d., and Trousers from 21s. Fancy Clothing and Juvenile Dresses in great variety.

## To all who cannot get a Fit; the

importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance.

R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

## Cocoa-nut Fibre Matting and Mats,

of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographie Dépôt, 22, Red Lion-square.

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

TO SURGEONS.

## Messrs. Shoolbred & Bradshaw beg

to call the attention of Medical Gentlemen to their PATENT ELASTIC STOCKINGS, KNEE-CAPS, SOCKS, &c. The particular property of the Stocking is to give constant support in varicose veins, weak, swollen, or dropsical affections of the leg, or in any case requiring constant and equal pressure. The Knee-Cap will be of great use where the knee-joint requires support from accident to the pan of the knee, after inflammation, rheumatic, or gouty affections. The Stock affords great support to the ankle-joint after fractures and dislocations, or in any case where, from weakness of the part, support may be necessary. Suffice it to say, wherever common bandages are necessary, the Patent Elastic Invention will beneficially supersede their application, as they yield an equally diffused pressure over the part affected.

To be had of the Patentees, 34, Jernyn-street, St. James's, London.

## Cotyledon Umbilicus.—Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## The Royal Turkish Towels.—Under

the Patronage of her Majesty the Queen, and which received the Prize Medal at the Great Exhibition. The Brown Linen combines the advantages of a Flesh-brush with the qualities most desirable in a Towel; the white Cotton is the softest Towel ever made, and absorbs moisture without the necessity of using friction.

To be had of all respectable Linendrapers.

## Notice.—Berdoe's Ventilating

WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing; and, being free from vulgar singularity, are adapted for general use, equally as for rainy weather. Price 45s. and 50s. A large stock for selection, also, of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.

W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

## Funeral Extortion avoided, by Exe-

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEE'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibee's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, 28; Artisan's, 24 and upwards, Originated in 1842.

DOUBLE PATENT.

## Briet's portable Gazogène,

OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SEITZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler. PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN, and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

## Recherché Wines! — First-growth

Wines only! At the following very reduced prices, on cash terms only:—  
 Sherry—"Amontillado and Montilla character." In Dock, at £52 per Butt, £26 per Hhd., £13 per Quarter Cask. Duty paid—£21 per Quarter Cask, £42 per Hhd., £24 per Butt, 42s. per dozen.

Port—Very rare old Wines, 42s. and 54s. per dozen. Connoisseurs who cannot suit their taste, except on rare occasions, are invited to try these Wines. Vintage Ports for laying down.

The qualities of Wines most prized being different, some preferring pale, others brown, some dry, some fruitiness and smoothness, all of which are consistent with purity, gentlemen are solicited to call and taste the Wines at Mr. HAMMICK'S Offices, No. 11, Pall-mall, London.

First class! Champagne, Moselle, Hocks, Clarets, Sauterne, &c., at the most moderate prices.

These Wines are patronised and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples, with List of Prices, forwarded on application.

There being no credit on freights, neither on duties, and to buy in the best market, cash terms command every advantage, and are essentially requisite to obtain the best and purest Wines at the lowest possible prices.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREW'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.  
 FURTHER GREAT REDUCTION IN PRICE.

## Crew's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crew's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.  
 Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

IMPORTANT TO THE MEDICAL PROFESSION.

## Davenport's Syrup of the Iodide of QUININE AND IRON.

FROM DR. GOLDING BIRD.

"46, Russell-square.

"I have now for some time employed pretty largely the triple Compound of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the form of Syrup. I do not hesitate to express my opinion of its great value as a therapeutic agent. It has appeared to me that the Quinine assisted the assimilation of the Iron, and I have found it to be of very great value in cases in which the use of the Iodide of Iron is recognised. This triple Compound possesses many advantages over the simple Iodide, and not the least of them is the satisfactory manner in which it is tolerated by the stomach, especially if administered (as all preparations of Iron ought to be) immediately after a meal."

"GOLDING BIRD, A.M., M.D., F.R.S.  
 "Fellow of the Royal College of Physicians,  
 "Physician and Professor of Materia Medica, at Guy's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with confidence testify to its marked efficacy in cases of Struma and Anæmia, and, indeed, in all instances in which the exhibition of Iron and its Compounds is indicated. This preparation appears to combine all the therapeutic powers of its constituents, without their nauseous qualities, which renders it an admirable medicine in the treatment of some of the disorders of Childhood."

"Maldon.  
 "Geo. P. May, M.D."  
 SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 25 per cent. of Quinine. 4s. 6d. per oz.

SYRUP OF THE IODIDE OF IRON (P.L.), 3s. per lb.

BI-MECONITE SOLUTION OF OPIUM. Professional testimonials acknowledge this preparation to be the most efficient sedative extant. The unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30 Drops. 8d. per oz.

COTYLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and 1s. per oz. also the Preserved Juice, 6s. 4d. per lb., as recommended by Mr. Salter, (of Poole,) in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, GREAT RUSSELL-STREET, BLOOMSBURY.

## JOZEAU'S COPAHINE MEGE

Or SACCHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 9d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Erated Waters, and Patentees of the Syphon Vase and Valvular Stoppered Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPERED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking erated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stoppered Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

## Improved Adhesive Plasters.

BY SPECIAL APPOINTMENT.

LISTON'S ARNICA EMPLASTRUM ADHÆSIVUM. Trade price, 1s. per yard.

BERRY'S ARNICA PLASTER ON NICKEL'S PATENT ELASTIC FABRIC. Trade price, 1s. 6d. per yard.

BERRY'S ARNICATED MECHANICAL CORN PLASTERS ON AMADOU. Trade price, 7s. per gross.

The spread Plasters are specially recommended to the Profession as superior to any others for healing incised wounds, cuts, and bruises. The Patent Elastic Plaster is particularly applicable to wounds on the face or hands, as it may be accurately fitted on the parts to which it is applied. They are prepared by a process by which the medicinal properties of the Arnica are preserved. The Arnica Montana has long been in repute as a popular and domestic remedy on the Continent. Disraeli notices this in "Tancred;" he tells us that Baroni administered it to Tancred, when wounded by the Arabs. Its virtues were first communicated to the Profession by a Physician named Fehr; 160 years later, Dr. Hahnemann ascertained its effects on the human body, and proved its specific properties. The late Professor Liston employed it with great success, and its use is recommended by many of the most eminent of the Faculty.

Sole Proprietor, JOHN PARTON BERRY, Chemist and Perfumer in Ordinary to the Queen, Northampton.

London Wholesale Agents—BENJAMIN NICKELS, 9, Camberwell-green; SOLOMON MAW, 11, Aldersgate-street.

Samples sent Post Free.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronised and used in their hospital and private practice:—J. C. W. LEY, M.D. Physician Accoucheur, Guy's Hospital. Mr. FRAZESSOR, Surgeon to his Royal Highness Prince Albert. Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital; Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

NEMO SIBI VIVAT.

## Medical, Legal, and General Mutual

LIFE ASSURANCE SOCIETY.  
126, Strand, London.  
FOR HEALTHY AND DISEASED LIVES.  
Established A.D. 1846.

TRUSTEES.

The Policies of this Office are a sure and safe provision for settlements, renewal of leases, security of debts, &c.

The Medical Attendant consulted as the Medical Adviser and Examiner of the Society, is awarded a fee of £2 2s., when the sum assured amounts to £250, and £1 1s. when under that sum. The Medical Practitioner also receives for business introduced by him the usual commission of ten per cent. on the first payment, and five per cent. on the payments of subsequent years.

The Society also claims the support of the Medical Profession on the following grounds:—

For several years the "Medical, Legal, and General" was the only Mutual Life Assurance Society connected with the Medical Profession.

The rates are lower than those of any other Medical Life Office.

Bonuses divided annually.

Persons desirous of assuring Diseased or Rejected Lives will find that from the experience acquired by this Society it is enabled to accept such lives at rates both equitable and safe.

From the outset the expenses of management have been kept within the narrowest limit, consistent with the efficient working of the establishment.

Loans, Annuities, Endowments, and every form of assurance contingent upon Life, transacted at moderate rates.

ANNUAL PREMIUM FOR ASSURING £100 AT DEATH WITH PROFITS.

Age.	Premium.	Age.	Premium.	Age.	Premium.	Age.	Premium.

Prospectuses, forms, and any further information may be obtained of

FREDERICK JAMES BIGG, Actuary and Secretary.

The Medical Directors are the Examiners of the Society, one of whom is always in attendance on Mondays at 3 o'clock, and on Fridays at 4 o'clock.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

**TISSUE**, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

**BROWN'S TISSUE DRESSING**.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.  
"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown,"

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury."

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

CAPITAL:—ONE MILLION STERLING.  
THE WHOLE PAID UP AND INVESTED FOR HALF A CENTURY.

## Globe Insurance,

CORNHILL AND PALL MALL, LONDON.  
ESTABLISHED 1803.

FIRE: LIFE: ANNUITIES: REVERSIONS.

JAMES W. FRESHFIELD, Esq., M.P., F.R.S., Chairman.  
FOWLER NEWSAM, Esq., Deputy-Chairman.  
GEORGE CARR GLYN, Esq., M.P., Treasurer.

The NEW TABLES adopted by the GLOBE include two Scales of Life Premiums, *Participating* and *Non-Participating*, combining, with moderate rates, those principles of solidity and security which have distinguished this Company from its formation.

Two-thirds of profits apportioned as Bonus.

One-third of the Premium may remain *Unpaid* as a debt upon the Policy.

Facilities afforded to Insurers.

Insurances to the extent of TEN THOUSAND POUNDS on a single approved Life.

Every class of FIRE and LIFE Insurance business transacted.

Prospectuses, with full Tables and Details, and Forms, may be had at the Company's Offices, or of the Agents.

WILLIAM NEWMARCH,  
Secretary.

## Shower and all Domestic Baths.—

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECURRENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

## The Pulvis Jacobi Verus, prepared

by WILLIAM HOOPER, 24, Russell-street, Covent-garden, from its identity with the more costly preparations, and its acknowledged efficacy as an Antimonial, merits the patronage of those gentlemen who have not hitherto included Pulvis Jacobi in their daily Materia Medica. An extensive continuous demand for Public Institutions has satisfactorily verified the ancient character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 6d. and 10s. 6d.; and in packets for transmission by post.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

FOR EPILEPSY.

## Cotyledon Umbilicus.—The intro-

duction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter never used any but what he has obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

## Hooper's Inspissated Juice of Tarax-

ACUM, prepared by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE OF SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—DR. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

INSPISSATED JUICE OF COTYLEDON UMBILICUS, for Epilepsy, introduced by Mr. Salter, of Poole (see "Medical Gazette" of March 2nd and May 11th), for whom Mr. Hooper first prepared it, and has continued to do so, Mr. Salter finding it to possess the properties of the fresh juice.

The following remarks of the Rev. A. Leapingwell show the value of Taraxacum when properly prepared:—

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it.

"I remain, yours truly,

"ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Sleaford

BRIGHTON SELTZER WATER, 4s. per doz. Other factitious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

# A Course of Lectures ON DISEASES OF THE EYE,

Delivered at the Medical School of the London Hospital.

By GEORGE CRITCHETT, Esq., F.R.C.S.,

SENIOR TO THE ROYAL LONDON OPHTHALMIC HOSPITAL; LECTURER ON SURGERY AT THE LONDON HOSPITAL, ETC.

## LECTURE VI.

*Treatment of ulcer of cornea in its various stages; acute and spreading; glassy; vascular; advantage of issues; corneal opacities. Corneitis: its history; pursues a definite course: treatment; expectant; a severer form occasionally seen; its symptoms: treatment.*

GENTLEMEN,—In my last lecture I described the principal aspects under which ulceration of the cornea presents itself to our notice. I have now to consider the treatment best adapted to each form or stage of this disease. In all cases in which you have ascertained with certainty the existence of an ulcer of the cornea, it is a good precaution to impress the fact on the mind of the patient or some friend, and to remind them that, under the most favourable circumstances and the most judicious treatment, a permanent opacity must be expected; otherwise, as the cure is accomplishing, they become dissatisfied, and the blemish, which is to the surgeon the proof of success, may be attributed to inefficient or improper treatment. If, however, the partial eclipse be predicted, credit is rather gained than lost when the prediction is fulfilled. During the first stage, mentioned in the last lecture, that in which the ulcer is in process of formation, there is usually an excess of local action in the conjunctival membrane, and the usual symptoms of acute ophthalmia. Soothing applications, such as poppy fomentation or warm water, together with the local abstraction of blood by means of a few leeches to the temple, followed up by counter-irritation behind the ear, are the most likely means of arresting the ulcerative process; at the same time, it may be necessary to sustain the general power, and counteract by constitutional treatment any abnormal state of system that may exist. Thus, in children, struma is often found in league with corneal ulceration. At puberty the menstrual function may be at fault; prolonged lactation is a fertile and very embarrassing cause; and, later in life, a feeble, shattered, and physically depraved state of system, the result of constant and prolonged intemperance, gives rise to ulceration of the cornea. These various conditions must be combated with such means as we have; and we must ever bear in mind, if we would be successful practitioners, that the most active and destructive inflammatory and ulcerative processes are compatible with, and even dependent upon, a very feeble state of system, which may require tonics, stimuli, and a very liberal dietary for their cure. This point I have already insisted upon, but I hold it to be of such importance, and so very imperfectly recognised by the profession generally, that I take every available opportunity of urging it. I cannot but rejoice to find this view ably developed and abundantly illustrated in the lectures delivered last summer by Mr. Skey at the College of Surgeons. I very early imbibed this opinion from my late teacher, Mr. Tyrrell; subsequent experience has given me almost daily evidence of its truth, and I cannot but hope that the eloquent appeal that has been made from so high an authority, and to such an audience, will result in the establishment of so important, so vital a principle.

In cases of acute and spreading ulcers, where penetration of the cornea is threatened, it becomes a matter of extreme importance to determine whether there is any means of arresting the progress of the ulceration. However judiciously the constitutional treatment may be conducted, there is every fear that penetration may occur before a favourable reaction has time to take place; it, therefore, is an anxious question, whether we can, by any local application, bring about an altered action in the part, and avert the impending danger. It is in such cases as these that I have found the nitrate of silver, in substance, of great value; it should be finely pointed, and carefully limited as much as possible to the ulcer itself; in order to effect this object, glycerine should be dropped into the eye previously, so as to protect the remainder of the surface from the action of the caustic. It seldom requires repeating more than once or twice, and it will frequently be found that the ulcer will begin to fill up and heal from that time. In other cases, it must be

No. 1611.

admitted that the effect is less favourable—that it is productive of considerable pain, of increased inflammatory action, and of infiltration of matter between the corneal layers. This I have chiefly observed amongst the old and feeble; but the happy result that occurs in numerous cases, and the extreme urgency and threatening aspect of the symptoms, fully justify and even suggest the plan I am now advocating.

I have usually observed that these ulcers occupy a considerable area; and if we are unable to arrest their progress, and penetration occurs, the iris immediately falls forward, in contact with the opening, which, gradually enlarging, allows of its protrusion, and thus “prolapseus irides” occurs; the natural resisting power and elasticity of the globe is weakened, the prolapse increases, the anterior surface of the eye bulges forward, and staphyloma occurs. It is very desirable, if possible, to obviate this latter result; and here, again, it has been suggested to apply the nitrate of silver, in substance, to the protruded part. The objection to this plan is, that it often causes severe pain, and is by no means uniformly successful, and therefore I cannot recommend it. I much prefer either puncturing the prolapse with a needle, which often causes it to contract and shrivel away, and thus to close up the corneal opening; or in case that fail, and the protrusion still increases, to remove it entirely. Under the most favourable circumstances, when disease has produced such results, the integrity of the organ is seriously compromised; but it is quite possible that sufficient space may be preserved for the formation of an artificial pupil, and under any circumstances, it is most desirable to prevent the occurrence of a large staphylomatous protrusion.

In the glassy ulcer, there is very little to combat locally, the conjunctiva is very slightly injected, there is no surrounding opacity in the cornea, and no indication of any morbid action in the part, except the loss of substance. Here we have evidently an error of nutrition, and our chief efforts must be directed toward the constitutional condition of the patient. We must endeavour to correct, as far as possible, the baneful influences to which such patients have usually been exposed, in the shape of impure air, small, ill-ventilated abodes, insufficient and unwholesome food; giving, at the same time, such medicines as are calculated to assist in sustaining the general powers of the patient. This object it is often very difficult to effect. We suggest changes which poverty and ignorance are either unable or indisposed to adopt, and the debility resulting from a protracted exposure to these numerous sources of disease requires a very complete change and a very long course of sanitary and medicinal treatment for its removal; hence, one of the remarkable features in the transparent ulcer is the very lengthened period during which it will remain stationary, and unaltered in its size and other characters. The local treatment is comparatively unimportant, and should be of a very mild character. It has been suggested that the salts of lead, in solution, should not be employed in ulcers of the cornea, on account of the tendency to a permanent deposit upon the surface. I have observed this on more than one occasion, and it is quite in harmony with what occurs when the acetate of lead is powdered over granular lids; and as there is no counteracting advantage to be gained by the use of lead lotion, it is better to abstain from it altogether where ulceration exists. Some cooling, unirritating collyrium, such as rose water or elder-flower water, or a weak solution of vinegar, is the best local application. Where the case is very protracted, and the surface of the ulcer becomes irritable, it is sometimes advantageous to touch the surface lightly with the fine point of the nitrate of silver. I much prefer this to the employment of a solution of lunar caustic, which irritates the conjunctiva, without acting so directly upon the ulcer, and often seriously aggravates the case. It is particularly important, in the glassy ulcer, to apprise the patient or his friends that an opacity of the cornea must be expected, otherwise the symptoms are so mild, and the evidence of breach of surface so faintly appreciable to uneducated vision, that discredit may easily attach to the surgeon who is in attendance, and, as the ulcer begins to fill up, an impression will be gained that the case is retrograding, at the very time when it is drawing to an auspicious close.

In cases of ulcer with a vascular membrane and organized deposit upon its surface, which is usually somewhat raised above the level of the rest of the cornea, and in which red vessels may be seen travelling to supply it, the treatment is difficult. We have here new and organized deposit to combat with; diseased action seems to have established itself, and (if I may use the expression) to have taken up its abode in the part, and this very much increases its power of resisting all

remedial means, and its constant proneness to relapse or return after apparent subsidence. I have had an opportunity of observing several of these cases at the Ophthalmic Hospital; they usually apply after this condition has existed for a considerable time, and when a variety of remedial means have been exhausted upon them. They generally occur in young females about the age of puberty, or a little anterior to this, although they are also found in young strumous children. I believe them to be due, in the first instance, to a disturbed, altered, or arrested function of some important organ in a feeble or strumous diathesis, aggravated by an active depleting plan of treatment, or by the injudicious and protracted use of strong local stimuli, particularly the nitrate of silver. The obvious inference is, that every available means must be taken to bring about and maintain the normal function of any organ that may be at fault. This is particularly necessary as regards menstruation; at the same time I may add that I have frequently found the local disease, when thus established and organized, continuing in full force long after the constitutional vice to which it owed its origin has passed away. As regards local treatment, I have usually found stimuli of all kinds injurious; soothing applications are the best; sometimes one or two leeches, applied about every other day for a week or two, are of use, particularly where the vessels are rather numerous and full, and the inflammation is in a sub-acute stage; but that which has appeared to me to be of the most marked and essential service in this form of disease are *issues* inserted into the temple, and kept there for many months. I usually employ a small pea for this purpose, which must be changed daily. I am aware that some high authorities, and Mr. Tyrrell amongst others, sweepingly condemn the use of issues in all cases of eye disease, on the grounds of the severity of the treatment, its general inutilty, and the subsequent deformity. I admit that these are objections in slight and transient cases; but they lose their force when we are considering a severe, obstinate, protracted disease, liable to relapse, detrimental to sight, and effectually preventing all use of the organ while it remains unsubdued. It is for such cases that I would reserve the employment of issues. A morbid action has become established in the eye, and requires a prolonged discharge in its immediate vicinity, gradually to divert it from its original seat, and to weaken the tendency to relapse—at least, such is the explanation I am disposed to offer; but, whether correct or not, I entertain no doubt whatever of the power and value of the remedy. I have succeeded in completely and permanently curing several cases of this kind by the prolonged use of issues when they had baffled all other means for many months and even years, and when the constant irritation and necessary confinement were casting a gloom upon what would otherwise be the brightest period of life. It seems to me that, to obtain emancipation from such a condition, a small scar on the temple is but a slight penalty, and one most freely paid by the sufferer.

When the cicatrizing process is going on favourably, the only practical point we have to consider has reference to the opacity remaining in the cornea; this is often a cause of great anxiety on the part of the patient, on account both of the deformity and the dimness of vision resulting from it, and its removal is frequently sought. I believe time will effect much in this respect, as we find, in other scars, a gradual contractile process goes on for a considerable time, and the surrounding deposit entirely passes away, so that a very decided diminution of the opacity ultimately takes place. Much confidence is expressed by some in the action of various local stimuli in promoting the absorption of such opacities; thus, solutions of the nitrate of silver, of zinc, of iodide of potash, calomel, and various other stimuli, are each of them in high favour with different observers. It is extremely difficult to estimate the value, either positive or relative, of any of these means, when we know the natural tendency is towards a gradual absorbent action. It is impossible to avoid the conclusion that, whilst it may be the result of our application; it may also be irrespective of, or it may even be in spite of, the means employed; and, I must confess to some degree of scepticism in regard to the efficacy of any of these stimuli in removing opacities; at the same time I am quite aware that in practice it is often necessary to employ something of the kind. I generally use a solution of the iodide of potash—five grains to an ounce of distilled water—dropped in three times a day. It does not cause pain, and its action is gently stimulating and absorbent. I think the nitrate of silver objectionable, because I have seen several cases in which its prolonged use has caused a permanent stain in the conjunctiva. If we do employ it, care must be taken not to continue it for any lengthened period; certainly not above five or six weeks at a time.

Having now described those affections of the cornea which I believe to be secondary, and dependent upon an inflammatory condition in the conjunctival membrane—viz., vascular opacities and ulcers, I pass on to the consideration of those morbid changes which are peculiar to the cornea.

The term "corneitis" may, I think, with propriety and convenience, be applied to the disease I am now about to describe, as it seems to be restricted in its effects to that structure, and to have all the characteristics, both in its history and symptoms, of a specific malady, although we shall find that it differs considerably in the degree and in the extent, or rather depth, to which the layers of the cornea are implicated. It is a disease of childhood and youth, very rarely, if ever, occurring after the middle period of life; it usually develops in a few days, with little or no pain, and with scarcely any evidence of conjunctival inflammation, the slight pink discoloration seeming rather to be due to injection of the sclerotic vessels—probably those vessels which are described as being specially dedicated to the nutrition of the proper layers of the cornea. That which usually first attracts the notice of the patient is dimness of sight in one eye, accompanied sometimes with a slight dull, aching pain. On examining the eye, the cornea presents an uniform pale-white opacity, with just sufficient transparency remaining to enable you to see the iris and pupil, but not with such clearness as to show with certainty its colour and condition, although its activity may usually be made out. The surface of the cornea, when closely inspected, is found to be finely granulated; in fact, the state I am now describing is perhaps best represented by comparing the altered cornea to a thin layer of finely-granulated ground glass. The opacity is very generally and equally diffused over the cornea, though usually rather thicker towards the centre, but it is difficult to determine the extent to which it penetrates and involves its layers, and in this respect there is probably considerable diversity. The pain is very slight, sometimes altogether wanting, and there is no intolerance of light. One eye is almost invariably affected in the first instance, and the disease may be limited to the eye first involved; but more commonly, when it has existed some time, and is subsiding or has just passed away, the second becomes similarly affected, and runs through the same phases. This is by far the most common form of corneitis that we meet with: its cause is involved in much obscurity. I have endeavoured in vain to attach it to some special abnormal condition of system, or to exposure to cold or some other noxious influence. Some high authorities always apply the term "strumous" to this morbid change, and I do not deny that it may be complicated with this diathesis, like most forms of ophthalmic disease; but I have frequently seen it in young persons from the country, about the period of puberty, and a little past that age, having every appearance of health, and in whom I could not find the faintest trace of struma, and therefore, where it is observable, I regard it rather as an accidental concomitant than as a cause. This disease is rather to be regarded as an example of altered or diseased nutrition, which in a less delicate structure would scarcely be noticed, but which becomes important by disturbing the function and changing the appearance of a transparent tissue.

With regard to treatment, I have taken some pains to investigate and follow out the natural history of this disease in a great number of cases, and I have come to the conclusion that it has its definite period of development, that it remains in full force for a given time, varying from two to four or five months, and then gradually passes away, clearing from the circumference like a vanishing cloud, and ultimately leaving no trace behind, the cornea resuming its perfect original transparency, although the central opacity will often linger in a patchy state for some time after the circumference of the cornea has become quite transparent. I was first led to take this view of corneitis, from finding that, whilst I was pursuing various kinds of treatment, and at the very time that the disease appeared to be subsiding most favourably under the plan I was adopting, the same train of symptoms would suddenly manifest themselves in the second eye, would pass through the same stages, and subside in about the same time as the eye primarily affected; thus, for example, on several occasions, I instituted a mild mercurial course, in accordance with the recommendation of Mr. Tyrrell, and during the time that there was direct evidence of mercurial action in the system, I have seen the disease commence and run through its course in the second eye. I have also observed the opacity remain quite stationary during the prolonged influence of this medicine, and only subside when the period seemed to have arrived at which the disease had run its course; then, by degrees, I became in a great measure expectant, and with a result quite as satisfactory as when I used

active constitutional and local means, and probably much more so. If my view of this disease be correct, and I have taken much pains to test it by repeated and close observation, it follows that the management of this affection is very simple. All local stimuli are quite useless, and may be injurious, by giving pain, by increasing vascularity, and by irritating a membrane previously scarcely involved in the disease. Some very mild collyrium must be used, and, if any constitutional error can be detected, it must be treated with suitable medicine. Thus children affected with this disease are often weak and strumous, and improve in health under the influence of steel, cod-liver oil, or iodine; at the adult period, tonics seem most frequently to be indicated, and any suitable treatment may indirectly tend to shorten the period of duration of the disease by restoring the system to a condition of health; beyond this point art can effect nothing, and the rest must be left to the "*vis medicatrix naturæ*"—that constant friend of our profession on many trying occasions, and who, in this form of disease, I have rarely if ever known to fail. Hence it follows that a most important part of our treatment, and one that we may very confidently and advantageously administer, (provided only that we make a correct diagnosis,) is the assurance of a complete restoration of sight; for in the milder form of the disease that I am now describing, I can scarcely call to mind a single exception to this favourable result.

It occasionally happens that corneitis manifests itself under another and severer form, and, though probably differing only in degree, spreads deeper, produces more formidable results, and more seriously interferes with vision, from the circumstance that it usually involves the second eye before the first has recovered its transparency. The corneal opacity, instead of being uniform, exhibits one or more patches of a reddish-brown colour, not on the surface, but between the layers of the cornea. On a superficial view these appear like small masses of extravasated blood; but if carefully examined, and especially when subjected to the dissecting power of a magnifying glass, they are found to be made up to a great extent of minute vessels, and to be in fact masses of highly-organized lymph. Sometimes there is only one small patch of this kind, the remainder of the cornea presenting the appearance of ground glass, as in the milder form I have before described; but I have seen some few cases in which the entire cornea has presented one nearly uniform organized mass. In this severe type of corneitis there is much more evidence of increased vascularity; the conjunctiva is considerably injected; the deeper vessels are involved; there is both lachrymation and some intolerance of light; patients also complain of a dull, aching pain. It is very important not to confound this disease with the vascular opacity of the cornea, which I have described in a former lecture as the result of a villous state of the conjunctiva in strumous subjects. In this latter, the vessels lie chiefly on the surface of the cornea, and are distinctly and individually visible with the naked eye; whereas in vascular corneitis, as I term the disease I am now dwelling upon, vessels can only be seen through the aid of a magnifying glass, and the reddish-brown patch is placed between the corneal layers. This may, perhaps, appear to some rather a minute and unnecessary division of diseases that closely resemble each other; yet, inasmuch as they differ most essentially in their origin and cause, in the effects they produce, in their prognosis and treatment—in fact, in their entire history, it is surely very desirable clearly to mark the distinctions between the two; and I am the more anxious to insist upon this point, because it is quite evident that even so acute and accurate an observer as the late Mr. Tyrrell has confused the two diseases together, as will be seen by his placing Cases 33 and 34 in his work under the head of "Corneitis" instead of "Vascular Opacity," to which they evidently belong.

The disease I am now describing never produces ulceration of the cornea, or abscess between its layers, nor does it ever soften the texture so as to cause it to yield, and thus to increase its convexity; its effects are limited to the general dulness of the cornea, and the organized deposit between its layers. This disease is exceedingly distressing to the patient, on account of the great dimness of sight that it produces usually invading the second eye before the first has recovered its transparency, and thus producing a condition very closely bordering on temporary blindness. It may occur in children, but the worst forms of it that I have seen have been in adults between thirty and forty years of age. It is very protracted in its duration, and, as far as I have seen, resists every kind of treatment, but ultimately gets quite well, when perhaps every plan has been tried and abandoned in despair; and much unmerited and unexpected credit may be gained by the fortunate individual who happens to be in attendance at the time of its subsidence.

Such cases would give an easy triumph to the administrator of infinitesimal doses if he should be working his miracles at that phase of the disease. Such cases form an interesting section of pathology, not only on account of some special points attached to them individually, but because they are highly suggestive and instructive. They show how important it is to know the natural history of disease in estimating the power and value of any plan of treatment, and how rationally the success of various means that exert no real effect upon the system is explained. So protracted and apparently hopeless are some of these cases, that it requires great confidence in our pathology, and a large amount of uniform experience, to venture to promise a favourable issue in such a case; nevertheless, I have attended some very severe forms of the disease in which patients have remained dark for many months, where, upon the strength of former observations, and without any reliance upon any method of treatment, and in the face of so considerable a morbid change in the cornea that it seemed to an ordinary observer as if it could never resume its transparency, I have reiterated my conviction that sight would be restored, and I have never known my opinion prove incorrect. And this promise has been the one slender hope to which the poor, half-blind sufferer has held on through many a dark and anxious month, and it has required no little faith on the part both of the patient and the surgeon, before that faith has been once more merged in restored sight.

I have usually observed that the antecedents of this disease have been of such a character as to enfeeble the system,—considerable labour, great mental anxiety, some constant drain upon the system, improper and insufficient food; but I have not been able to trace any direct or immediate effect upon the disease by the removal of these unfavourable circumstances. After what I have stated, but little remains to be said on the subject of treatment; the great point is not to be induced to do too much by the severity of the disease. I am quite convinced, after repeated trials, that mercury will not absorb the organized deposit; I therefore now carefully abstain from its use. I simply limit myself to the employment of such means as will restore power to the system, but without anticipating any favourable result to the disease, except indirectly, hoping merely that it may run its course more speedily when the system is in a healthy condition. Local means are useless, and if stimulating, injurious; if I made an exception in favour of any kind of local treatment, it would be the use of issues. I think I have observed that the disease has been favourably modified by their employment, and that the eye, secondarily affected, has run a less severe and protracted course than the first. It is quite in unison with all my observations, that issues act favourably wherever new organized deposit exists in the cornea, but to produce any effect, they must be persevered in for a considerable time. There is one point that I feel pretty confident about in reference to this very formidable disease, which is, that unlike most affections of the eye, it very rarely returns.

## ON THE USE AND ABUSE OF POTASSA FUSA AND POTASSA CUM CALCE

### IN THE TREATMENT OF UTERINE DISEASE.

By J. HENRY BENNET, M.D.,

PHYSICIAN-ACCOUNTEUR TO THE ROYAL FREE HOSPITAL, &c.

It is now more than nine years since I introduced to the profession, in the first edition of my work on "Uterine Inflammation," potassa fusa and potassa cum calce as valuable remedies in the treatment of some chronic and intractable forms of uterine inflammation. Since then these agents have been adopted by many practitioners at home and abroad, a fact of which I have ample evidence in my own practice, as I am constantly consulted by patients in whom this means of treatment has been resorted to. In some of these cases I have found that the caustic potash has been incautiously used, so that lesions of the vagina and partial occlusions of the cervical canal have been produced, notwithstanding the careful and minute directions which I have given for its employment. As I cannot but consider myself to a certain extent responsible for the use of a remedy which I have introduced in this country, I am anxious, in the present paper, to lay down precisely the rules which ought to regulate practitioners when they resort to so powerful an agent.

Potassa cum calce was first used in the treatment of chronic inflammation of the cervix uteri by M. Gendrin, the en-

lightened physician to La Pitié, Paris. It was in the year 1837, seventeen years ago, that I first saw him employ it, and during the three years that I subsequently passed with him, as his pupil and *interne*, we were scarcely ever without cases in process of treatment by this means. Subsequent experience confirmed the results at which I then arrived, and led me to the conviction which I have repeatedly expressed, a conviction that time only strengthens—that the application of caustic potash to the treatment of chronic and intractable uterine inflammation is one of the most valuable contributions to uterine pathology that has been made in modern times. At the same time, I am perfectly ready to admit, that in unskilled hands it is a dangerous remedy—a double-edged sword, which indiscreetly used may do positive harm, instead of good. But we must recollect that the same remark equally applies to all surgical means of treating disease in every part of the human economy. What havoc may not the bistoury, the principal agent of the operating surgeon's ministry, produce, unless guided by skill and prudence? The fact of a powerful remedy being, in unskilled hands, a dangerous one is no more a reason why it should be discarded than is the same fact a reason why the health or death-giving instruments of the surgeon should be anathematized. It is, however, a reason why the rules that ought to guide us in the use of this remedy should be carefully elucidated and scrupulously followed. It is owing no doubt to the unvarying care with which I use the caustic potash that I am able to say that, after seventeen years' extensive experience of the remedy, I have not yet had a single serious accident.

M. Gendrin always used a paste made of the potassa cum calce of the Pharmacopœia, moistened with alcohol. I myself followed his example for some years; but, finding its application difficult, I first tried the caustic potash of Dr. Filhos, and then potassa fusa alone. The former consists of two parts of lime and one of potash, run into lead moulds. I found these tubes convenient for use, but not sufficiently active; whilst the pure caustic potash in cylinders was so very deliquescent, that it required a troublesome process of packing the surrounding parts with cotton steeped in vinegar, to limit the action of the caustic to the region on which it was intended to act. This induced me to try if I could not obtain cylinders of potassa cum calce in a more active form: two parts of potash to one of lime, and in a free state—that is, not cased in tubes. In this attempt, with Mr. Squirr's assistance, I completely succeeded, by casting it in iron moulds, and obtained sticks of potassa cum calce nearly as active as the pure potassa fusa, and yet having the non-deliquescent properties of the potassa cum calce paste. These cylinders, which are made of various sizes, render the application of this powerful remedy as easy as that of the nitrate of silver, no previous packing of the parts being necessary, and the action being limited to the region to which it is applied. Thus has been attained a great desideratum—a valuable agent, which could previously only be used with some trouble and risk, having been rendered manageable and safe.

The conditions of local uterine disease in which I consider that potassa cum calce may be used with advantage, are—intractable chronic inflammation, or inflammatory ulceration of the mucous membrane covering the cervix uteri, or lining the cervical canal; chronic inflammatory hypertrophy of the cervix; and lastly, chronic inflammation of the body of the uterus, in which form of disease I merely apply the caustic potash to the cervix, to produce a derivative issue.

The principles on which I have endeavoured to found the local treatment of the chronic inflammatory conditions which are so common about the cervix, its os and cavity, are those which ought to regulate the treatment of all inflammatory diseases of the skin and mucous membrane in explorable regions. If the acute or subacute stage of inflammation still exists, emollient applications and local depletion are indicated; if that stage has passed, and the disease appears in the chronic form, astringents should be used to directly modify the diseased capillary circulation, and they failing to restore healthy action, caustics should be resorted to, especially if ulceration be present, with a view to substitute healthy, reparative, manageable inflammation for that in existence, which is unhealthy, destructive, and unmanageable. This appears to me the true *modus operandi* of caustics and of the actual cautery, whenever they are used in the treatment of morbid inflammatory conditions, from a minute ulcer of the cornea to hospital gangrene. The inflammation set up by nature to throw off the eschar artificially produced, is naturally of a healthy, reparative kind, which admits of being controlled and brought to a favourable termination, *provided the stimulation be sufficiently powerful*. Thence it is that if one caustic, the nitrate of silver, for instance, does not produce the desired effect, another more

powerful, such as the acid nitrate of mercury, may; and that failing, a still more powerful agent, such as the actual cautery or caustic potash, will certainly succeed. This law—for law it may be termed—deserves a more general recognition in surgery than it has hitherto obtained, for it points out the true mode of treatment in many intractable forms of chronic inflammatory disease. It will be observed that I speak of the actual cautery in the same paragraph with caustic potash, the *rationale* of the action of these agents being identically the same.

In chronic ulcerative disease, the caustic should only be lightly applied, the object being merely to renew the surface of the sore. In chronic hypertrophy, the object in view is rather different. It is not the destruction of the hypertrophied tissues which is desired, but the production of a state of increased vitality, bordering on inflammation, in these tissues, under the influence of which they soften and melt. This result is produced by the mere formation and elimination of an eschar the size of a shilling, and a few lines in depth. It is certainly quite unnecessary to destroy any amount of diseased tissue, as has been recommended since I first introduced this plan of treatment; such a course greatly aggravates the importance and risk of the operative process, without any equivalent benefit accruing to the patient. If the softening and melting of the indurated and hypertrophied cervix does not take place entirely on the first application, it may be repeated several times on different regions of the cervix, at intervals of four or six weeks. Although a more tedious mode of proceeding, I am convinced that it is a more safe one than the extensive destruction at one sitting of the indurated tissues of the cervix uteri, advised by some of those who have adopted the practice.

It is, however, more especially when the caustic cylinder is passed into the cervical canal, in the treatment of inflammation of that region, that caution is necessary, and that I find it is not always observed. Inflammatory ulceration not unfrequently passes into the lower part of the cervical canal, and proves intractable to all ordinary means. Chronic inflammation of the mucous membrane and follicles lining the cervical canal, may obstinately resist all means of treatment, owing, probably, to many of the diseased follicles being concealed between the sulci, or depressions existing between the rugæ of the arbor vitæ. In both these forms of cervical disease, I have recommended, as a last resource, a small potassa cum calci cylinder to be applied inside the os, to the diseased surface. Its action being more decided and deeper than that of iodine, the nitrate of silver, &c., it probably produces more energetic vital reaction, and reaches, moreover, the concealed follicles, which the other milder caustics do not. It is certain that I occasionally meet with cases of chronic inflammation of the cervical canal, otherwise incurable, both in my hands and in those of other physicians who have preceded me, which I am able to cure by this means, and this alone. I must, however, be allowed to repeat, that in my practice the use of potassi cum calce, especially in the treatment of inflammation of the cervical canal, is altogether an *ultima ratio*—a last resource, and not an ordinary mode of treatment. I may here also remark, that the views expounded by Dr. Tilt, in his paper recently read before the Medical Society of London, respecting the pathology of this form of uterine inflammation, do not essentially differ from those which I published many years ago, with the exception of what has reference to the uterine granulations described by M. Recamier, which I am not prepared to admit as of common occurrence. I must also add, that I quite agree with Dr. Tilt as to the value of the tincture of iodine applied locally to the cervical canal, in the milder forms of chronic inflammation. I have used it extensively for some years, and with great benefit.

(To be concluded.)

## ON A NEW METHOD OF INJECTING SUBJECTS FOR ANATOMICAL PURPOSES.

By EDWARD LUND, M.D., M.R.C.S.E., & L.S.A.

DEMONSTRATOR OF ANATOMY AT THE MANCHESTER ROYAL SCHOOL OF  
MEDICINE AND SURGERY.

(Concluded from page 661, vol. i. 1854.)

I WILL now explain the mode in which I conduct an ordinary injection, and the instruments I employ for the purpose; and, although these may appear to be rather complicated, the practical observer will readily admit that, in matters of experiment, no hints can be deemed superfluous, and no details too minute,

by which certainty in the result of any process may be secured. The object which I have kept in view in every method I have adopted for injecting an entire subject has always been, to leave the aorta and other vessels as nearly as possible in their natural position after the operation, that they may still serve for the purpose of study or demonstration. If we suppose, then, that the injection is to be effected through the aorta at its commencement, and that the subject is lying upon the back, an incision is to be made with a scalpel, exactly in the median line, through the integuments and other coverings over the front of the sternum, along the whole length of that bone, and for about half the extent of the ensiform cartilage. The sternum is then sawn through in the same direction, care being taken that no injury is done to the parts beneath, and particularly that towards the end of the section the point of the saw does not lacerate the left innominate vein immediately behind the upper edge of the bone. When the bone has been divided, the operator must separate its two portions for about half or three-quarters of an inch with a stout wedge or chisel, and then the instrument shown in Figs. 3 and 4, which might

be styled a "sternum separator or tractor," may be used to complete the separation. This instrument, of which I employ a pair, I have found to be of great assistance in performing all injections in the neighbourhood of the heart. It is composed of a bar of steel, about three-fourths of an inch in diameter, and eight inches in length, upon one end of which a right, and upon the other a left-handed, screw is formed, with a small space between them just in the middle of the bar. Two collars of brass or copper, *rr*, travel upon these screws, having the flattened hooks, *pp*, attached to them, so as to have their backs in contact when the instrument is closed, as in Fig. 3. By turning the handle, the hooks can be carried with very great force equally away from the centre of the bar. If this is done after one of the separators has been inserted into each end of the incision through the sternum, the opening into the chest can be dilated to any extent, and the curved ends of the hooks will keep them in position, and prevent their being accidentally displaced. After the pieces of the sternum have been thus drawn apart for about an inch, it will be necessary to complete the division of the ensiform cartilage with a scalpel, but yet to avoid cutting either the peritoneum or the upper surface of the diaphragm, where this from any cause is very convex, and then to divide the fibres of the inter-clavicular ligament, which crosses the sternum at the upper part, and which is generally very strong. In this way, by a few turns of the screws, sufficient space can be obtained to expose freely the uncovered portion of the pericardium, and the free edge of the right lung, and all this can be done very rapidly after a little practice. The pericardium may now be laid open by an incision of about four inches in length, and any fluid between it and the heart removed with a sponge. The next step is to secure the aorta, and to pass a ligature round it before incising it, so as to introduce the aorta-pipe, the precise form of which is seen in Fig. 7, and in Figs. 1 and 2, *t*, as it appears when connected with the apparatus.

The "aorta-hook," shown in Fig. 5, will be found to be very

FIG. 5

useful for this purpose. In its construction it resembles a form of double tenaculum, frequently used by surgeons, only it is much longer and stronger, and the ends are blunt and smooth, except on the inside, where they are made rough to hold the ligature. This hook, closed by means of its slide, is to be passed round the aorta, just above the base of the heart, from the right to the left side, and gently pressed through the areolar tissue found between the roots of the aorta and the pulmonary artery. When it has appeared at this spot, it may be moved about, so as to separate the two vessels, the slide then drawn up, and the blades of the tenaculum will open by their elasticity. One end of a piece of strong string, about fourteen inches in length, is now to be placed between them, the slide pushed down to grasp it firmly, and the instrument carefully removed so as to bring with it a portion of the string. The blades of the hook being once more expanded, the string will be left beneath and around the vessel. If the ends of the string be now tied together, it will form a coil around the aorta, by which that vessel may be raised a little out of its position, so as to be more easily opened. This is to be done by a small incision across the vessel, about an inch from the heart, joined by a second, continued longitudinally towards and nearly as far as the semilunar valves. If this incision is found not to be large enough to admit the nozzle of the aorta-pipe, it must be enlarged in an upward direction. Any coagula which may have formed in this part of the aorta, or in the large vessels passing off from it, must be carefully removed, and then the injection-pipe may be introduced.

I have always found that unless the heart is forcibly pulled forward, and a good deal disturbed from its natural situation, it is very difficult to tie a ligature around an injection-pipe in the aorta, so evenly and securely that it shall not permit the escape of an aqueous solution of any preservative salts which may be thrown into the vessels, even if it were tight enough to retain the wax or other injection, that I have now recourse to a process of twisting or torsion for making the ligature secure. I take the instrument seen in Fig. 6, which

FIG. 6  
HALF-SIZE

is made of iron or steel, and pass the lower cross-bar into the loop of string already around the aorta, in such a way that the string shall rest in the notches, *vv*, at the two extremities. This being done, and the knot in the string being placed somewhere on the bar, I commence to twist it round, drawing it, at the same time, away slightly from the tube, until, by a continuance of this twisting action, the string begins to press the artery upon the injection-pipe, just behind the shoulder of

the nozzle. When the compression appears to be sufficient, I fix the upright portion of the instrument, by passing one of the holes in it over a blunt pin or peg placed on the side of the injection-pipe, and in this way it is held quite steadily, as is seen in Fig. 7. This simple method of applying a ligature,

which I have found to be most effectual, can be performed without displacing the heart, and it is very similar in principle to the string and stick tourniquet, often referred to by surgeons as a ready mode of compressing the large artery of a limb when other more complicated instruments are not at hand. To prevent, however, the artery being cut through, by the pressure between the string and the side of the pipe being excessive, I place a small collar of vulcanized india-rubber, *x*, just behind the projection of the nozzle of each injection-pipe, and this assists in making the joining perfectly water-tight before too much compression has been employed. In this way I have frequently secured an aorta, so much diseased by atheromatous deposit, that it would most certainly have been injured if the ligature had been applied in the ordinary manner.

As soon as the injection-pipe has been fixed safely in the aorta, as appears in Fig. 7, one-half of it projecting out of the chest, the tap, *g*, is to be shut off, and the tubes and reservoirs being already charged with the injection and the hot water, the subject may be carried towards and placed beneath the apparatus. If the apartment in which the injections are to be performed is not very lofty, it will be necessary to lay the subject upon the floor, which is the plan I adopt; or it may be put upon a table of convenient height; but in either case the head must be kept steady by blocks, the upper extremities must be drawn slightly away from the sides of the chest, the palms of the hands being turned upwards and the fingers straightened, and the lower extremities must be separated for a short distance, so as to give to the line of the femoral arteries nearly the same direction as is known to be the course of the common iliacs. The subject must also be moved about, or the apparatus raised or depressed as required, until the union-joint, *f*, can be easily screwed up to make the whole line of tubes and taps continuous, as in the lower part of Figs. 1 and 2. The two taps, *d* and *g*, being closed, it would now only be necessary to open them to complete the operation, if there were not another point of importance which must first be attended to in order to ensure success. I have already said that the lower part of the apparatus should always be made as hot as possible, to keep the injection, whether of wax or gelatine, in a state of perfect fluidity up to the moment of its delivery into the aorta, so that no impediment may arise to its easy transmission through the other arteries. In my earlier experiments, I noticed that much of the heat of the injection was absorbed while it travelled through the union-joints, the taps, and the injection-pipe, all of which are made of brass. To obviate this difficulty, I have placed around the pipe, just below the tap, *g*, Fig. 7, a very shallow brass dish or cup, *w*, which is also represented in the other figures.

At this stage of the proceedings I pour into this cup rather less than a fluid drachm of spirits of wine, and set light to it; and by the time it is all consumed it will have imparted just sufficient warmth to the metal work (along which the heat is quickly conducted) as to leave every part of it of a suitable temperature. I now open carefully the higher of the two taps, *d*, and afterwards the tap, *g*, which I do rather more slowly; and the injection thus liberated, being urged onward by the pressure of the vertical column above, flows in an equal and steady stream into the aorta, and from it through every artery in the body. With such amazing rapidity is this effected, that I have frequently observed it almost at the same instant, and always within fifteen or twenty seconds, distending the superficial temporal, the radial, and the femoral arteries; its passage is nearly instantaneous, and the injection reaches the most distant arteries with its fluidity but very slightly diminished.

It is in this way that a hot distending-injection, of a composition very similar to that usually employed for the purpose, can be driven along the arteries without the body having been previously warmed by any artificial means. After a few minutes, during which time the pressure may be safely continued, the taps are closed, the union-joint, *f*, disconnected, and the subject removed, to make room for a second, if another is to be injected on the same occasion; for the relative capacity between the injection-cylinder and the reservoir which supplies it is so proportioned, that three subjects might be injected in succession without any important alteration in the altitude of the vertical column, which, measured from the bottom of the reservoir to the pipe in the artery, would be still of the required height.

I have often noticed that the quantity of injection which can thus be thrown into the arteries of different subjects does not vary so much with the height or size of the body as might have been supposed, for it seems to depend more upon the degree of distensibility in the walls of the bloodvessels themselves, which being in some cases more rigid and inelastic than in others, do not yield so easily to the force with which the injection is impelled, and the quantity received is therefore less. The exact amount will be found to average from about a pint and a half to two pints—very rarely more than the latter quantity. As to the class or calibre of the arteries injected by this process, since the material made use of is that which the older anatomists called the coarse injection, so it does not generally penetrate beyond the third or fourth division of each vessel. The small arteries of the brain are always beautifully injected, as are also the ophthalmic arteries and their divisions; while those of the small intestines, and, in the upper extremities, the palmar arches, with most of the digital branches, are generally well distended. In the lower extremities, and more particularly in the feet, the success of the process is not so constant, partly, doubtless, on account of the great distance of these parts from the heart, and partly on account of the unfavourable angle at which the foot is placed, in reference to the leg, in the position of the subject, which must interfere with the rapid progress of the injection. The anterior and posterior tibial arteries, however, are always injected, and generally, although not invariably, the external and internal plantars.

Where, for the purpose of demonstrating with precision the situation of the large vessels within the chest, the injection is to be introduced through the abdominal aorta, the best plan is to cut through the common integuments and the linea alba for about three inches above and below the umbilicus, and the abdominal cavity being fairly exposed, to seek for that part of the aorta which is between its bifurcation into the common iliac vessels and the origin of the inferior mesenteric artery. A ligature being passed beneath the vessel with the hook, it must be divided transversely for about four-fifths of its circumference, and the T-shaped injection-pipe seen in fig. 8

fairly secured in it by the process I have described. When this has been connected with the apparatus, the stream of the

injection can be made to flow with equal force in an upward and downward direction, and we obtain a perfect distension of all the arteries of the lower parts of the body, although now it will be those of the upper limbs, and especially the hands, which will be only partially filled.

Yet this method possesses many advantages, where we are anxious to exhibit the relative position of the vessels at the base of the heart under equal degrees of distension. It is obvious, however, that by this mode of injecting, the anterior walls of the abdomen will be greatly damaged, and the parts on the posterior wall, where there is often much difficulty in dislodging the aorta, so as to apply the ligature at the spot I have indicated, will be much displaced. Indeed the inferior mesenteric artery is given off so very irregularly, in reference to the iliac bifurcation, that I have lately employed, with much advantage, in this injection, a three-way injection-pipe. It is made somewhat triped in form—one branch is for the aorta, just above the bifurcation, and the two others, each about one-half its diameter, are for the common iliac arteries. When this has been securely fixed, which can be done much more easily than the T-shaped pipe, (by dividing the aorta into three pieces at its bifurcation,) every artery in the body, except the middle sacral artery, can be penetrated by the injection.

In this plan of injecting the arteries of the chest through the abdomen, it is very necessary that the aortic valves should be sound, or otherwise the cavities of the heart will become unnaturally distended by the injection. This state of the valves can only be inferred by considering the cause of death, and the probable age of the subject; it should rarely be attempted where the subject is very old. The proximity of the ascending portion of the aorta to the back of the sternum is well illustrated in an injection of the arteries of the chest made in this manner, for the most projecting part of the arch of that vessel, if it has been fully distended, will be found slightly flattened in front by pressure against the bone.

I have always had reason to be well satisfied, for all the ordinary purposes of demonstration, with the extent to which these injections have been carried; and I believe, if it were possible to make them much more minute, this would rather tend to confuse than assist the anatomist in his first examinations of the arrangement of the arteries, by complicating the appearance of a system the divisions and communications of which are so intricate as to demand a slow and patient inspection, first of their main trunks, and afterwards of their smaller branches, before the true value of their mutual relations can be fairly estimated. During the last two or three years, I have injected the subjects which have been dissected under my superintendence with some preservative fluid, before distending the arteries with the wax or gelatine injection; and this I have always done with the same apparatus, using only the central portion, without any hot water. To show how much of the liquid part of the blood must be absorbed by the substance of the various tissues and the smaller vessels in the body, at the time of death, I may remark, that in thus preserving the subjects I can readily pass into the arteries very nearly six pints of an aqueous saline solution, by allowing it to flow in slowly, and yet in less than four days afterwards these vessels will, by mere physical contraction, have so completely emptied themselves, and driven all the fluid into the capillaries and the veins, that they will admit the usual quantity of a distending injection. These facts seem to indicate that the aggregate capacity of the vascular tubes in the body is far greater than the volume of the blood itself by which they are occupied in the living state.

With respect to the best composition for preservative fluids for anatomical purposes, as well as the materials best suited for distending injections, either for the arteries, the veins, or any of the vessels, these are subjects of so much interest and importance to the practical anatomist that, as they have engaged my attention for some time past, I purpose very shortly to lay the results of my experiments before the profession; for I have always considered that much of the distaste and disinclination which students exhibit towards engaging in a laborious and persevering course of dissections, is chiefly due to the little attention which has been directed to these two points, and especially to the absence of any systematic plan of preserving the subjects for dissection, so as to prevent the injury to health necessarily resulting from inhaling the gaseous products of animal decomposition, and to retain as long as possible the colour and natural consistence of the parts which must be examined. For assuredly there can be no inseparable connexion between a careful study of recent dissections and that aptitude for enduring, without repugnance, an amount of decomposition and putrefaction which, under other

circumstances, would certainly excite disgust; and yet to prosecute anatomical researches under such conditions, until very lately, has been the rule rather than the exception.

No efforts, however trivial they may at first appear, can, in my opinion, be held to be unimportant which have a tendency to cultivate in the minds of students a love for the study of anatomy, so as to lead them to pursue it originally, and to rest their anatomical knowledge upon the sure and sound basis of personal observation, rather than to content themselves with information derived, as it were, second-hand—from mere verbal descriptions, from models, plates, and other sources, deeply instructive as these most certainly are, when rightly used.

The plan of injecting subjects for dissection, which I have thus endeavoured to describe, has now been practised by me in more than sixty instances, taken indiscriminately, and always with so much success, that I consider it is a means of advancing the study of practical anatomy, to which those who, like myself, are daily occupied in its elucidation, will doubtless attach some importance. I think that the same method may be carried out more extensively in minute injections, and in observations in comparative anatomy, so as partly to supersede the use of the syringe, which, although possibly a very useful instrument in the hands of some anatomists, requires long experience before we learn what amount of pressure must be exerted in each experiment, and how far this may be sustained with safety. This knowledge can only be acquired by constant practice, and even then the results are far from satisfactory. The difficulty of course in applying the principle of the pressure of a vertical column of fluid to comparative injections, is the absence of data to guide us as to the height of the column and the pressure required.

I hope, in a future communication, to be able to explain how this obstacle may be overcome, and to show how very fine injections, of even microscopic minuteness, may be obtained with much greater certainty of result than that which has heretofore attended the prosecution of these researches.

Manchester, 1854.

## ON DIABETES, AND ITS RELATION TO BRAIN AFFECTIONS.

By RICHARD H. GOOLDEN, M.D.,

PHYSICIAN TO ST. THOMAS'S HOSPITAL, &c., LONDON.

(Concluded from p. 668., vol. I. 1854.)

THE cases that I have quoted are much too few in number to justify any inference that purgatives and blisters are to be considered as specific, if, indeed, such a treatment can ever be so considered. But I wish it to be regarded rather as an indication of treatment which we must reconcile with the observations of other physicians; for the results of their experience are entitled to so much respect, and especially when the name of Prout is included amongst them, that I would rather doubt the accuracy of my own observations, or consider my results as accidental, than admit that their facts are not as important and as accurate as my own. But we must make a distinction between opinions founded on actual observations, and those which are merely expressions of opinion founded upon conjectural hypothesis, as where Dr. Prout speaks of bloodletting and purgatives. The former he admits as applicable in cases of recent occurrence of an acute character, as inapplicable to protracted cases occurring in old subjects, and where debility is excessive, and he recommends frequent local bleedings from the epigastric region. But he states that bloodletting can be better borne, even in cases where debility exists, than could have been expected; and this is doubtless the result of his own observation. But when speaking of purgatives, it is not difficult to perceive that his opinions are referable to his notions of the origin of the disease. He begins by acknowledging that others have found great benefit by their active use. He states that he has found no permanent benefit from their use, though they diminish the quantity of urine by diverting the fluid of the body into other channels; and then he recommends the occasional use of castor-oil or rhubarb, and carefully to abstain from the use of all saline purgatives, with the exception of phosphate of soda. Now, this is opposed to my direct observations, for my cases show directly, that under the influence of sulphate of magnesia and calomel the flow of urine has diminished more than could be accounted for by the purgative effect; and, also, that the diminished secretion was of a lower specific gravity. And, in accordance with my results, Dr. Prout, in a note, observes,

that he has known a patient labouring under this disease in its worst form drink largely of the Leamington waters without increasing the quantity of his urine, and even with some apparent improvement in his health. This he endeavours to explain away, but the admission shows the truthfulness of the great man; but it also shows how readily even he could be induced to admit that most dangerous, though common, proverb, that the exception proves the rule; as if the laws of Nature could ever admit of deviation, except by miracle.

But I should do no service to medicine if I were to leave an impression that saline and mercurial purges, and blisters to the head or cervical spine, are to be adopted indiscriminately as a cure for diabetes; or that all cases are capable of cure; but, having traced certain cases to cerebral irritation, and having treated the patients with reference to such irritation with results more or less satisfactory, there still remains a wide field for future investigation to diagnose the cause of such irritation, and I shall not be surprised to find that many cases are altogether beyond remedy; but that many are to be relieved and cured by the most opposite plans of treatment. We may find that the cerebral irritation itself may only be secondary, and tonics, astringents, stimulants, and opiates, may all be employed successfully when we know how and when to employ them.

But I mentioned that saccharine urine, without diuresis, is a very common affection, and is so constantly associated with cerebral disease, that few cases of chorea and epilepsy in young people occur without betraying a trace of sugar in the urine. Dr. Venables observed that it was a very common affection amongst scrofulous children of the poor; and I believe there are few cases where children suffer much from teething that sugar may not be found in the urine. I have satisfied myself on this point, and would only again remind the experimenter, that the decomposed urea, in the shape of carbonate of ammonia, is very apt to interfere with Trommer's copper test, without the proper precautions; but what becomes of these cases, and of the sugar? Just anything that relieves the brain, and restores the general health, will restore the secretion to a healthy condition. We do not find it necessary, in such cases, to blister, bleed, and purge.

Severe cases of neuralgia, especially tic douloureux and sciatica, are often, but not universally, attended with saccharine urine, which disappears when the nervous affection is relieved. The exceptions appear to me to be those cases where the neuralgia is of gouty or rheumatic origin; but of this I am not sure; yet I hope, on still further observation, to form a more certain opinion. I have seen it disappear under the use of quinine in large doses, and opium; and my friend, Dr. Dundas Thomson, to whom I am indebted for much valuable assistance in the laboratory, and for many suggestions, tells me that he has only lately been consulted by a young lady suffering severely from facial neuralgia. The urine, as he suspected, betrayed a considerable amount of sugar; and that both the pain and the saccharine condition of the urine suddenly disappeared after the application of a blister, not to the head, but to the face. This case is important for illustration, because it is given upon the authority of so eminent a practical chemist, and whose analysis would satisfy any one that he could not be mistaken as to the presence of sugar.

A girl, aged thirteen years, No. 23, in Anne's ward, was admitted under my treatment. She was suffering from very severe and constant headache, and likewise from pains in various parts of the body, but without any swelling or tenderness on pressure. There was great disinclination to make any exertion; the pulse 98—120; face flushed; skin not perspiring; she passed about twenty-four ounces of urine, clear, and of the colour of Madeira wine; it was alkaline, and specific gravity 1.024. The report was, that the urine contained no sugar; but observing it to be very ammoniacal immediately after it was voided, I boiled it in the laboratory with a small quantity of pure soda, and then I found an abundant precipitate of orange-yellow on the application of the copper test, and Dr. Thomson confirmed my analysis. A blister to the back part of the head completely removed the headache, the urine ceased to be ammoniacal, and no more sugar was to be detected in it. This patient is the subject of incipient phthisis, and there is much probability that the brain was suffering from strumous congestion, which the blister relieved.

But however much benefit we may observe to have been derived from blisters in the above-mentioned cases, we cannot expect that chronic cases are to be managed so easily, but rather that constitutional remedies, steadily persevered in, will be more likely to give beneficial results, and that such benefit is to be obtained, I may give an example, which I must take from my private case-book, because, although hos-

pital cases have the advantage of public reference, it is rarely that their early history is either so accurate or trustworthy as those which are presented to us in that class of life where every little ailment in the childhood of a future heir is recorded as a matter of family history.

E. H. W—, aged thirteen, was brought to me by his parents, in July of last year, for an opinion as to his general treatment and management when with a private tutor in the country. He was suffering from fits of epilepsy, which occurred several times daily, at uncertain periods. Whatever he might be engaged in, he would suddenly lose his consciousness, mutter some words, and remain in a fixed position for several minutes, but never fell down nor suffered any convulsions. He greatly disliked any allusion being made to his fits, which he called being dizzy; he recollected nothing that occurred during the fit, but awoke from them as one waking out of a sleep, and for some time afterwards would feel very cold and sleepy, and, when practicable, would lie down for about half an hour. His family history showed a tendency to cerebral excitement, his father and paternal uncles and aunts being all remarkable for talent; one aunt died suddenly from apoplexy at an early age, and another is the subject of catalepsy and somnambulism, and one of the disciples of Mesmer. His early childhood was quite healthy, and his first illness commenced when three years and a half old, when he was found to be in a fit at seven o'clock in the morning, as he was about to be taken out of bed. He was in a state of stupor, slightly convulsed, and much sickness supervened.

The fits recurred for several times at intervals of several weeks, and after one attack, he suffered from pain in the hip, and lameness, which lasted for some time. The bowels were obstinately constive, and he took large doses of calomel and the strongest forms of purgatives to act upon him, under the direction of Mr. Bickersteth, Sir Arnold Knight, and Dr. James Johnson. The head was leached, and blisters applied to his neck. He recovered from these attacks, had the whooping-cough, and a slight attack of small-pox and measles, without any return, and remained without them for a year afterwards, but he always had recourse to purgative medicines, of which croton-oil, colocynth, and calomel formed the principal parts. About three years ago the fits returned, but were altogether altered in character. The usual purgative was discontinued, and ox-gall given as an aperient, but the fits became more and more frequent, till at last they were repeated several times daily.

Besides the fits, I observed a slight tendency to chorea. He walked as though he was not quite certain of his balance, and in turning round, appeared to find some difficulty in doing so, which gave him an appearance of awkwardness. The secretions from the bowels were constive but healthy, and he would go for several days without an evacuation, but always suffered a severe fit after the bowels were opened; his appetite was very good, and tongue clean; head hot; the urine was specific gravity 1.022, very turbid, with an excess of lithate of ammonia acid, and contained a very decided quantity of sugar. It was filtered, boiled in an evaporating dish, with a slight excess of pure soda, again filtered, and then a few drops of solution of sulphate of copper dropped into a small quantity placed in a test-tube, boiled again gently in a sand-bath, and the blue precipitate soon became ochre-yellow. This experiment was repeated several times with the same result, at intervals of two or three days apart.

August 13.—I prescribed half a drachm of sulphate of magnesia twice a day in infusion of roses, and two grains of mercury with chalk every night. This opened the bowels freely, and the urine became clear, but with no diminution of specific gravity or sugar, the quantity made being from fourteen to twenty ounces, but the fits became more frequent in proportion to the action of the bowels.

August 20.—I then discontinued the purgatives, and let the bowels act as they would, which appeared to be every other day. He laid in or on the bed, with evaporating lotions to his head, and was kept on milk and farinaceous food for a week, at the end of which time the urine sank in specific gravity to 1.014, the quantity remaining about the same, and all trace of sugar disappeared, the blue precipitate becoming dark-brown on boiling, instead of yellow. The fits now occurred only once a day.

27th.—His diet was improved; meat once a day, and some bitter table-beer allowed, which agreed well with him, and some iron wine prescribed.

He continued this plan till December, occasionally passing a day without a fit, the urine never betraying a trace of sugar; but observing that he always had a severe fit when the bowels had been moved, I ordered him some decoction of

the bark of the root of the pomegranate three times a day, and one drachm of cod-liver oil twice; and he took some of Twinberrow's Baël jam instead of butter, with an occasional dose of mercury with chalk, two grains, and rhubarb, three grains, when he required aperient medicine. From that time the improvement was very perceptible. The fits became so slight that he did not lose consciousness, but felt merely a sensation of giddiness, everything appearing out of place, and moving; and by a strong effort he could often control them, nor did he require to lie down and sleep afterwards. They soon occurred only on alternate days, and now he often passes an entire week without them.

Now the inference I would draw from these few observations is, that the seat of disease is some portion of the brain, and that the disease itself may be primary, as when produced by injury; or secondary, as when it originates in some strumous or other cachectic condition of the system;—that the sugar is the product of the secondary, and not of the primary assimilative functions; assuming Dr. Prout's definition—viz., "The primary assimilating processes comprise all the processes of digestion, and all the intermediate processes up to sanguinification; while the secondary assimilating processes comprise the processes by which the different textures of which the living body consists are first formed from the blood, and afterwards redissolved and removed from the system." The appetite and thirst are to be considered as natural indications, to be gratified with prudence, and more with reference to the wants of the system than any fear of increasing either the sugar or the amount of fluid.

Even if the amount of fluid be diminished, and the quantity of sugar in the excretions lessened, through inanition, the advantage is not equivalent (except in particular inflammatory cases) to the effect produced by consequent loss of nutrition to the system; and no possible advantage is gained by a diminution of morbid secretion under such circumstances, since such diminution is no index of improvement. All remedies should have reference to the morbid action taking place in the brain, and not in the stomach, liver, or any other digestive organ, although we may require to act upon the brain through their agency.

The idea of diabetes being a cerebral disease is so recent that we have no record of autopsies in which cerebral lesion has been observed or looked for; and I have never had an opportunity of examining a brain with that object of search. This subject in future will form an important object for the pathological anatomist.

## A Mirror

### OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

*Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.*—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

#### ST. BARTHOLOMEW'S HOSPITAL.

COMPOUND FRACTURE OF THE RADIUS NEAR THE ELBOW; DISLOCATION OF BOTH BONES BACKWARDS, AND SIMPLE FRACTURE OF THE RADIUS NEAR THE WRIST; RECOVERY, WITH AN ANCHYLOSED ELBOW-JOINT.

(Under the care of Mr. STANLEY.)

OUR attention has lately been attracted by certain cases of compound fracture about the elbow-joint, in which the surgeons determined to watch the reparative efforts of nature, and refrain from amputating. Several of these cases have now been brought to a favourable conclusion, and we now just briefly allude to them, so as to illustrate by facts the fair prospects which may accompany adherence to the principles of conservative surgery.

It would, however, be extremely erroneous to attempt saving the arm in all cases of severely fractured elbow-joint; it requires, on the contrary, a good deal of judgment and discrimination to make a proper choice; for it has happened that patients who have sustained the injury just mentioned have perished from

abundant suppuration, exhaustion, or erysipelas, when the idea of performing amputation, as a last resource, could no longer be entertained, owing to the advanced state of debility into which the patients had fallen. We apprehend that much will depend on the previous state of health of the individual, on his habits, and the extent of the injury sustained; but in the calculations to be made by the surgeon, he should always bear in mind that, in the wards of an hospital, suppurating wounds are liable to casualties the chance of which is not so great in private practice. Again, notice should be taken of the patient's calling, so as to regulate the angle of the arm in the most advantageous manner.

Mr. Stanley succeeded, in the case lately under his care, in discharging the patient with an anchylosed arm, flexed at about a right angle; and it is very likely that the man will be able to use the limb to a certain extent. When we saw this man in the wards, about six months before Mr. Stanley showed him to the pupils in the theatre, with a stiff elbow, and in tolerable health, we purposed to follow all the phases of the case, to watch the pathological phenomena, and learn to what extent the life of the patient was hazarded by the conservative course which was adopted. We had, at the same time, our fears that perhaps the ablation of the limb would, nevertheless, have to take place. But we are happy to say that the event has been far more favourable than might at first have been supposed. The suppuration was of course abundant, and the patient had to be well supported; but by carefully attending to position, by the early opening of abscesses, by a proper succession of soothing, stimulating, and astringent applications; by attention, first to the inflammatory fever, and then to the subsequent debility, cicatrization, and eventual anchylosis, were obtained in the space of about six months.

Mr. Stanley stated, on the 6th of May last, when explaining the case in the operating theatre, that the arm was anchylosed at an angle a little more open than a right one, but that that form of limb was especially desirable in persons who want it as contributing to the symmetry of the frame, rather than affording effective assistance in manual labour. It would be easily understood, that the relations of the muscles of the forearm must be considerably altered, and that therefore the movements of the hand and fingers had become imperfect; but the arm, defective as it was, could be but looked upon as a gain, seeing how near the patient had been of losing it altogether.

This case reminds us forcibly of another, pretty well of the same kind, which was treated by Mr. Cock, at Guy's Hospital, and to which we have before alluded. In this instance the fracture of all the bones entering into the formation of the elbow-joint was so severe, that Mr. Cock had to remove, piecemeal, almost the whole of the articular processes. The usual series of pathological events to be expected in such a case did not fail to occur—intense inflammatory fever, profuse suppuration, abscess, irritative fever, debility, &c.—but, by attention to those means best calculated to combat these several complications, which means are well-known to our readers, Mr. Cock succeeded, after a twelvemonth's patience and unremitting care for the man's comforts, in saving the arm. Many fragments of necrosed bone had to be removed in the course of the treatment, and it should be especially noticed, that on several occasions the state of the patient was such that the propriety of amputation was discussed. We heard Mr. Cock say, that he judged the amount of risk incurred to be somewhat disproportionate with the value of the arm, and that much discrimination was necessary to decide which cases might be treated on the conservative plan.

With reference to this question, we may mention a case, now under the care of Mr. Curling, at the London Hospital. The patient met with a severe compound fracture in the vicinity of the elbow-joint, and the succession of abscesses was so considerable that he became much debilitated. His state was indeed so critical, that when the question of amputation was discussed in consultation, this extreme measure was not determined upon, as it was doubtful whether the patient had sufficient strength to bear it. A change for the better soon afterwards took place, and Mr. Curling had the satisfaction of perceiving that, according to all appearances, there was a very fair prospect of recovery.

From all these cases it becomes manifest that the adoption of summary proceedings or conservative means, in instances of the kind just stated, is a matter requiring the application of all the judgment and discerning powers of the surgeon; for he has on one side the loss of a limb, and on the other the loss of life, and it is for him to weigh all the circumstances of the case, and to make a choice.

We should not omit to add that wounds connected with fractures of the elbow-joint sometimes assume a most unfavour-

able aspect, which may be but temporary, and not connected with as much danger as might at first appear. After excision of the joint (an operation which has some points of resemblance with compound fracture at the elbow) we have seen the parts presenting such a gaping wound, the suppuration so profuse, the abscesses so numerous, the irritative fever so intense, that amputation seemed the only means of preventing a fatal issue. But matters often change suddenly, and a rapid improvement takes place.

Mr. Birkett has now a little patient under his care, at Guy's Hospital, whose elbow-joint he excised some weeks ago; the boy is now doing well; but about a fortnight after the operation the wound was in so inactive a condition, the suppuration so considerable, the oedema so extensive, and the child so weak, that fears were entertained, and amputation spoken of. But here again the means employed were successful, and, combined with the influence of youth, they worked a favourable change, and the patient is now in a very fair way of recovery.

No one can foresee the complications which may baffle our best efforts, either in cases of fractured elbow-joint, or excision of the articulation. The rule is, that cases of the latter kind do not involve much risk of life, and no apprehensions are felt by the surgeon on this head; and yet, the other day, after excision was performed by Mr. Fergusson, at King's College Hospital, on a very favourable subject, the latter died soon afterwards of pleuritis, an event which certainly could not have been foretold, and which had no connexion with the operation itself.

The practical inference to be drawn from the consideration of the cases to which we have rapidly alluded, may, perhaps, be, that conservative measures in cases of fracture about the elbow should be adopted only after mature reflection, and the careful weighing of all the circumstances of the case; and that the prognosis of excision of the same joint, though it need not be particularly doubtful, should ever be guarded.

#### LONDON HOSPITAL.

EPITHELIAL CANCER INVADING THE PINNA OF THE EAR,  
AFTER THE FALL OF A HORN, DEVELOPED UPON A WART  
IN THE SAME LOCALITY.

(Under the care of Mr. JOHN ADAMS.)

THE museums of this and other countries contain preparations showing that a hair follicle in man may become endowed with a peculiar abnormal energy, which will give rise to the growth of a horny product, very little different, both in appearance and intimate structure, from the horns which form natural appendages with some of the lower animals. These strange deviations from ordinary nutrition, are remarkable for the vigour of growth and reproduction which they display, ablation being seemingly an encouragement to repopulation. We have seen one or two cases of epithelial cancer of the lips, connected with very hard, horny, and conical projections, the size being in general diminutive, but so large and twisted a horn as was noticed in Mr. Adams' patient, we had never met with.

As regards the lip, we may just state that there is a boatman about Gravesend-pier, who is conspicuous from the growth of a horn, about one inch and a half long, which has sprung from the lower lip. He is known to pare down this unseemly appendage once about every two months, but it invariably grows again, though it does not appear to produce much discomfort, as the man does not wish to have it removed. Whether the ablation of this unusual cuticular process would be followed by a troublesome ulcer in this boatman, or not, is difficult to say; but it is clear that such an occurrence is possible, if we judge from the succession of phenomena mentioned in the heading of this case.

Mr. Adams' patient is a tall, thin man, sixty-six years of age, who follows the occupation of schoolmaster, and was admitted May 30th, 1854. He bears a very healthy aspect, has generally been free from disease, and is not aware of any tumour or growth of any kind having ever invaded any part of his frame. Two years before admission, the patient noticed on the pinna of the left ear a small wart, which gave him no pain, and to which he did not pay much attention. This cuticular growth continued, however, to increase in size, the development remaining very gradual until about seven months prior to admission, when it became rapidly larger, and gave the patient a little pain. A sore now formed at the root of the growth, and the man was advised to poultice the part. At this period the wart had taken a considerable horny development, and had reached the form and size represented in the subjoined engraving.

a, Portion which was attached to the ear.

By dint of poulticing, the connexions of the horn with the ulcerated surface became weakened, the former fell off, and has ever since been carefully preserved by the patient. The ulcer continued, however, to spread; it soon invaded the whole length of the pinna and lobule of the ear, and the man, becoming alarmed, applied to the hospital.

When admitted, it was ascertained that the ulceration was of a malignant kind, and Mr. Adams, looking upon the disease as epithelial cancer, considered that the safest course was the removal of the diseased portions of the ear.

On the 9th of June, a little more than a week after admission, the operation was performed, the posterior half of the whole length of the pinna, and a portion of the lobule, being removed with the knife. The patient progressed remarkably well; in three weeks the part was cicatrized, and the man allowed to return into the country.

It would appear that in this case the cancerous ulceration was excited by the presence of the horn, which latter had taken full development when the malignant disease became manifest. Now it is the very reverse which has been observed in other cases; for the horny growths generally spring from an already existing cancerous ulceration, whilst it would seem that, in Mr. Adams' case, the epithelial cancer followed upon the disease of the follicle, which gave rise to the growth of the horn. It must, however, be confessed that the malignant ulceration appeared soon after the horn had reached a pretty large size, and it remains doubtful whether the "epithelial structures," which, by their super-position, produced the abnormal growth, were originally of a cancerous nature. According to Mr. Paget, the development is cancerous from the beginning; this author says, in his work, "On Tumours," p. 420:—"The same general plan of construction exists in all (epithelial cancer growths)—namely, a certain portion of the skin, or mucous membrane, is infiltrated with epithelial cancer structures; on this, as on a base more or less elevated and imbedded, the papillae, variously changed in shape, size, and grouping, are also cancerous; their natural structures, if we except their bloodvessels, which appear enlarged, are replaced by epithelial cancer-cells. And herein is the essential distinction between a simple and common warty or papillary growth, and a cancerous one, or warty cancer. In the former, the papillae retain their natural structures; however much they may be multiplied, or changed in shape and size, they are either merely hypertrophied, or are infiltrated with organized inflammatory products; however abundant the epidermis or epithelium may be, it only covers and ensheathes them. But in the warty cancer, the papillae are themselves cancerous; more or less of their natural shape, or of the manner of their increase, may be traced; but their natural structures are replaced by cancer structures; the cells, like those of the epithelium, lie not only over, but within them." According to the mode of development described by Mr. Paget, "the papillae (in the present case) retained their natural structure, (for a time,) though multiplied and changed in shape and size," while the papillae became themselves cancerous at a later period—viz., when the cancerous ulceration became apparent at the base of the horn. As we stated above, the patient will not part with this striking illustration of irregular nutrition, and the memory of the case will be perpetuated in the museum of the hospital by a wax model.

CHOLERA IN FRANCE.—The cholera is making serious ravages in several parts of France, and especially in the departments of the Aube and the Upper Marne. There are no less than fifteen departments affected by the disease. In the Upper Marne the number of sick is so great, that the government have been obliged to send several medical practitioners and eight assistants from Paris.

**Medical Societies.****EPIDEMIOLOGICAL SOCIETY.**

MONDAY, JULY 3, 1854.

**ON THE USE OF VEGETABLE AND MINERAL ACIDS, IN THE TREATMENT, PROPHYLACTIC AND REMEDIAL, OF EPIDEMIC DISORDERS OF THE BOWELS.**

BY J. H. TUCKER, ESQ.

THE author commenced by alluding to the remarkable, but well-established fact, that in 1849 the cider districts of Herefordshire, Somersetshire, and part of Devonshire, were, to a great extent, exempt from the epidemic ravages of cholera, while the disease was raging around. Upon further inquiry it was ascertained that this exemption was confined a good deal to those individuals who drank cider as a common beverage, and that those who partook of malt liquor occasionally suffered. He also remarked that, in some parts of France and in Normandy, more particularly where cider is the common beverage, cholera is seldom known to exist; and further, that Switzerland was reported to have been free from its visitation.

Having adduced these and other facts in proof of the prophylactic power of cider, the author expressed his opinion that other vegetable acids would be found of service, such as lemon-juice, orange-juice, and sour wines made from grapes, or even from gooseberries. And as it would be found impossible to supply the whole of London with a sufficient quantity of pure cyder, Mr. Tucker suggested that *vinegar* might be found a useful substitute in case of another outbreak of cholera, provided that it could be obtained in a state of purity. In confirmation of his view of the sanative and medicinal virtues of vinegar, the author quoted Hippocrates, who (*de natura morborum*) "employed white vinegar medicinally"—Plutarch and Livy, who refer to the use of vinegar by Hannibal, in his passage over the Alps, when he is said to have "softened the rocks with fire and vinegar," an operation which the author facetiously regarded as rather metaphorical than chemical, as the vinegar, swallowed by the troops, probably sustained their strength, and thus in effect softened the asperities of their rough way. The author also quoted from Roman history the story that "Scipio Africanus is said to have gained a great battle with a few skins of vinegar," the troops refusing to march until the general had obtained a supply. Caesar was also reported to mention in his Commentaries the supply of vinegar to the troops; and Mr. Tucker remarked that the drink of the Romans in all their campaigns was vinegar and water, and, sustained by that beverage, they conquered the world. Modern authors, (Sir John Pringle, Sir Gilbert Blane, and others) were also quoted in proof of the antiseptic and medicinal qualities of vinegar. The author then proceeded to show that acid drinks were not only preventive, but remedial in epidemic disorders of the bowels. Cases were related, in which not only persons were exempt from attacks of cholera raging around them, who drank large draughts of cider, but a case of severe cholera was also related, which yielded to the diluted juice of sour apples. The efficacy of the *Mineral Acids*, especially the sulphuric, in diarrhoea, and especially in choleric diarrhoea, was also advocated by reference to numerous facts and authorities. He also referred to some established facts connected with the spread of epidemic dysentery in the army, showing the efficacy of vegetable acids in that disease.

In conclusion, Mr. Tucker suggested a necessary caution relative to the use of the wretched and unwholesome substitute for vinegar commonly sold in the London shops.

The discussion which followed the reading of the paper, elicited many facts in confirmation of the author's views; and, as to the efficacy of sulphuric acid largely diluted with water, in choleric diarrhoea, there was not a dissentient voice.

**NORTH LONDON MEDICAL SOCIETY.**

WEDNESDAY, JUNE 14, 1854.—DR. HARE, VICE-PRESIDENT, in the Chair.

Dr. RAWLINS was elected a Fellow.

Mr. BURFORD NORMAN related a

**CASE OF SPURIOUS CATARACT, IN A WOMAN.**

A false membrane, the result of old inflammation, was attached to the iris, which caused much disfigurement. This he removed by depressing the membrane with a needle.

Dr. GREENHALGH related a

**CASE OF DYSMENORRHEA IN A YOUNG WOMAN,**

who had suffered much ever since menstruation commenced. On examination the uterus was found to be enlarged. The treatment was commenced by the application of leeches to the os uteri, and afterwards by the introduction of a sound, the consequent irritation being treated with warm baths and alternative doses of mercury. Her recovery was rapid, and Dr. Greenhalgh has subsequently seen her with a fine healthy child. He thought that in many of these cases, dilatation of the womb was very advantageous.

Dr. PRETTY related a

**CASE OF SUDDEN DEATH FROM THYMIC ASTHMA, IN A CHILD FIVE MONTHS OLD.**

The thymus gland weighed twelve drachms.

Dr. HARE and Mr. ADAMS spoke to the frequency of laryngismus stridulus during the last six or eight months.

**Reviews and Notices of Books.**

*Remarks on the Hill Diarrhoea and Dysentery, with Brief Notices of some of the Himalayan Sanatoria.* By ALEXANDER GRANT, Esq., Surgeon to the Governor-General of India, and Secretary to the Medical Board, Calcutta, Bishop's College Press. 1853.

WE greet with especial satisfaction the appearance of every report from our brethren in tropical regions bearing on the most important branch of medicine—that of the prevention of disease. In the preface to the sixth edition of the work "On the Influence of Tropical Climates on European Constitutions," Mr. J. R. Martin exhorts his brethren "seriously to examine the influence of general tropical climate, of locality, and of season, on European health. Such objects are in reality of more value than volumes of cases or details of routine practice; their careful investigation will confer permanent benefits on the public service, and, sooner or later, derive honour to themselves, difficult, if not impossible, to be obtained in any other way." This was truly said, and we are glad to perceive that Mr. Grant is one of those who has justly derived both honour and profit from his careful devotion to the important question of sanitary information.

Hitherto we have heard nothing but unqualified praises of the hill ranges of tropical climates, and for the information that we shall not find in them an unmixed good we are indebted to Mr. Grant. Mr. Grant does not by any means propose to depreciate or to throw discredit on the hill climates; far otherwise is his intention, and, if we mistake not, the inquiry he has so worthily begun in the East must extend to all our intertropical possessions: such is the value of discussion in matters of science. Investigations of this nature possess extreme interest and value, for they point directly to the selection of the most approved localities in the mountains, to the proper structural arrangements there for barracks and hospitals, &c. &c.

We lately observed that all the medical and surgical skill exercised in a thousand battles—such as that of Waterloo, for instance—could not bring to the British soldier a tithe of the beneficence which would result to him from the simple act of being removed from the plains to the mountains of our intertropical possessions. We believe this to be strictly true, and that it must be by sanitary measures of precaution and of prevention, rather than by means of cure, great as these last confessedly are, that our soldiers and seamen may be maintained in health and vigour. It is stated on authority that the noble Highland regiment, the 92nd, "lost more officers and men in four months from the climate of Jamaica than by the hand of the enemy in an active warfare of twenty-two years, in the progress of which it was engaged twenty-six times." So lamentable a sacrifice will no longer be witnessed in Jamaica, for permanent arrangements have been made for our soldiers in its mountains by order of the late Lord Metcalfe.

Mr. Grant proposes to describe "an inveterate form of

bowel complaint, which is well known to be endemic, in the important and near-lying group of hill sanatoria, including Kussowlie, Sabathoo, Simla, and the new station of Dughai. There are few topics of greater importance than the sanitary advantages of these localities, and the study of their essential and accidental atmospheric agencies, especially with reference to the prevalence of this particular class of diseases, which occasions nearly all the mortality, and has been in some instances a serious source of inefficiency and loss to regiments for years after they have returned to the plains."

After an excellent sketch of the topography of the several hill sanatoria, and after furnishing valuable statistical information as to their sanitary importance, the author details the causes, symptoms, pathology, and treatment of the hill diarrhoea and dysentery. We can here do no more than call the attention of the profession to this interesting and important subject, as affecting the welfare of British troops in all hot countries. The article will be found in the first volume of the "Indian Annals of Medical Science"—a journal containing much valuable matter, both scientific and practical, and conducted by very able officers of the medical department of the Indian army. We understand that Mr. Grant has the merit of originating this periodical, and that he proposes to publish in it his further observations and experience of the hill climates of India. Questions of the highest consequence are involved in this investigation, such as the influences of previous sanitary condition of corps sent to the hills, the influence of previous fevers, and other diseases, contracted in the plains, &c. It would be interesting also to determine the relative influences of relative elevations, so as to exhibit the results of residence in the lower as well as the higher ranges. All this, and much more, we hope to learn from future investigations; meanwhile, we would call attention to what Mr. Grant states on the prevalence of "land scurvy" in the mountain stations—a serious complication in the bowel complaints of those climates. "Many of the cases," he says, "were only marked by a cachectic state of the body, by soreness of the tongue and oesophagus, or by pains in the thighs and long bones." He justly adds, that scurvy may "by no means always depend on the want of vegetables, and it may pervade the system without any manifest affection of the guma."

We hope, in conclusion, that we may again meet Mr. Grant in a field of inquiry in which he is sure to be well received by his professional brethren.

*Orr's Circle of the Sciences: a Series of Treatises on the Principles of Science, with their Application to Practical Pursuits. Vol. I. Organic Nature. 8vo, pp. 393. London: Orr and Co.*

In this age of cheap literature "Orr's Circle" deserves to hold no inferior place. This volume contains three distinct treatises—one on the "Principles of Physiology," by the Editor; the "Structure of the Skeleton and the Teeth," by Professor Owen; and on "Varieties of the Human Race," by Dr. R. C. Latham. It is scarcely necessary to say that these subjects are handled with the usual ability of their respective authors. The work is profusely illustrated.

## Contemporary Medical Literature.

### BED-SORES IN THE INSANE.

In the prevention of this form of asthenic gangrene, it is of the utmost importance to remove the patient from the bed, and place him in a well-stuffed easy-chair for at least a few hours every day, as long as it is possible to support him in a sitting posture. The importance of hardening the skin should not be forgotten. I have for many years been in the habit of using, for this purpose, a mixture of equal parts of tincture of kino and goulard extract. They form, by union, a semi-fluid compound, composed mainly of tannate of lead. This mixture formed the basis of an old nostrum for sore nipples, and is an

excellent means for hardening the skin. It also agrees well with gangrenous sores, and is a powerful antiseptic, so that it may still be used to harden the surrounding skin when the gangrene has actually taken place. Of local applications to gangrenous parts little need be said; chlorine washes, chloride of zinc, yeast poultices, &c., may be applied with advantage; oxide of zinc is used by Mr. Ley, and alcohol by Dr. Kirkman. Peat charcoal has been used, but is dirty and unsatisfactory. The free application of powdered cinchona bark often assists the separation of a slough. The best local protection afterwards is afforded by a soap plaster spread upon chamois leather. When asthenic gangrene takes place on the insteps, feet, or even, as it sometimes does, on the fingers, it is a good practice to envelop the extremities in cotton wool.—Dr. BUCKNILL in *Asylum Journal*.

### CHARCOAL AS A DISINFECTANT.

Mr. Turnbull, about nine months ago, placed the bodies of two dogs in a wooden box, on a layer of charcoal-powder of a few inches in depth, and covered them over with a quantity of the same material. Though the box was quite open, and kept in his laboratory, no effluvia was ever perceptible; and on examining the bodies of the animals at the end of six months, scarcely anything remained of them, except their bones. Mr. Turnbull sent me a portion of the charcoal-powder which had been most closely in contact with the bodies of the dogs. I submitted it for examination to one of my pupils, Mr. Turner, who found it contained comparatively little ammonia, not a trace of sulphuretted hydrogen, but very appreciable quantities of nitric and sulphuric acids, with acid phosphate of lime. Mr. Turner subsequently, about three months ago, buried two rats in about two inches of charcoal-powder, and a few days afterwards the body of a full-grown cat was similarly treated. Though the bodies of these animals are now in a highly putrid state, not the slightest odour is perceptible in the laboratory. From this short statement of facts, the utility of charcoal-powder as a means of preventing noxious effluvia from churchyards, and from dead bodies in other situations, such as on board ship, is sufficiently evident. Covering a churchyard to the depth of two or three inches with coarsely-powdered charcoal would effectually prevent any putrid exhalations ever finding their way into the atmosphere. Charcoal-powder also greatly favours the rapid decomposition of the dead bodies with which it is in contact, so that in the course of six or eight months little is left except the bones.—Dr. STENHOUSE, in *Pharmaceutical Journal*.

### VACCINATION WITHOUT PUNCTURES.

M. Morlane, of Metz, has just made public that he produced three regular vaccine pustules, which appeared on the fourth day, by merely placing some vaccine matter on the arms of two children, and rubbing up and down the spot with the sharp end of an ivory paper knife. He was led to try the experiment from recollecting the fact of young girls taking the cow-pox on the fingers used for milking.—*Dublin Med. Press*.

### EMETICS IN TOOTHACHE.

M. Cæsar Frederico, of Ghent, has directed attention to a variety of toothache which is indicative of a disordered state of the stomach, and which he has succeeded in relieving by the administration of ipecacuanha in emetic doses. He has seen this treatment succeed where everything else had failed, and where even the removal of the diseased tooth produced no effect.—*Op. cit.*

### DYSENTERY.

It would seem that an attack of dysentery does not exert an unfavourable influence on the organism, that patients are not rendered thereby prone to any particular disease, but, on the other hand, enjoy good health. It would also seem that patients are not liable to a repetition of the disease.

I would not be understood as presenting these inferences in the light of established truths. The number of observations is too small to warrant deductions which shall represent fixed laws of the disease. But, as already remarked, it is difficult to account for the facts on the hypothesis of their being due to mere coincidence; and I repeat that the facts point to the existence of laws which remain to be settled by further investigation. We are at least justified in concluding, from the data before us, that deterioration of the health subsequent to dysentery is not the general rule, and that an attack does not lead to any increased susceptibility to the cause or causes of the disease.—*New York Journal of Medicine*.

# THE LANCET.

LONDON: SATURDAY, JULY 15, 1954.

As the inquest on the body of the late ALFRED RICHARDSON is again adjourned, we shall defer the summary of the evidence until the conclusion of the investigation. The extraordinary facts that were revealed at the last sitting of the Court, have caused the utmost amount of indignation in the profession, and intense excitement amongst the public. That an infamous conspiracy has existed is no longer a matter of doubt.

THERE is no principle of legislation which requires more consummate wisdom and tact in the carrying out, than the principle of compulsion. It is surely not necessary to say that, if this principle of legislation be of difficult operation anywhere, it is almost impossible here. The stubbornness of Englishmen is such, that they will incontinently resist any measure, however demonstrably beneficial, if it comes to them supported by force. No one, at least no person of average information, disputes the benefits of vaccination. The discovery of JENNER has been hailed in every civilized land as the greatest boon that science ever gave to mankind. Paternal governments, that is, governments accustomed to do everything for the people over which they rule, have long since made vaccination compulsory. Acting according to the spirit of paternal governments, they have no doubt done wisely. The result is, that vaccination is more universal and more effectually performed abroad than in the land of JENNER. The philanthropist, the legislator, may regret that this should be so. The proposition that vaccination is a blessing which it is folly to reject, is sound. The proposition that vaccination ought, therefore, to be enforced under penalties, will not be so readily admitted. Philanthropists and legislators are apt to be somewhat dogmatic and absolute; but they cannot safely disregard the prejudices of the classes whom they would benefit; nor can they hope to give effect to their best meant measures if they associate those measures with the idea of compulsion. Setting aside for the moment the consideration of the obstacles opposed to the extension of vaccination by the constitutional waywardness of our countrymen, let us consider whether the poorer classes have not some show of reason at least on their side.

There is a belief—it may be denounced as a prejudice, but it is not the less a deeply-rooted conviction, and one not confined to the poor or the ignorant—that if the vaccine disease may be transmitted by inoculation, other diseases less beneficial may be propagated in the same manner, and by the same operation. Many a parent of high and low degree dates constitutional disease in her offspring to vaccination with “bad matter.” Who shall say that this etiological conclusion is always false? But whether false or not, it deserves to be considered how far it is prudent or just to compel a mother to take her infant to a particular station, on a particular day, to be vaccinated by a surgeon selected for her by others, who may be a stranger to her, with lymph taken from a child of whose health she may not be satisfied. Shall we be surprised if the mother’s feelings often revolt against all this? She may be foolish, she may be ignorant, she may be doing an injury to her child by not

taking it to be vaccinated, but it is not by compulsion or by penalties that she will be convinced of her error. Besides, the confidence that springs up between the patient and the medical practitioner is a feeling that ought to be respected. On the one hand, the patient will readily submit her child to her ordinary medical attendant; and, on the other hand, it is very like reckoning without one’s host to expect to carry out a scheme of universal vaccination unless the hearty goodwill and co-operation of the entire body of the profession be secured. These reasons were strongly felt and immediately urged by ourselves when the Bill of last year was before Parliament. We saw very plainly that a measure framed in disregard of these considerations would not only fail, but would rather increase the prejudices of the poor against vaccination. A very few months have proved the truth of our arguments. There is now a wide-spread feeling of opposition amongst the poor, and a feeling of irritation amongst the profession. The difficulties experienced have led to the necessity of amending the Act.

In addition to the sources of difficulty we have mentioned, other difficulties of administration have been strongly felt. There could scarcely be a graver error than to associate a national measure of this kind in any way with the Boards of Guardians. These Boards are so rarely animated by a liberal spirit or comprehensive views—they have so many other duties to perform, some necessarily of an unpopular character, and their relations with the medical profession have given that body so little satisfaction—that it argued little practical knowledge of business to entrust the most important share of the execution of the Act to them. Such a step was, moreover, a perfectly unnecessary complication. The appointment of vaccination stations might have been left to the Registrar-General; and the appointment of medical officers might surely have been made independently of the Guardians. The power of interference given to the Boards of Guardians has certainly done much to render the Act unpopular and nugatory. Yet this association is to be retained. It is wished to make vaccination universal; it is sought to enforce it by penalties where an enlightened judgment is wanting; and the method determined upon is to enforce it by the agency of authorities who are too often looked upon with the greatest distrust by the poor. Under this plan, instances will never be wanting of self-willed parents obstinately resisting the law, and suffering child after child to perish of a loathsome disease, and to keep up a constant dépôt for the spread of the infection.

If the Act is not amended in this respect, we presume it will hardly be seriously asserted that enough has been done to conciliate the sympathy of the medical profession, or to secure their all-important assistance. Under an amendment, it is indeed provided that any practitioner may vaccinate, and thus a mother will not be driven to the alternative of taking her child to a stranger, or of defying the law. But we will leave it to our brethren to decide whether the proffered shilling a-head is a sufficient remuneration.

We have reason to believe, that a suggestion made by us, some time ago, with the view of increasing the effectiveness of vaccination, and of obtaining more accurate data for the scientific appreciation of its protective influence, will be adopted. When analyzing the facts put forth by Mr. MARSON, we showed that the protective influence bore a definite relation to the number of vesicles produced: we urged

the importance of registering, not only the fact of "successful vaccination," but of recording the precise amount of the success obtained. We believe that this will be consequently provided for.

In closing our observations upon the subject, we beg to assure Lord LYTTELTON, that we are no less sincerely solicitous for the success of the cause he has in view than himself; but we claim to be somewhat better informed than his lordship as to the conditions necessary to insure success.

THE aspect which the question of Dr. CORMACK's veracity as a public journalist has now assumed, induces us to say a few words on the subject of Dr. CORMACK's supposed vote at the late anniversary meeting of the Medico-Chirurgical Society. In the course of the events to which this circumstance has given rise, the Editor of the *Association Journal* has charged us with lying and slandering, as our most venial crimes, and we really wish the profession to judge in this matter betwixt ourselves and him.

In the number of this journal for March 18th, 1854, we stated that Sir JOHN FORBES and Dr. CORMACK had voted for the exclusion of THE LANCET from the Library of the Medico-Chirurgical Society on the 1st of March. We commented in severe terms upon the circumstance that two persons connected with the press should, on a question vitally affecting its liberty, have voted against their own calling. At this charge, Dr. CORMACK waxed indignant, and in the *Association Journal* of March 24th denied it in the most strenuous language. He said, "Our answer to the personal charge is easy, and it shall be brief. The stab has been aimed, like the assassin's, in 'the dark; for Dr. CORMACK DID NOT VOTE AT ALL,' [the small capitals belong to our contemporary.] 'The charge is simply untrue. We pass on therefore to the public aspect of the question. The liberty of the medical press, it seems, is at stake; and we have been 'traitors to the cause!' We plead NOT GUILTY."

We did not set any great value upon Dr. CORMACK's denial, seeing that the very article which contained it was a violent attempt to influence the votes of the Fellows against us at the meeting of the Society on the 24th of March; and that, on the 28th of the same month, a memorial against THE LANCET, signed by Dr. CORMACK, was presented to the Council. Dr. CORMACK appeared, however, to see a great difference between voting with the pen and by show of hands. In the next number of THE LANCET, April 1st, referring to the dastardly conduct of the contemporary medical press, we, nevertheless, accepted Dr. CORMACK's repudiation. We then stated,—“We were assured, upon what we considered good authority—that is, the word of a Fellow of the Medico-Chirurgical Society who sat near Dr. CORMACK at the annual meeting, given personally to ourselves—that he, Dr. CORMACK, voted in favour of Mr. DE MORGAN's amendment. Dr. CORMACK tells us that he did not so vote, and we, of course, believe his assertion.”

Thus the matter rested until the quarrel occurred between Dr. O'CONNOR and Dr. CORMACK. On the 27th of May there appeared in THE LANCET a letter from Dr. O'CONNOR, which contained the following paragraph, relating to Dr. CORMACK's conduct at the meeting of the Medico-Chirurgical Society, on the 1st of March:—"I sat opposite to him, (Dr. CORMACK,) and he was noticed, by other Fellows of the Society besides myself, to record his vote against THE LANCET. There is no blame to

"be attached to any man for doing that which he conscientiously considers correct." In a subsequent letter to Sir JOHN FORBES, Dr. O'CONNOR re-asserted this statement. He said, "After the speeches for and against the question of the amendment, when the motion was put by the chairman, the first time, Dr. CORMACK held up his hand, with the others, in favour of the amendment. Such, Sir, is what I observed on the 1st of March, to the truth of which I give a solemn declaration."

In reply to this, Dr. CORMACK produced a letter from Mr. ANCELL, which contained the following passage:—

"I hereby state that I sat next to you upon the occasion in question, that a conversation occurred between us on the subject of your vote just before the voting began, and that I can positively assert that you did not vote."

Thus an equipoise of assertion and evidence existed; but Dr. CORMACK's partisans, without any investigation whatever, at the adjourned meeting of the Metropolitan Counties Branch of the Association, held on the 13th of June, coolly passed a resolution to the effect that the meeting, "having inquired minutely into the subject at issue, finds that no foundation existed for any such charge." Dr. CORMACK, of course, in the next number of the *Journal*, rode off upon the high-moral horse. The foregone conclusions of his dupes or accomplices are dignified with the title of a "trial;" and the then complacent editor of the *Journal* covered himself with self-praise and chuckling.

"We felt," he writes, "that we had no right to defend the honour and respectability of our constituents, unless we could clearly vindicate our own veracity in the face of friends and foes; and, having done so, it appeared to us equally incumbent upon us to submit the charges, the evidence, and the verdict, to the whole Association. It is no light thing for a gentleman to be placarded as a liar; and it is no light thing for upwards of two thousand members of the medical profession to be told that it is to a person so infamous that they have committed difficult and responsible duties—duties which can only be performed by an individual."

Unluckily for Dr. CORMACK, corroborative evidence of the truth of Dr. O'CONNOR's statement was not long wanting. In THE LANCET of June 24th, we were able to state authoritatively,

"We have heard Dr. Tanner, a man of unquestionable veracity, say that, sitting next to Dr. Druitt at the annual meeting of the Medico-Chirurgical Society, he made this observation on observing Dr. Cormack hold up his hand against THE LANCET, 'How very indecent of Dr. Cormack, voting on this question!' To which Dr. Druitt replied, 'Well, but he is a Fellow of this Society.'"

Upon this, the correspondence recorded in our last between the Sub-Editor of this journal and Dr. TANNER and Dr. DRUITT took place. Dr. TANNER simply, but emphatically, reiterated the truth of the paragraph in THE LANCET of June 24th; Dr. DRUITT assumed as many attitudes as a postur-master, and expressed the greatest confidence in Dr. TANNER, Dr. O'CONNOR, and Dr. CORMACK, in fact, in everybody but himself, and ended by admitting, that since Dr. TANNER said he had addressed him in the way stated, he had no doubt it was true.

Thus the matter stands. We put it to our readers whether, according to the evidence now before the profession, we were not justified in stating, on the 18th of March, that Dr. CORMACK voted at the meeting of the Medico-Chirurgical Society. We have direct evidence of a positive kind from Dr. TANNER and Dr. O'CONNOR, not to speak of Dr. DRUITT, and the private communications we have received against the negative certificate of Mr. ANCELL. The CORMACK clique in the Metropolitan Branch

have, without evidence and without inquiry, given a verdict against Dr. O'CONNOR and in favour of Dr. CORMACK, but the Association and the profession at large will require further testimony than Dr. CORMACK has yet been able to adduce, before they receive his assertions as implicit truth. Meantime the Association, instead of pursuing the useful tenor of its way, has had its patience and its funds exhausted by the discussion of Dr. CORMACK's veracity. The result is that there is a growing feeling among the oldest and most influential members of the Association, that there can be no peace in the Society until the Metropolitan Branch, which has caused so much mischief and disturbance, shall have been lopped from the parent trunk !

THE wretched policy pursued towards the naval medical service will speedily, by its fruits—by unanswerable experience—convince the world that the Admiralty Board has been not only impolitic in its foolish contempt of the just claims of an honourable profession, but also culpably reckless of the health of the fleet ; and heedless, so long as they can gratify a childish and senseless spleen, how they jeopardize the honour of their country. Complaints of the insufficiency of the medical staff are now loud and frequent from the Baltic fleet ; and great is their need. On the eve, probably, of sanguinary engagements, in the actual presence of pestilence, placed in a position which calls imperatively for a medical staff on a scale surpassing, rather than falling short of, the war complement, the Baltic fleet cannot muster the complement not found excessive in times of peace. The cholera, it is said, has already made its appearance in Cronstadt. Several cases are reported as having occurred on board the *Wellington*. One change in the weather suddenly affected the health of the crews, and but for an opposite change, sickness might have devastated the fleet. How long will the Admiralty trust the safety of our naval armaments to the weather ? Presuming on the natural course of events, hot weather must surely be looked for in the Baltic.

A few days of unusual warmth have already warned the fleet of what dangers they must encounter from heat more intense and more prolonged. It is presumed that this magnificent fleet has an object to accomplish ; it is presumed that it is expected to maintain the honour of the British arms. But does not the history of war, both by land and sea, furnish examples enough to show that more battles have been lost, more great enterprises foiled, through sickness than by the skill or valour of the enemy ? How greatly the success of our naval forces against the Iron Despot of the North must depend upon the health of our brave seamen is obvious to everyone. At any moment the spirit of the fleet may be depressed, and its right arm paralyzed, by sickness. It is not too much to say that, in such an event, the hazard of an attack upon Cronstadt will be fearfully increased ; and that if success should follow, it will perhaps be due as much to the equal prostration of the enemy through disease, as to the vigour of the assault.

Unappalled by such a prospect, it is said that a naval Lord has expressed his determination "to resign rather than be beaten by those d—d doctors." We venture to prophesy that before long the fleet and the country will declare, in a manner that will not be mistaken, which of these two events is the greater calamity—whether an Admiralty Lord or a complement of surgeons is the more useful.

OUR readers will perceive, in last week's LANCET, a memorial of the lecturers in the Medical Department of the Newcastle-on-Tyne College of Practical Science. As the memorial calls the attention of the profession to what may become a very serious grievance, we shall endeavour to explain the matter to our readers.

The University of Durham was, until lately, a purely clerical institution, devoted to the education of clergymen of the Church of England. So exclusively is it now in the hands of the clergy, that the only man of the smallest eminence connected with it, *Professor JOHNSTON*, has, in reality, no right to that title. His style is *reader* in Chemistry. The very title indicating the ignorance and exclusiveness of the clerical governors. The *reader* in Chemistry is not thought sufficiently dignified to have the *least* voice in the government of the University ; and, in all probability, his reverend colleagues are ignorant of the fame of their illustrious subordinate. In fact, Durham is a little Oxford, with all its exclusiveness and none of its dignity. The charter of the University of Durham, however, confers upon it the power to grant not only medical degrees, but *licences to practise medicine and surgery*. These powers remained dormant, until the prosperity of the original Medical School of Newcastle led the Durham clergymen to conceive that through it they might exercise their privilege—the idea being, that the medical education might be got at Newcastle—the degree conferred at Durham. It was an ill-omened proffer for the Medical School of Newcastle, and led, in conjunction with some personal differences, to the breaking-up of that establishment, and, ultimately, before any arrangement, we believe, had been agreed to with Durham, to the formation of two rival Medical Schools, one section of the profession at Newcastle attaching themselves to Durham, the other pursuing another course, and seeking to form an extensive institution for teaching the various branches of practical science in conjunction with Medicine.

With the merits of the quarrel we do not intend to meddle ; but certainly it will be a strange thing, if *one division* of the profession in Newcastle, under the ægis of Durham, and a small party of clergymen, should possess the power of supplanting, to a great extent, the great Universities and the Colleges of Physicians and Surgeons ! We do not know the medical gentlemen who are to have practically the power of conferring these degrees under the University of Durham ; but the town of Newcastle is not likely to possess many men adequate for such a pre-eminence, or whose fame could justify such a position ; and as we perceive appended to the memorial against the University of Durham the names of Sir JOHN FIFE, Dr. ROBINSON, Mr. POTTER, and Dr. DAWSON, amongst others, lecturers in the College of Practical Science,—men, we believe, of large practice or distinguished reputations as surgeons and physicians, we cannot conceive that the rival school, in a town like Newcastle, can possibly possess lecturers of sufficient pretensions to warrant the right claimed on their behalf through the intervention of the University of Durham. In the present state of the profession, then, and of the question of Medical Reform, we must regard the thrusting in of this new claim amid the many conflicting ones which already exist, as an intolerable nuisance. It is a sufficient disgrace to us that the Archbishop of Canterbury can make his footman a physician, but the privilege is antiquated ; that a few obscure Durham clergymen, acting through a mere section of the medical profes-

sion in Newcastle, should obtain and exercise such a power in the present day, is a piece of impertinence which would be ludicrous, were it not dangerous.

WE record with infinite satisfaction the result of the proceedings in the House of Commons on Wednesday last, in reference to the Medical Graduates' Bill of the University of London. The discussion, and the triumphant divisions that took place, prove beyond a doubt the firm hold the Metropolitan University has taken upon the public mind. It will be recollected that the object of this Bill is to place the medical graduates of the University of London upon the same footing with regard to civil privileges as that enjoyed by the Universities of Oxford and Cambridge. The Bill having passed the first and second readings on Wednesday last, the clauses were considered in committee. Several attempts were made by the representatives of the monopolist powers to thwart the progress of the measure. On the very morning of the debate, the President of the College of Physicians or that of the College of Surgeons, waited upon Lord PALMERSTON, "to suggest some other arrangement." The Scotch representatives seem to have thrown what obstacles in the way they could, although it is impossible to see what *locus standi* they could have in a measure of purely English interest, which in no way affected the Scotch Universities and Medical Corporations, and to which, *ex debito justitiæ*, the University of London was fully entitled. The first division taken was on the question of going into committee. This was carried by 90 against 26, giving a majority of 64. All the clauses passed through, and the House resumed. We are happy to state that the medical members of the House, Dr. MICHELL and Mr. BRADY, warmly advocated the measure, and we have no doubt their support had its weight with the House as expressive of the feelings of the profession on the subject.

We heartily congratulate the Graduates of the University of London upon their success. They have achieved it mainly by their own energy. We cannot but feel great satisfaction in the reflection that we lent them our warmest and most active support at a time when, with the exception of this journal, they were opposed by the whole medical press.

It will be seen from the subjoined report of the Select Committee on Poor-law Medical Relief, that it is proposed, amongst other changes in the law, to take the power of dismissing an Union surgeon out of the hands of the Boards of Guardians. This is undoubtedly a step in the right direction, but it may be questioned whether the proposed alteration is altogether free from objection. It is unquestionable that many of the worst evils of the present system have originated in the arbitrary power vested in the local boards, and these evils have been repeatedly exposed in this journal. But it is another thing, whilst making the medical officer independent of the tyrant board, to make him also independent of his professional brethren. This evil, however, bears no comparison to that which it removes, and therefore we congratulate our brethren upon the proposed change. The recommendation of the Committee that the salaries of the medical officers in some districts should be increased, and the districts in some unions made smaller, is such an one as could not fail to have been made by men so competent to form an opinion upon the matter, as the gentlemen constituting the Committee. We cannot see upon what just grounds persons,

not otherwise paupers, are to receive medical relief, unless indeed it is proposed to pay the medical officer extra for such cases. It is desirable, when the matter comes before Parliament for discussion, that this contingency should be provided for. It would be simply an act of justice, and would possibly meet with support. There is, however, a mode in which the system of medical relief might be carried out with more efficiency with respect to the poor, and more satisfactorily with regard to the practitioner, than has been suggested by the Committee. To this mode we shall shortly direct our attention.

The select committee appointed by the House of Commons to inquire into the mode in which medical relief is now administered in the different unions in England and Wales, and to ascertain whether any additional facilities might be afforded the poor in obtaining medical aid, have made the following report:—  
 "1. That no sufficient evidence has been adduced before your committee to justify their recommendation of an entire change in the present system of medical relief as administered under the general consolidated order of 1847, by means of which the poor have derived greater facilities in obtaining medical aid than they were enabled to do previous to its promulgation. 2. Your committee, however, recommend that the Poor-law Board should continue to direct their attention to the extent of the medical districts, to the reduction of their area where they are found to be inconveniently large, and to the appointment of additional medical officers in such cases. 3. Your committee also recommend that every medical officer to be appointed after the 25th of March, 1855, should continue in office until he may die, resign, or become legally disqualified to hold such office, or be removed therefrom by the Poor-law Board. 4. They also recommend that the Poor-law Board should direct their attention to the salaries of the medical officers, which, in some cases, appear to be inadequate to the duties they are required to perform. 5. Your committee further desire to call the attention of Parliament to the facts given in evidence, that a considerable number of poor persons have been placed on the pauper list through the receipt of medical relief in cases of sickness or accident, and from that cause alone; they therefore recommend that persons so circumstanced should be enabled to receive such medical assistance as their cases may require, without being placed on the list of paupers, but that it should be left to the boards of guardians to decide in what cases medical relief shall be so given to persons who are not otherwise in want of, or in the receipt of, parochial relief. 6. That evidence has been given before your committee respecting purely medical clubs, the contributors to which are entitled to attendance and medicine alone, with the option of selecting their medical attendant; that in some districts, where provident habits are encouraged amongst the industrious classes, the existence of such clubs, mainly maintained by their contributions, evinces at once the value they attach to prompt medical attendance, and an honest desire on their part to maintain their independence." Several plans appear to have been under consideration in reference to the important subject to which the fifth of these articles relates. Mr. Miles proposed "that free medical and surgical assistance be given to the labouring population whose wages do not exceed a certain amount, to be determined by the boards of guardians." Mr. Walter proposed the following resolutions:—"1. That it is expedient to afford facilities to the labouring classes for obtaining medical relief, without reducing them to the necessity of becoming paupers. 2. That it appears to your committee that this object might be accomplished by means of parochial medical clubs, under the management of the local boards of guardians, the subscribers to which might be entitled to receive medical relief without incurring thereby the stigma of pauperism. 3. Your committee recommend that the medical officers of unions should be elected for a certain term of years, subject only to dismissal for misconduct, instead of, as is frequently the case at present, receiving their appointments annually." The report, however, in the form in which we have given it above, was eventually agreed to, Mr. Walter and Mr. Miles both voting in favour of the fifth paragraph, which was carried by the casting vote of the chairman. Mr. Palmer moved that the report should recommend "that every medical officer be required to attend on any poor person on his first application for medical assistance, without waiting for an order from the relieving officer or other person." Five other members of the committee voted for this clause—Mr. Miles, Mr. Pigott, Mr. Walter, Mr. Rice, and Mr. H. Berkeley; but seven voted against it, and threw it out.

## THE POSITION OF THE PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

THE following letter has been addressed by Mr. Bottomley, of Croydon, to Dr. Cormack, the editor of the *Association Journal* :—

Croydon, July 4, 1884.

SIR,—I wish to make a few observations upon that portion of the report of the Metropolitan Branch meeting of the 20th of June last relative to my claim of membership.

In No. 23 of the *Journal* of last year, dated the 11th of June, appeared the following:—"Members of the Provincial Medical and Surgical Association have the right of becoming members of the Metropolitan Branch by simply paying the annual subscription of 2s. 6d. to J. Toynbee, Esq., treasurer, or T. O. Ward, M.D., secretary." At the formation of the Metropolitan Branch I received a circular inviting me to become a member of that Branch. It was my intention to accept the invitation, and a few weeks ago I took the liberty of asking a member of the Branch to pay the 2s. 6d. and send me the receipt. The 2s. 6d. was paid, and the receipt sent, and I considered myself a member, and attended the meeting of the 13th June, but was reported as being present as a *visitor*. On the following Tuesday, the 20th of June, I attended the adjourned meeting, with the view of having what I believed to be an error rectified; but the voice of the meeting then present was against my being a member.

As a member of the Provincial Medical and Surgical Association of some years' standing, and also one of the General Council, I deem it my duty to offer a few remarks upon the present proceedings of the Metropolitan Branch.

The Metropolitan Branch has made a bye-law for its own government, and acted upon it. Query, has a Branch that power? I should say, no! The Branch, in my opinion, should have first submitted such bye-law to the General Council at the annual meeting, for the Council to determine whether such bye-law should be adopted or rejected; making such alterations in the bye-laws is, in my opinion, contrary to all rule and order, and directly opposed to the constitution of the Association.

Until the subject be fully discussed by the General Council at an annual meeting, I consider the law for the admission of members to the Branch to be in force till rescinded by the General Council. Why was the Provincial Medical and Surgical Association founded? I presume for the following reasons, but principally in consequence of the very decided difference that exists between the provincial and metropolitan practitioner. The provincial practitioner is a one-faculty practitioner; not so the metropolitan. In the metropolis the practice is divided into three grades—physician, surgeon, and apothecary; in the provinces, the surgeon is the physician and the physician-accoucheur,—in short, he takes the weighty responsibility of the whole upon himself, not being content with performing the minor operations merely, as has been stated in the College of Surgeons in London, which is more applicable to the metropolitan practitioner; but he, the provincial surgeon, performs all the capital operations in surgery, not even declining the most serious and difficult, such as amputation at the hip-joint, &c. The metropolitan practitioner divides his responsibility with some consulting brother; not so the provincial, for a pure surgeon is a very scarce person in the provinces. Thus it appears the interests of the two must be widely different, which difference bids fair to create a schism in our ranks. It will therefore become a question at the next annual meeting, whether the cares of the Association should not be confined to the provinces, and whether the metropolis should not itself take charge of its own practitioners? We of the country look forward to our annual meetings, as well as the provincial branch meetings, with feelings of pleasure and delight, where the greatest harmony and good feeling have always prevailed; and we fervently hope that no seeds of discord sown in the metropolis will take root and flourish amongst us.

Again, unless a material alteration is made in the manner of conducting the *Association Journal*, I think it had better be given up altogether, in which case an ample balance could be devoted to the publication of an annual volume of *Transactions*, which should form a valuable record of our progress in pathology and therapeutics. It appears to me, I believe in common with a very large number of my provincial brethren, that a weekly record of professional news is no part of our wants as members of the Association, more especially as a large portion of the so-called news relates to the personal squabbles of individuals of whom we know nothing, or to the party intrigues of cliques of which we desire to know less. We of the country want not to have such scenes perpetuated in the

columns of our *Journal*. That they happen in London gives them not one whit the more value or interest to us. We have all our share of personal disagreements, doubtless, but I think we have no wish to obtrude the particulars of such unfortunate occurrences upon our brethren of the profession elsewhere. Sound progress in professional knowledge will be better ensured by the production of papers suited to the *Transactions* than of ephemeral notices of current events of no importance to the profession, and very frequently of a character discreditable to it.

I beg leave to suggest the foregoing observations, without intending the least mark of disrespect to the metropolitan practitioners, for, being their near neighbour, I am personally known to many, and I regard them as ornaments in the medical and surgical profession not to be surpassed in the world.

I am, Sir, your obedient servant,  
GEORGE BOTTOMLEY.

Dr. Cormack.

## Correspondence.

"Audi alteram partem."

## GRIEVANCES OF UNION SURGEONS.

MERE UNION, WILTSHIRE.

To the Editor of THE LANCET.

SIR,—I submit the following communication to your perusal, and if you think any good may be done by publishing it, you have my perfect permission to do so.

At a time that so many of my professional brethren are relating the wrongs and injustice to which they have been subjected by boards of guardians, with the view of calling the attention of the legislature to what are esteemed to be the grievances of poor-law union medical officers, it may be to the purpose to state what has occurred, within the past year, at the board of the union of which I am a medical officer.

The Union of Mere, in Wiltshire, is divided into two districts, (Nos. 1 and 2.) In the Lady-day quarter of 1852, an epidemic fever (gastro-enteric) was very prevalent in District No. 1, and my colleague had heavy duties to perform. Accordingly, at the termination of the quarter—the period at which salaries are paid—he petitioned the board of guardians for extra remuneration for the services rendered to the sick poor, and this was responded to by a donation of twenty guineas. The epidemic did not become severe or general in the villages comprised in District No. 2 until the early part of the Midsummer quarter corresponding, at the termination of which, encouraged by the success of my colleague, and fully reliant on the honour and sense of justice of the board of guardians, I, in like manner, memorialized for extra remuneration, but met with a positive refusal. I then inquired upon what grounds I was refused a remuneration and treatment similar to my colleague; and, in answer, was assured that "the board was satisfied with the assiduity and attention I had shown in the discharge of my duties, but declined to alter their previous determination." I then pointed out to the board that, by the statistical tables of cases attended by the medical officers respectively, during the half-year from Christmas to Midsummer, 1852, there was a positive excess of cases attended by me to nearly eighty; and that, as the patients of my colleague were chiefly centred round his house, those of my district were, the nearest, two miles, the furthest, from six to seven miles, distant from my own residence, I was therefore the more entitled to the compensation. To this communication I was told curtly "that the board did not see fit to alter its determination."

I then placed the facts of the case, and copies of the correspondence, in the hands of the Poor-law Board at Whitehall, and I plainly stated to them that I was not singular in the opinion, that gross favouritism had been shown to my colleague, attributable to the strength of family cliquism in the board, most of the members of which are nearly or distantly related to him, the board consisting (at that time) entirely of renting farmers and tradespeople, but without the presence of one private gentleman.

I must acknowledge the instant attention paid to my letter by the Poor-law Board, which commenced a correspondence with the board of guardians, and, after some investigation, I have been told, strongly recommended them to remunerate me on the same scale as they had remunerated my colleague, but without avail. They objected, first, that I had made up a book of cases,—meaning, that I had entered more cases in my

sick-list book than I had legitimately attended. To this base insinuation I replied, through the Poor-law Board, that, having held very responsible positions in India, under the Government, with valuable testimonials of ability and rectitude of conduct, I did not stand in need of the board of guardians pointing out to me what was a line of conduct in accordance with integrity and honour; and that, as the cases referred to were remitted, individually named in the sick-list, fortnightly, for their inspection, the argument for their repudiation was untenable, as no objection had been raised at either instance of their inspections. Their next plea for refusal was, that most of the cases recorded had been attended by me without especial authority. In our union, it is not usual to send to the relieving-officer for orders in all the cases of applicants for union medical relief. Each medical officer knows his district well, and all the respective poor in them entitled to pauper medical relief; and as the districts are very extensive, the relieving-officer requires to be away from his house, on his own duties, almost daily, from morning till night; that to refuse to attend most of the applicants until they had obtained the order of the official would be seriously inconvenient, and a gross injustice and uncharitable to the poor, many of whom have to travel miles, or to relinquish their employment, when waiting on their medical attendant.

I regret to inform my medical brethren that, after a considerably lengthened correspondence with the board of guardians, the Poor-law Board terminated the matter by wiggling me for irregularity, and recommended me, for the future, to be more strict in complying with the rules, of which I have just shown the injustice.

I was not in a position to resign my appointment as district medical officer, and I deeply regretted it. Would that there were sufficient unanimity in our profession, that we could chastise our aggressors, when they venture unwarrantably to trample upon us! As if impressed with the necessity and propriety of having rank and education in the board, conscience stricken, the board of guardians have now elected and obtained a gentleman, possessing both, to the office of chairman. Need I say I failed in obtaining the remuneration I sought for, and there the matter rests?

Surely the Government and the public would never wish such irresponsible powers to be wielded by boards of guardians as it is shown so frequently they do wield; and may we hope the day is not far distant, when poor-law union surgeons may look to the Government for approval or for censure, and their corresponding rewards and punishments.

There are two taxes, which I think, on due representation, might be remitted to our much-oppressed class—that of turnpike tolls, and of one horse and carriage, used for the benefit of the poor, and especially in the duties attached to the office of poor-law union surgeon. Officers of the army on duty always pass through tools free of expense, and to many of the country general practitioners, doing pauper union duty, a similar concession would be very valuable. To visit some of my pauper patients in a carriage, by the direct road, would cost me 10*d.* Remission of tax on one horse and carriage, and perhaps it may be conceded, on one man-servant—a necessary requisite—would to some extent tend to relieve the already much-imposed upon union medical officer.

I beg to remain, Sir,

Your obedient servant,

AYNOTT J. J. CHITTY, M.R.C.S.E., &c.,  
Medical Officer, 2nd District, Mere Union.

Mere, Wilts, June, 1854.

## THE ASSOCIATION JOURNAL AND DR. CORMACK.

To the Editor of THE LANCET.

SIR,—I have often felt surprised that you have not called the Editor of the *Association Journal* to account for the grossly vulgar and slanderous language in which he indulges in the leading articles of the periodical entrusted to his care—language which, before his advent, was certainly foreign to the medical press, and which I believe to be utterly distasteful to the great bulk of the members of the Association to which the *Journal* belongs. It is really astonishing how any man, under the guise of Calvinistic puritanism, with pretensions to the most sanctimonious rigidity, and an affectation of evangelical meekness, can gather together such a mass of ribald language as he frequently includes in what must, I suppose by courtesy, be called leading articles. If our lugubrious Editor quotes prose, it is pretty sure to be from Holy Writ; if poetry, it is almost as certainly from Watts' Hymns or Young's Night Thoughts; but with the highest reverence for such

matters, I venture to demur to their being profanely introduced to bolster up bad arguments or meagre ideas.

I read the *Association Journal* and THE LANCET habitually, and I felt indignant when I saw in the *Journal* of May 12th an odious slander against the whole profession. It refers to THE LANCET, it is true; but it is substantially a vilification of the medical men of this country as a body. The libel I refer to is as follows:—

“When THE LANCET imputes vile and dishonourable conduct to individuals, it is chiefly because his readers *must have* spicy and abusive articles. THE LANCET commands an adequate sale by trafficking in calumnies, and until the morality and good taste of the profession become improved, it would be a commercial blunder in our contemporary to write in a different style from that which he now adopts.”

Now, Sir, this is not an attack upon you, but upon the profession itself. With respect to the style of the writing in the leading articles of THE LANCET, I will only say that I believe there is not a man in the profession who has not often read them with pride and pleasure. For power of language, fertility of thought, and felicity of expression, they may, in my opinion, challenge comparison with any of the periodical writing of the day.

Of the style of the *Association Journal*, the passage I have quoted is not so bad a specimen as might easily have been selected. But with respect to the odious aspersion against medical men, that bad language, “abusive articles,” “trafficking in calumnies,” and the imputation of “vile and dishonourable conduct,” are required by the “taste of the profession,” I hurl it back upon Dr. Cormack, as a most base and wicked calumny, a calumny especially hateful, as coming from a medical journalist, and the more reprehensible as it is accompanied by ostentatious pretensions to extraordinary virtue and purity.

I am, Sir,

AN OLD SUBSCRIBER OF THE LANCET, AND A  
MEMBER OF THE PROVINCIAL ASSOCIATION.

## DISCREPANCIES IN ANALYSIS.

To the Editor of THE LANCET.

SIR,—I beg to submit the following, should you deem it worthy of insertion in THE LANCET. At the same time that it points out a very great discrepancy in the analysis alluded to, I think the processes adopted by me will be found to give more satisfactory results than those at present in use.

The circumstances are these:—A short time since a friend of mine consulted a medical gentleman for diabetes mellitus, who made an analysis of his urine; and from the large quantity of urea stated to exist, I suspected an error had been made, since it is generally admitted that urea decreases in proportion as the sugar increases, and in some instances does not obtain at all. The specific gravity of the urine was 1.035. Dr. B states that every fluid ounce contained 30.02 of sugar, and 10.25 urea. Now, 1000 grains of urine are equal in measure to 2½ ounces; so that

	Sugar.	Urea.
if 1 fluid ounce contains ...	30 gr.	and 10½ gr.
2½ (or 1000 gra.) contain ...	67½	and 23½ = 90½

90½ grains would therefore be the estimate of urea and sugar per 1000, without taking into account the saline matter.

I examined the same patient's urine, and found the specific gravity to be, by balance, 1.033. 1000 grains were vaporated to ¼th, and an equal bulk of strong nitric acid added, and the resulting crystals of nitrate of urea, on being pressed and dried, gave 12 grains, and since the combining proportions of nitric acid and anhydrous urea are about equal, 6 grains would be the whole amount of urea obtained. The various pieces of paper on which the crystals were pressed and dried, on being digested in distilled water, and the draining of the crystals added and evaporated to absolute dryness, gave, as

solid matter ...	70 gra.
to which, if we add the 6 grains of urea previously extracted ...	6
	76

we get, as the actual dry contents per 1000, 76 grains.

In order to ascertain the precise quantity of sugar contained in the above, I subjected 500 grains of the same urine, in a weighed bottle, to fermentation, which showed a loss in carbonic acid of 10 grains; this multiplied by 2½, the equivalent for sugar, gives as sugar 45 grains. 45 grains therefore is the whole amount of sugar possible to be obtained, which was further confirmed by the next experiment.

The fermented liquor, being filtered off from the excess of yeast and evaporated to dryness, afforded 15½ grains of solid matter, which of course consisted only of urea and salts; this, multiplied by 2, gives the quantity per 1000 ... 31 grs.  
from which, if we deduct the 6 grains of urea previously ascertained ... 6  
25

leaves 25 as the saline matter present.

The analysis may therefore now be considered complete, viz. :—

	Grains.
Urea ... ..	6
Sugar ... ..	45
Saline matter ... ..	25
Albumen ... ..	0
Lithic acid ... .. (mere traces)	0
Earthy phosphates ... ..	0
	76
Water as loss ... ..	924
	1000

#### COMPARISONS OF ANALYSES.

I am, Sir, yours respectfully,

The Laboratory, Cheltenham,  
June, 1854.

JOHN HORSLEY.

### THE MEDICAL PROFESSION AND LIFE ASSURANCE COMPANIES.

To the Editor of THE LANCET.

SIR,—I have forwarded the following note to the Secretary of the Edinburgh Life Office, and, as I told him that I should forward it to THE LANCET for insertion, I shall be obliged by your allowing it to appear in your pages.

I am, Sir, your obedient servant,

Minchinhampton, March, 1854.

C. H. TURNER.

"Edinburgh Life Assurance Office, London.

"All communications of this nature being intended equally for the benefit and security of the party to be insured, and of the Company, permit me to request the favour of your observing much precision and care in stating the answers, and should the necessary return not be made within seven days from this date, the directors will conclude that you do not consider the life insurable."

Minchinhampton, March, 1854.

SIR,—One of your agents has forwarded to me a circular with the above extract, and a request that I would answer a string of medical interrogatories on the life of a person proposing to insure in your office. The same post brought a proposal on another life from the Legal and Commercial Office; that paper I immediately filled up, because mention was made that the proper fees would be paid; your paper I decline to fill up, because you refuse to pay for a communication which you admit is intended "for the benefit and security of the Company." There is no doubt not only that the "security" of your Company, but that of every other, mainly depends on the "precision" of the medical report; you have no right, therefore, to ask such important information gratuitously, it is clearly unjust and in direct variance with the well-admitted maxim, "that the labourer is worthy of his hire." You would not venture to ask a lawyer one point, much less request a string of questions to be replied to, without remuneration; neither would you ask a clergyman to give you a certificate without paying him, and suffer me to assure you that such a state of things will shortly cease with my own profession.

I leave you to draw your own conclusions upon the life which you have forwarded for my consideration now, or at the expiration of "seven" days; in the meantime, however, I shall advise the party to make application to some office whose circumstances will admit of their paying for that upon which the stability of their Company must depend.

I have the honour to be, Sir, your humble servant,

C. W. TURNER.

To the Secretary of the Edinburgh Life Office, King William-street.

### ABUSES AT THE MANCHESTER ROYAL INFIRMARY.

To the Editor of THE LANCET.

SIR,—Devoted as you have ever been to the interests of the medical students, I presume to address you in hopes that (if you will oblige by giving this letter a place in your valuable journal) it may be the means of putting an end to some of the abuses of this hospital. I am one of those fortunate individuals whom the governors of this institution have honoured by accepting the trifling sum of fifty guineas for the inestimable privilege of walking the wards, in company of about ninety equally lucky youths. I have now been a pupil of this hospital two years, and have seen occasionally the gleam of the knife, but I have rarely seen more; for I assure you, Sir, I have never had a fair and distinct view of an operation, on regular operating days, since I have had the happiness to be attached to this establishment. That part of the theatre where the patient is placed is always filled with visitors, surgeons, dressers, and house-surgeons, &c.; and, although there is ample space for all, they literally club their sagacious heads together, and—but need I say more?—the pupils in the first row endeavour to overtop them, and those in the second and third rows follow their example, and are under the necessity of standing on the rails, posts, &c., to obtain a casual glance of what is going forward.

Then, the first step towards remedying this evil would be, the enforcing a restriction to prevent the surgeons cramming the operating theatre with individuals who are of no earthly assistance. I appeal to the oldest pupil, to the surgeons themselves, whether I have overstated the plain facts. Let not any one suppose that we (the pupils) object to visitors—far from it; but we must not suffer inconvenience by them, and if they honour us with their presence, they should share our accommodation, and not obstruct our view.

Another cause of complaint is, that the surgeons do not give any clinical instruction at the bed-side. Surely a surgeon, if he wishes to improve his pupils, would make such remarks, as he walked from one bed to another, as are worthy of being communicated; and then, when the pupils leave the hospital, they would have the satisfaction of knowing they have received something for their money.

Trusting, in fairness to the students, that you will insert this communication,

I remain, your obedient and humble servant,

The Library, July, 1854.

REFORMER.

### Parliamentary Intelligence.

HOUSE OF LORDS—TUESDAY, JULY 11TH, 1854.

CHARGES AGAINST THE BOARD OF HEALTH.

THE EARL OF SHAFTESBURY said, that he wished to claim the indulgence of their lordships while he called their attention to certain charges which had been made in another place against a public board with which he was connected, and which charges therefore, to some extent, reflected personally on himself. He had the less inclination to apologize to their lordships for calling their attention to the subject, because the charges to which he referred were of a very serious nature, made in the absence of the parties against whom they were directed, and to whom no notice whatever had been given that such charges would be made. He therefore took the present opportunity of replying to the accusations to which he referred, which he might characterize as unjust and calumnious, and such as he could clearly prove were in every way unfounded. The charges were made by a noble lord in the other house, who had for two or three years been at the head of the department of Woods and Forests, and were directed against the chairman and officers of the Board of Health, the noble lord's former colleagues, against whom he had thought proper to bring forward two or three charges of misconduct so gross and—

EARL FITZWILLIAM rose to order, and said that the charges which the noble earl was about to deny did not in any way affect the noble earl as a member of their lordships' house, nor did they arise from anything he had done in that house. They were merely charges made in another house against a public board of which the noble earl was a member, and therefore he would submit that this was by no means a case of that nature or personal importance to induce their lordships to depart from their usual mode of proceeding with business, and justify its taking precedence of the order of the day. (Hear, hear.)

The EARL OF SHAFTESBURY had hoped that, after having

stated that the charges affected him personally, and also to a certain extent implied a charge of corruption, he might have been allowed to proceed. As it was, he could only yield to the rules of the House, and defer his remarks.

## HOUSE OF COMMONS—FRIDAY, JULY 7.

### MEDICAL PROFESSION.

Mr. CRAFTURD moved for leave to bring in a Bill to amend the laws relating to the medical profession.

Lord PALMERSTON hoped the hon. gentleman would not persevere with his Bill this year, but give the profession itself an opportunity of placing its views on the subject in a practicable form before Parliament. If the medical profession itself did nothing, the hon. gentleman could next session introduce the subject.

Lord D. STUART thought the introduction of the Bill would serve as a guide for the deliberations of the profession in anything it might contemplate doing.

Mr. CRAFTURD persevering,

The House divided, when the numbers were,—

For the motion...	...	...	...	9
Against it	...	...	...	70
Majority	...	...	...	—61

The Bill was accordingly rejected.

### SEWERS' COMMISSION.

Lord PALMERSTON obtained leave to bring in a Bill to continue for twelve months the existing Metropolitan Sewers' Commission, with limited powers, a larger measure, embracing more comprehensive sewerage powers, being postponed until next year, until after the report of the Corporation of London Inquiry Commissioners had been thoroughly considered.

### GENERAL BOARD OF HEALTH.

Lord PALMERSTON moved for leave to bring in a Bill for the continuance of the General Board of Health. The arrangement he proposed by this Bill was, that the Board of Health should be continued for two years from the end of next month, that it should consist of members to be appointed and to be removable by the Secretary of State for the Home Department, and that it should be subject to follow all the directions and orders which it might have from the Secretary of State. It appeared to him that the care of the health of the country was naturally one of the functions belonging to the department of the Home Secretary. At the present moment applications on the subject came to him incessantly from all parts of the country; but now the Secretary of State had no power over the Board of Health. When the proposed power and control over the board was vested in the Home Secretary, he hoped that those differences which had prevailed between local bodies and the general board would cease. At present the board was in the anomalous position of being an independent body, not subjected to any control, and not represented in that House; so that no person was answerable there for its acts. The Bill which he sought to introduce, in the first place, placed it under the control of an efficient and responsible department; and, in the next place, would give to Parliament a public officer answerable for the proceedings of the board.

Mr. HENLEY said, it did not appear to him, from what he had heard fall from the noble lord, that the noble lord was likely to constitute the board in a manner which would give satisfaction to the country.

Sir B. HALL hoped his noble friend would allow sufficient time to elapse between the first and second reading of the Bill, in order that the inhabitants, both of the metropolis and of the provinces, might see and have time to consider the powers given to the new board. He was afraid the board, as it was proposed to be established, would be unsatisfactory.

Sir G. PEACHELL hoped the country would not be saddled with the board for more than one year.

Leave was then given to bring in the Bill.

## COURT OF QUEEN'S BENCH.

TUESDAY, JULY 11, 1854.

(Before LORD CAMPBELL and a Special Jury.)

### YEARSLEY v. WAKLEY.

THIS cause came on for trial on Tuesday, Vice-Chancellor Wood having directed that the case should be submitted to a jury. Sir F. Thesiger, Mr. Lush, and Mr. Wordsworth, were for the plaintiff; the Attorney-General, Mr. Bramwell, and Mr.

T. Chambers, M.P., for the defendant. The action was for an alleged breach of copyright on the part of the defendant. It was asserted that, in the compilation of THE BRITISH MEDICAL DIRECTORY, he had made such use of the plaintiff's works, "The London and Provincial" and "Scottish Medical Directories," as amounted to an act of piracy. Sir F. Thesiger having opened the case, evidence was given of the proprietorship of "The London and Provincial Medical Directory," and the editor of that work was subsequently called. It soon became evident, however, that it would be impossible for a jury to determine the real merits of the case, from the time it would occupy, and the minute details to be investigated. It was mutually arranged that a verdict should be returned, *pro forma*, for the plaintiff, in order that the entire matter might be referred to a barrister, who should decide on all matters between the parties, including the proceedings in Chancery and at Common Law.

With reference to the proceedings in Chancery, Lord Campbell remarked, that it would have been better that the Vice-Chancellor should have adjudicated upon the matter in his own court.

The Attorney-General said that the defendant's counsel had pressed for a decision when the proceedings were before Vice-Chancellor Wood, and that he was quite willing to meet the case in any manner by which it could be fully investigated.

\* \* It will be seen that the verdict is a mere matter of form, and will not prejudice the ultimate settlement of the question. The action refers only to the BRITISH MEDICAL DIRECTORY of the last and the present year, and will not in any respect interfere with the publication of the edition of

THE BRITISH MEDICAL DIRECTORY FOR 1855.

## Medical News.

ROYAL COLLEGE OF SURGEONS.—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted Members of the College at a meeting of the Court of Examiners on the 7th inst. :—

BENNETT, FREDERICK, York-place, City-road.  
HUGHES, AZARIAH, Bodefern, Anglesea.  
REED, JAMES TAVERNER, Downham, Norfolk.  
SMITH, THOMAS, Tunbridge.  
STILES, BRADFORD, Marlborough, Wilts.  
STILWELL, GEORGE JAMES, Hillingden, Middlesex.  
THORNHILL, DAVID CLARKE, Stratford-green.  
WHITLING, HENRY TOWNSEND, Nuremberg, Bavaria.

The following gentlemen were admitted Members on the 10th inst. :—

COATES, GEORGE VINICOMBE, Hart-street, Bloomsbury.  
COVERNTON, CHARLES JAMES, Simcoe, Canada West.  
GREEN, WILLIAM, Mafren, Northumberland.  
HADON, GILBERT BETHUNE, Haseley, Warwick.  
LAURENCE, JOHN ZACHARIAH, Devonshire-street, Portland-place.  
MARSHALL, WILLIAM, Laurie-terrace, Westminster-road.  
MILES, HERBERT CHALMERS, the Charterhouse.

COLLEGIATE ELECTIONS.—At a meeting of the Council of the Royal College of Surgeons on Thursday, GEORGE JAMES GUTHRIE, Esq., F.R.S., was elected President of the College, being the third occasion on which this honour has been conferred on this Nestor of British surgery; and WILLIAM LAWRENCE, Esq., F.R.S., and BENJAMIN TRAVERS, Esq., F.R.S., were elected Vice-Presidents for the ensuing year. At the annual meeting of the Fellows of the College, on Thursday, the 6th instant, Messrs. JOSEPH HODGSON, of Westbourne-terrace, and FRANCIS KIERNAN, of Manchester-street, Manchester-square, were re-elected Members of the Council; and Messrs. JOHN HILTON, of New Broad-street, and RICHARD QUAIN, of Cavendish-square, were elected Members of the Council on the vacancies occasioned by the decease of Mr. Bransby B. Cooper, and the resignation of Mr. Thomas Cope-land.

LICENTIATES IN MIDWIFERY.—The following members of the Royal College of Surgeons of England, having undergone the necessary examinations, were admitted Licentiates in Midwifery, at the meeting of the Board on the 12th inst. :—Messrs. John Dixon, Hemsworth, Yorkshire, diploma of membership dated March 31, 1854; Charles Young, Worth, Sussex, July 12, 1850; Edward Towndrow France, Sheffield, April 24,

1854; Edward Wadman Ward, Leeds, April 21, 1854; William Henry Medd, Stockport, Cheshire, April 7, 1854; Chas. Vicary, Warminster, April 21, 1845; Charles Buckworth Herne Soame, Elstow, near Bedford, March 27, 1854; Daniel Benjamin Hine, Nottingham, April 17, 1854; Charles Muscroft, Pontefract, April 11, 1845; William Moxon, Rugeley, Staffordshire, June 2, 1854; John Gregory Booth, Haslingden, Lancashire, June 2, 1854; Edward Pratt, Appledore, Devon, April 11, 1853; William Deamer, Bentinck-street, Manchester-square, June 2, 1854; and Frederick Blackman, Blackfriars-road, April 21, 1854.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, July 6th, 1854.*

BROMLEY, FREDERICK, Bath.  
JOHNSTON, AUGUSTUS, Dublin.  
WARD, EDWARD WADMAN, Leeds.  
WILLIAMS, ISAAC MENNELL, York.

**WESTERN DISPENSARY FOR DISEASES OF THE EYE.**—Consulting Physician, Dr. Spurgin; Consulting Surgeon, Mr. C. Holthouse; Physician, Richard M. Lawrance; Surgeon, Mr. T. Hudson. A large and influential meeting of gentlemen, professional and otherwise, took place last week for the purpose of establishing the above-named Dispensary. The parishes of St. Marylebone and Paddington contain no institution for the treatment of diseases of the eye, and the want has been much felt for a long time. Occasion has been taken before to refer to the experiments made by Dr. Lawrance as to the effects of galvano-electricity on the opacities taking place in the structures of the eye. A sufficient number of individual instances of the disappearance of opacity of the cornea, and also of cataract, have occurred under the electrical treatment to warrant the introduction of this important agent. There seems little reason to doubt that when this power has the scope which a public institution alone can afford, yet more important results may be obtained. Specimens of the white of egg boiled hard were presented to the meeting, in which the whiteness and opacity were made to disappear entirely by electricity, leaving the substance firm and clear, and closely resembling the cornea in its healthy condition, but a little less condensed. The apparatus employed is merely the ordinary battery.

**HOMOEOPATHY FOR THE BIRMINGHAM HOSPITAL.**—An application has been made to the governors of the Birmingham General Hospital to allow the practice of homoeopathic medicine to be introduced into that institution. Surely the "infinitesimals" must have received encouragement from some parties who have a voice at the Hospital Board, or they would not have dared to take up such ground. The application has been renewed, we understand, more than once; and an assumed non-professional writer has taken up the cudgels for the *homos* in one of the local papers, basing his advocacy upon some "elegant extracts," carefully weeded from the now defunct *British and Foreign Medical Review*, and to which Sir John Forbes is made to stand father.

**DEATH OF MADAME SONTAG FROM CHOLERA.**—We regret to announce the death of this accomplished singer, at Mexico, on the 18th ult., from malignant cholera.

**KENT BENEVOLENT MEDICAL SOCIETY.**—On Wednesday, the annual meeting of this society, established in 1787, for the relief of widows and orphans of medical men, members thereof, was held at the Star Hotel, Maidstone, A. Martin, M.D., in the chair, supported by a full attendance of members. Mr. Friend, Hon. Sec., read the report, which spoke most favourably of the past proceedings, present position, and future prospects of the society. The receipts exceeded £700, the disbursements, including allowances to pensioners, the purchase of stock, and incidental expenses, left a large balance in the treasurer's hands; and the funded property in Three per Cents. Consols figured upwards of £6750. The sums granted to pensioners averaged between £40 and £50 each, and, on the whole, exceeded £270.

**THE MEDICAL OFFICERS OF GLASGOW AND THE SANITARY COMMITTEE.**—Last week, Dr. Glasse and Dr. Eadie, of Glasgow, presented a memorial to the Sanitary Committee for some extra remuneration on account of cholera. It appears that, as the disease was expected to be very virulent, several medical gentlemen were requested, should the unfortunate necessity arise, to keep open their places all night to supply medicines. This they agreed to do, but the cholera not re-

quiring them to remain open all night, the committee, with a canniness that deserves some notoriety, have declined to allow the medical men any extra remuneration whatever upon that account, notwithstanding the extra preparations which must have been made. The disease has abated, but a very virulent form of diarrhoea has since attacked the inhabitants.

**THE CHOLERA IN PARIS.**—On the 27th of June, *L'Union Médicale* stated that, from the 21st of June to the 25th, the number of cases in the hospitals were 36, 43, 44, (no return for the 24th,) and 51; among whom the deaths were 22, 17, 24, and 30. In town the deaths vary from 20 to 30 per diem. The numbers in public institutions from November, 1853, to June 25th, 1854, were as follows:—Cases treated in hospitals, 2767; recoveries, 1014; deaths, 1458; under treatment, 295.

**RECONSTITUTION OF THE BOARD OF HEALTH.**—The Public Health Act Amendment Bill, brought in by Lord Palmerston, has been printed. It reconstitutes the General Board of Health from the end of the present session (when the existing Act would expire), and continues it to the 31st of August, 1856; the board to consist of three members nominated by the Crown, and removable at pleasure, two of them receiving salaries not exceeding 1500*l.* (At present the salaries are, one of 1500*l.*, and one of 1200*l.*) The Home-Secretary is to direct which member shall be chairman, and the board is to obey all the directions and instructions of the Home-Secretary in the execution of its powers and duties. The board is to appoint, besides superintending inspectors and clerks, a secretary and assistant-secretary, as heretofore, and also a superintending medical-officer.

**THE CHOLERA AT CRONSTADT.**—This disease has broken out with great violence amongst the troops of the Russian army at Cronstadt.

**OUTBREAK OF CHOLERA ON BOARD AN EMIGRANT SHIP.**—Considerable apprehension has been caused at Liverpool, by the return of the ship, *Dirigo*, which left that port for Adelaide on the 6th instant. A child, aged nine months, had died on board before the vessel left the Mersey; and some hours afterwards a girl from Southampton was taken suddenly ill and died. This death was quickly followed by that of an infant, and on the third day the father of the girl from Southampton was seized with collapse, and died as suddenly as his daughter. It now became evident to the medical officers that cholera had simultaneously broken out all over the ship, and by their recommendation the master put into the port of Cork. At this time three young women lay dead on board, and nineteen passengers were in a state of confirmed cholera, while a great many persons were suffering from premonitory diarrhoea. Information was immediately conveyed to the Government Emigration-office, and prompt measures were adopted to effect the speedy removal of those emigrants who had escaped the contagion. The *Dirigo* was anchored in the Sloyne, and about 300 passengers were removed to the emigration dépôt at Birkenhead. Of these several have since died. Before the vessel reached Liverpool, forty-one deaths had occurred, while many of the passengers were suffering severely from premonitory symptoms. On Sunday evening seventeen bodies were thrown overboard, and after the arrival of the vessel on Monday night, seven bodies were carried ashore in coffins. On Wednesday, the 12th inst., fourteen cases were reported "dangerous" on board. When all the emigrants have been removed, the vessel will be thoroughly cleansed and fumigated.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, JULY 8th.**—The present return affords very satisfactory evidence of an improved state of the public health; the mortality which has been long above the average having fallen last week below it. The number of deaths registered in London last week was 984. In the ten corresponding weeks of the years 1844-53 the average number was 951, which, if raised in proportion to increase of population, becomes 1046. Last week's registration, therefore, exhibits a number less by 62 than the calculated amount. Zymotic diseases produced last week collectively 253 deaths, which is near the amount that may be expected at this season. Scarlatina declined from 72 in the previous week to 55 in the last; fatal cases referred to typhus were in the two weeks respectively 47 and 44, those referred to measles were 22 and 27, those to whooping-cough 35 and 39, those to diarrhoea 25 and 32. It requires notice that a death from hydrophobia was registered in the previous week, and that another was registered last week.

Last week the births of 752 boys and 718 girls, in all 1470 children, were registered in London. In the nine corresponding weeks of the years 1845-53 the average number was 1380.

At the Royal Observatory, Greenwich, the mean height of

the barometer in the week was 29.618 in.; the mean reading on Sunday was 29.815 in. The mean temperature of the week was 56.9°, which is 5.1° below the average of the same week in 38 years. The mean daily temperature was below the average on every day of the week; on Wednesday, Thursday, and Friday it was about 7° below it.

### Obituary.

At Gloucester-place, deeply regretted by a large circle of friends, ANDREW TREVOR, Esq., F.R.C.S., aged eighty-three, formerly surgeon to the 33rd Regt.

At Belmont, near Shrewsbury, Salop, on the 26th inst., MR. GEORGE PHILLIP GILL, surgeon, in his forty-fourth year. The deceased gentleman was surgeon to the Shrewsbury Dispensary, and a member of the Provincial Medical and Surgical Association.

On the 29th inst., at the residence of his cousin, Hopton Villa, Lewisham-road, in the fifty-seventh year of his age, J. HOPE, Esq., surgeon, for some years past, of the island of Tobago.

At Weisbaden, Dr. GERGENS, whose death is much deplored by his family, a large circle of friends, and the poor, whose friend he was in the hour of illness.

M. FABRE, the well-known editor of the *Gazette des Hôpitaux*, who for many years enjoyed the reputation of the most spirited medical journalist of Paris, has just died, at the age of fifty-seven years.

### BOOKS RECEIVED FOR REVIEW.

Dr. A. B. Granville on Sudden Death.

Dr. William Gairdner on Gout: Its History, Cause, and Cure. Third Edition.

Dr. Spencer Thompson's Wanderings among the Wild Flowers.

Mr. Samuel Parkes' Catechism of Chemistry. Revised by Dr. William Barker.

The Asylum Journal.

The American Journal of Insanity.

The Ceylon Miscellany.

The North-Western Medical and Surgical Journal.

For 7 lines and under.....	£0 4 6	For half a page .....	£2 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... ..	£1 14 8
Six Months... ..	0 17 4
Three Months ... ..	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 423, Strand, London, and made payable to him at the Strand Post Office.

### TO CORRESPONDENTS.

Sir John Forbes has requested us to correct an error in the notice respecting his Scheme of a Medical Bill. It is there stated (and reflected on) that two councils are assigned to Scotland, and only one to England and Ireland, respectively. It is presumed that this statement originated in a mere slip of the pen, the word "councils" being used instead of "examination boards;" still, as the error might mislead, it may as well be noticed.

Mr. C. A. Lorenz is thanked. The case shall be considered.

A Subscriber of Ten Years.—The matter shall be inquired into, and the list published.

Nemo.—No case of the kind has ever occurred.

Amicus.—Inadmissible.

Juvenis.—Many names are mentioned without sufficient reason. Those mentioned by our correspondent come under this category.

M.D.—The request shall be complied with.

Mr. J. J. Morewood.—Though there can be no doubt of the value of the suggestions which have been sent to 111 members of Parliament, we cannot at the present moment find space to discuss the matters to which they refer.

Mr. E. F. Fussell.—It is probable that the request of our correspondent may in a short time be complied with.

Z. E. C.—There is much truth in the communication forwarded to us, and we shall endeavour to find space for its insertion in an early number of *THE LANCET*.

Mr. Alfred Ebsworth.—It will be perceived, by reference to our columns, that the committee on Poor-Law Medical Relief have made their report. Though far from satisfactory, it must be remembered that the majority of the committee were pledged by official connexion, past or present, to uphold the present system. It is to be regretted that our able correspondent was not examined before the committee, as some of the suggestions which he makes are certainly deserving of serious consideration. An opportunity will, we trust, be offered to him to make those suggestions. The urgent demands upon our space do not always enable us to publish the communications we receive; but we trust to be able soon to place Mr. Ebsworth's views before the profession.

Mr. W. Adams is thanked for his communication.

A Governor of the Royal South Hants Infirmary.—It is impossible to arrive at a satisfactory opinion with respect to the merits of the two candidates. Whilst family, money, or other influences of an improper character are at work, it is not likely that the best men will be elected to our public offices. Mere testimonials go for nothing. It is only by *concours* that merit can be tested. Both the gentlemen who contested the office are known to us, and we should not feel justified in giving a positive opinion as to their relative merits.

Mr. Silwell.—Though favourable to the early closing movement of chemists and druggists, we are unable to find room for Mr. Silwell's communication. Vaccinator.—Under the amended Act, surgeons, not appointed by the guardians, are entitled to the munificent sum of one shilling for every case of successful vaccination. Nothing could be more offensive and insulting to the profession than the award of such a beggarly fee to an educated gentleman. Philanthropy is an easy and perhaps a pleasant pursuit to some, when it is exercised at the expense of others.

A Student.—So long as the Admiralty chooses to treat our brethren with insolence and contempt, so long shall we advise them not to enter the naval service. No man, with a proper regard for his own honour, or that of the profession to which he belongs, would consent, under the present system, to become an assistant-surgeon in the navy.

Senex.—Cases of the kind are not uncommon. Consult a respectable surgeon in your own neighbourhood.

M.E.C.S. (Birmingham) is thanked for his communication. We are only astonished that the respectable and influential society named should even notice that trashy print. The sum mentioned was more than enough if it were a payment for all the numbers that ever were published.

A. B.—In the year 1834.

W. L. D.—Twenty guineas would be a reasonable charge.

Hudibras, (Edinburgh).—It is impossible to form an opinion on the subject. The young gentleman, notwithstanding his objections, had better pass the examination.

An Old Reader.—We believe that both the Universities of Aberdeen and of St. Andrew's are held in equally good estimation. The mere possession of the diploma of these Universities does not entitle to examination at the College of Physicians of London for the extra licence.

Surgeon.—The circular sent is a trumpety puff.

Juvenis, (Stockport).—There is no fixed salary for a surgeon to an emigrant ship. Usually the remuneration is miserably inadequate. The duties of the surgeon are onerous. Further particulars may be obtained from an emigration agent.

Subscriber.—The *ad eundem* membership of the College of Surgeons is the admission of a member of another College of Surgeons without examination. For instance, a member of the College of Surgeons of Ireland would be admitted by the Council of the English College on the payment of ten guineas, and with proper recommendation.

A Graduate of the University of Cambridge.—We fear that the publication of the letter of our correspondent would tend to bring the profession into disrepute. There are different ways of advertising. The public ought to discern between the legitimate practitioner and the quack.

ERRATA.—In our journal of the 8th instant, in the Pass-list of the Royal College of Surgeons, for "William Henry England, Leeds," read "William Henry England, Leeds."—In the Report of the case of Strangulated Hernia, treated by Mr. Erichsen, inserted in last week's "Mirror," the dresser's name should be John Burn, and not "Brown."

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Willshire; Dr. Marris Wilson; Dr. Robinson, (Newcastle-upon-Tyne); Sir John Forbes; Mr. E. F. Fussell, (Chislehurst); Mr. E. Hearn, (Southampton); A Subscriber of Ten Years, (Liverpool); Reform; Amicus; Nemo; Mr. C. Vaudin, (Jersey); Mr. H. L. Stewart, (Douglas); Secretary of Belfast District Hospital for the Insane; Surgeon; A Graduate of the University of Cambridge; An Old Reader; Mr. Stewart, (Isle of Man, second communication); Mr. P. Williams, (President of North Wales Branch of the Provincial Medical and Surgical Association); Mr. Moat, (St. Thomas's Hospital); Mr. James Jago; Subscriber; An Experienced Dispenser; M.R.C.S., (Birmingham); Juvenis; Mr. J. Horsley, (Cheltenham); Mr. Wallis; L. R. C.; Mr. Alfred Ebsworth; Mr. W. Adams; Hudibras; Mr. A. Holbrow, (Stonehouse, with enclosure); Mr. W. F. Grueber, (Letterkenny, with enclosure); Mr. B. Scott, (Newport, with enclosure); Mr. A. Gabb, (with enclosure); Mr. J. D. Baker, (Wragby, with enclosure); Dr. Crabb, (Poole, with enclosure); Mr. G. F. Linney, (Pontefract); Mr. C. A. Lorenz; Mr. J. J. Morewood; Mr. Silwell; Senex; A Governor of the Royal South Hants Infirmary; Vaccinator; A Student; A. B.; W. L. D.; M.D.; &c. &c.

# CAUTION.

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

Mr. Bourjeaurd, in submitting the above four Engravings as illustrating the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaurd wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spiral Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

## Stiff Stays Superseded by

WHITTAKER'S ELASTIC BODICE; Elegance of Figure is obtained all Pulmonary Complaints prevented; Fastening in Front; worn by ladies of rank. Price 10s. to 20s. Waist, Riding, and Accouchement Belts. Prospectus and self-measurement paper sent on receipt of a stamp.

Mesdames A. and F. WHITTAKER, 5, Gerrard-street, Soho, opposite Rimmel's, Perfumer.

## The Loss of an Eye

no longer forms an obstacle in the career of persons thus afflicted, since the expression and movements of Mr. BOISSONNEAU'S ARTIFICIAL EYES completely restore the physiognomy. The patient may apply them himself, without any previous operation, and without experiencing the least pain—even children do not complain. The Department of Artificial Eyes in the London and Paris Hospitals having been entrusted to him by Royal, Ministerial, and Administrative decisions, his method of appropriation has been adopted in them for many years.

The next visit to England will be for London only, 8, South-crescent, Bedford-square, the 25th, 26th, and 27th of July.

## Mr. Bourjeaurd's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

FIG. 1.—MR. BOURJEAURD'S NEW SUSPENSORY BANDAGE, as applied to a patient.—Mr. Bourjeaurd begs to state that the bag supporting the scrotum is made of a delicate webbing of silk and india-rubber; the bands running round the thighs consist of the most yielding elastic tissue, and will stretch to twice their length; a third band is adapted to the upper part of the leg, the former being intended to be fastened to the flannel waistcoat of the patient. The scrotum is thus kept raised and fixed *in situ*, without distressing the organ in the least, the suspensor allowing of the most varied movements of the body.

FIG. 2.—The same Suspensory Bandage taken off.

## New Urethrotome, by Mr. Ure,

Surgeon of St. Mary's Hospital, described in THE LANCET of June 10th, —Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

## Hooper's Waterproof Sheetting, for

protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

Mr. HOOPER has succeeded in obtaining Waterproof Sheetting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

HOOPER, Pall Mall East, and Grosvenor-street, London.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

CUSHIONS FOR BED-SORES! —Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JON. PEREIRA, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852. Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon,

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

**ELECTRICITY**

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis or by post for Two Stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 5s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of CHOLERA the continuous current from the colon to the liver has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.)

103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.) Prospectus gratis, or by post for two stamps.

**John Harvey, Nephew and Successor**

to the late Mr. ANDREW SPRINGWEILER, No. 2, Duke-street, Smithfield, London, Medicine Chest and Dressing Case Maker. Ship Medicine Chests according to Act of Parliament. Emigrant Chests, &c., for all Climates.

Chemical and Plate Chests, Toilette, Jewel, Liqueur, and Sample Cases, Writing Desks, Despatch Boxes, &c., &c.

Wholesale and for Exportation.—Warranted to stand any Climate.

J. H., in soliciting of the medical profession and the trade generally a continuance of the liberal patronage enjoyed for so long a period by his late uncle, begs to inform them that the firm of Springweiler and Thompson (which existed in name only) was dissolved nearly two years prior to Mr. Springweiler's death, and that J. H., as successor and executor of the deceased, continues to carry on the business at the premises occupied for so many years by Mr. Springweiler.

**India-rubber Urinals for Male and FEMALE RAILWAY TRAVELLERS AND INVALIDS.**

No. 1.

No. 2.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

URINAL FOR BED USE.  
Price 15s., 18s., and 21s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

**Asthma, Chest, and Throat Affec-**

**TIONS.**—Immediate Relief and Effectual Cure by Markwick's Patent 2s. 6d. Respirator, Chest Protector, &c.

**GOUT, RHEUMATISM, and LUMBAGO.**—For a speedy Cure, use Markwick's Patent Piline Gout Socks and Gloves, Knee and Shoulder Caps, Lumbago Bands, &c.

**SHOE SOCKS,** of Markwick's Patent Piline, surpass every other for comfort; being waterproof, you are also protected against damp.

**MARKWICK'S PATENT SPONGIO-PILINE POULTICE or FOMENTATION,** is invaluable for its extraordinary efficacy, easy application, cleanliness, and durability.

G. TRIMBLEY, sole Manufacturer, Queen-street, Cheapside, London. Sold retail by all respectable Chemists and Druggists.

**Teeth.—Mr. Alfred Jones, of Gros-**

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Teeth—By Her Majesty's Royal**

Letters Patent.—Newly-invented and Patented application of Chemically-prepared White India-rubber in the construction of Artificial Teeth, Gums, and Palates.—Mr. EPHRAIM MOSELY, Surgeon-Dentist, 61, Grosvenor-street, Grosvenor-square, sole Inventor and Patentee.—A new, original, and valuable invention, consisting in the adaptation, with the most absolute perfection and success, of CHEMICALLY-PREPARED WHITE INDIA-RUBBER as a lining to the ordinary gold or bone frame. The extraordinary results of this application may be briefly noted in a few of their most prominent features, as the following:—All sharp edges are avoided; no springs, wires, or fastenings are required; a greatly increased freedom of suction is supplied; a natural elasticity, hitherto wholly unattainable, and a fit perfected with the most unerring accuracy is secured; while, from the softness and flexibility of the agent employed, the greatest support is given to the adjoining teeth when loose, or rendered tender by the absorption of the gums. The acids of the mouth exert no agency on the chemically-prepared white India-rubber, and, as it is a non-conductor, fluids of any temperature may with thorough comfort be imbibed and retained in the mouth, all unpleasantness of smell or taste being at the same time wholly provided against by the peculiar nature of its preparation. To be obtained only at 61, Grosvenor-street, London; 22, Gay-street, Bath; 34, Grainger-street, Newcastle-on-Tyne.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

**Important Saving, by Pre-payment,**

in the PURCHASE of NEW WHITE MOULDED VIALS.

APSELY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., and 1 1/2 oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSELY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**Warming and Ventilating by Hot**

AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Eardiston House Worcestershire, March 1st, 1854.

Sir,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising, I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Boileve, Esq.

WM. SMITH. (Sir, Baronet.)

**Purification of Linen—Prevention of**

Disease.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

Sir,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1853, by Mr. Boileve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy; I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

J. Boileve, Esq.

I am, Sir, your obedient servant,  
J. FALFREEMAN, House Steward.

## Caution!—Messrs. Allsopp and Sons

find it necessary to caution the Public, and especially Shippers of their Ales to the Colonies, against frauds committed by parties in selling spurious Ales for those of Messrs. ALLSOPP & SONS.

Messrs. ALLSOPP & SONS have felt compelled, by the extent to which this disgraceful practice has been carried, to proceed, in several cases, by obtaining Injunctions from the Court of Chancery; and have ultimately been driven to prosecute criminally, for the commission of this offence. They beg to call attention to the case of "THE QUEEN v. GRAY & GOSLIN," in which Lord Campbell sentenced the parties charged to TWELVE MONTHS' IMPRISONMENT WITH HARD LABOUR.—*See Times and Morning Advertiser of the 18th May.*

Messrs. ALLSOPP & SONS will thank all persons having reason to doubt the genuineness of any article sold under their name, to send them the earliest information, in order that immediate steps may be taken for prosecuting the parties.

Messrs. ALLSOPP & SONS will be happy to furnish the names of respectable houses, where a supply of their Ales may be depended on, as genuine from the Brewery.

Brewery, Burton-on-Trent.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## Malt Tax—addition of 50 per cent.

BASS'S EAST INDIA PALE ALE.

BERRY BROS. & CO. take the liberty of announcing that they have now on hand, in Cask and Bottle, an ample supply of BASS'S PALE ALE, with all its accustomed beauty of flavour and delicacy of colour, and WITHOUT ANY ADVANCE IN PRICE.

3, St. James's-street, London.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

## George Hanson's Sparkling Hop

CHAMPAGNE, Quarts 18s., Pints, 12s., Sparkling Nectar, 8s., bottles included; Hampers, 10s.

This new and exhilarating beverage, possessing the fine aroma and pure tonic properties of the Hop, with all the brilliancy of the foreign Champagne, stands unrivalled as a luncheon and dinner luxury. To Invalids it is invaluable, and can be taken without affecting the head—its habitual use assisting the digestion.

To Merchants and Captains it will be found an excellent article for Export—To Passengers in sea-sickness this restorative will be highly appreciated—it will be found a cool and refreshing drink at the Mess Table—and in Warm Climates most desirable.

G. H. has the greatest confidence in recommending the above, and the demand, which its excellence has created, is sufficient guarantee of its quality.

May be had at most of the Taverns and Refreshment Rooms in the neighbourhood of the Crystal Palace.

Sold Wholesale, Retail, and for Exportation, by the Manufacturer, GEORGE HANSON, 33, Clement's-lane, Lombard-street, City.

## Tobacco Smoking.—Tobacco Smoke

contains two very powerful poisons, which, when absorbed by the system, in ordinary smoking, produce many serious diseases destructive of the physical and mental health of the smoker.

PHILLIPS and CO.'S Patent Condensing and Filtering Pipes and Stems for Meerschaums are the only inventions known that permit of healthful smoking, and which the medical profession will find worthy of their notice as a valuable therapeutic agent in all cases where the smoking of tobacco and stramonium may be desirable.

Read the Smoker's Friend, or the Philosophy of Smoking, which may be had gratis of all Phillips and Co.'s agents, and also of the Patentees and Manufacturers, 9, Lyon-street, Caledonian-road, Islington, London, who will send them post free to all applicants.

A Pipe or Stem sent post free, price 2s. each, or two for 3s. 6d.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSSE and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## Do you Bruise your Oats yet?—

MARY WEDLAKE'S Oat-bruizers, £2 15s. 6d.; ditto, £4 15s. 6d. Chaff-cutters, £3 7s. 6d.; ditto, £4 10s. 6d. Domestic Flour-mills, for home use, £4 10s. 6d.—A saving on Oats of 35 per cent. Terms Cash.

118, Fenchurch-street, London.

No one can equal them for cheapness or durability. Ten thousand have found their way into the most eminent horse-masters' stables, particularly by medical men, with unexpected advantage to the owners.

Book on Feeding, 1s.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Griddles, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## Rice Harris and Son, Islington

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroys the effluvia and smoke, which have hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham, and at Mr. JOHN SHORTER'S, Crispin-street, Spitalfields, London.

## Metcalfe and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

## Novelty in Bedsteads, adapted for

the Nursery, Sick Chamber, Sitting-room, and Drawing-room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattress complete, 35s.—the most complete article ever introduced to the public.

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

## Gold Chains and Jewellery.—

WATHERSTON and BROGDEN'S GOLD CHAINS, by troy weight, at realizable value, and the workmanship at wholesale manufacturers' prices.

EXAMPLE.

Intrinsic value of a chain of 15 carat gold, weighing 1½ oz. ... £3 19 7

Supposing the workmanship to be ... .. 2 0 0

Total ... .. 5 19 7

By this arrangement the public will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery, of the first quality, all made at their manufactory, 16, Henrietta-street, Covent-garden, London.

Established A.D. 1798.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Blake's Aërated Citrate of Potash

WATER.—BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, have recently prepared an Aërated Solution of Citrate of Potash, which they beg to introduce to those members of the profession who may desire it for the use of their patients. It will be found a valuable auxiliary in the treatment of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicarbonate in each bottle; Soda, 15 grains; Magnesia, 12 grains; and Ammonia, 10 grains. Seltzer, Vichy, and other foreign waters, from the respective analyses.

## Schweppe's Soda, Potass, and Mag-

NESIA WATERS, and AERATED LEMONADE, continue to be manufactured upon the largest scale at their several establishments in London, Liverpool, Bristol, and Derby. The celebrity of these well-known waters, and the preference they universally command, are evidences that their original superior quality over all others is well sustained. Every bottle is protected by a label with the name of their firm, without which none is genuine, and it may be had of nearly all respectable chemists throughout the kingdom. Importers of the German Seltzer Water, direct from the springs, as for the last twenty years.—51, Berners-street, London.

## Dr. Kahn's Museum, (top of Hay-

market), Piccadilly, consisting of 800 Anatomical Wax Models, open Daily; Lectures by Dr. SAXTON, F.R.G.S., and F.R.S.—Admission, One Shilling. Dr. KAHN executes all descriptions of Anatomical Wax Figures, on the shortest notice, and the most reasonable charges.

## Matrimonial Institution.—Founded

1848.—Offices: 13, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success), as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CURBURY, 13, John-street, Adelphi, London.

## Insanity, Nervous Debility, &c.—

The Medical Profession and the Friends of the afflicted are respectfully informed that they can be immediately supplied with attendants, male or female, of undoubted skill, experience, and respectability, on application to the LISSON-GROVE ASSOCIATION OF ATTENDANTS ON PERSONS BODILY OR MENTALLY AFFLICTED.—All communications to Mr. R. GODDARD, Chemist, (Honorary Secretary), 63, Lisson-grove North, Marylebone, will meet with immediate attention, and by whom ample testimonials can be offered in favour of the Members belonging to the above Association. Established August 1st, 1840.

## Education for Idiots.—Rook Nest,

situate in a picturesque and healthy country, about two miles from Wakefield, is licensed for the reception of a limited number of Imbecile Persons and Children of Weak Intellect, of the upper and middle classes of society, of both sexes, requiring parental care and mental cultivation.

This Establishment is under the management of Dr. ATKINSON, one of the physicians to the Wakefield Dispensary and Clayton Hospital; and Mr. WILKINSON, the successful founder of Infant Schools, assists in carrying out those methods of education which have of late years been found so remarkably effective in developing the mind of individuals of limited intellect.

Further information and references can be obtained on application to Dr. Atkinson, South-parade, Wakefield.

## Case of Extreme Distress.—The

Rev. THOMAS GERARD FERRAND, Rector of Tunstall, Woodbridge, ventures to appeal to the Medical Profession, and to a benevolent Public, in behalf of the Widow and three Children of the late Mr. MILES RUDLAND, Surgeon and Apothecary, lately residing in Tunstall, who died on the 20th of June, leaving his family in the utmost destitution. The circumstances of this most distressing case are well known, not only to the Rev. T. G. Ferrand, but also to J. G. Sheppard, Esq., of the High House, Campeen-Ash; to the Rev. Jermyn Pratt, Rector of Campeen-Ash; to W. Muriel, Esq., Surgeon, Wickham-Market; and to many others of the medical profession residing in the neighbourhood, but are too numerous to insert in an advertisement. The case is one of utter destitution, and unless a benevolent and Christian public respond to this urgent appeal, there is no alternative for this distressed family but one too painful to contemplate.

Any Donations will be most thankfully received by the Rev. T. G. Ferrand, either direct, or through his Bankers, Messrs. Alexanders and Co., of Woodbridge; and also by W. Muriel, Esq., of Wickham-Market.

Subscriptions already received:—

Rev. T. G. Ferrand ...	£4	0	0
J. G. Sheppard, Esq. ...	5	0	0
Rev. James Williams ...	5	0	0
Dr. Beck ...	1	1	0
G. Cochrane, Esq. ...	1	0	0
Rev. J. Pratt ...	1	0	0
Dr. Mayne ...	0	10	0
Mr. J. Flatt ...	1	0	0
And various small sums, amounting to about ...	1	10	0

## Apothecaries' Hall—College of Sur-

geons.—Dr. STEGGALL continues to assist gentlemen in their studies, preparatory to Examination at the Royal College of Surgeons, College of Surgeons, Apothecaries' Hall, St. Andrew's, Aberdeen, &c., either in class or separately.—For terms, apply before One, and after Three o'clock, daily, at 2, Southampton-street, Bloomsbury-square.

## Loughborough Dispensary.—

Wanted, a RESIDENT HOUSE SURGEON and APOTHECARY to the above Institution. He must be a Member of the Royal College of Surgeons, and Licentiate of the Apothecaries' Company. The salary is £80 per annum, with furnished apartments for a single man, coals, candles, and attendance. A compounder of medicines is provided at the expense of the Institution. Testimonials directed to Mr. Brock, Baxter-gate, Loughborough, to be sent in on or before the 2nd September next.

RICHARD MICKLINSON, Loughborough.

## School of Anatomy and Medicine,

adjoining St. George's Hospital.—The WINTER SESSION will Commence on Monday, the 2nd of October, 1854.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by Mr. Lane.

Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.

Practical Anatomy—Mr. Blenkins and Dr. Deville.

Chemistry—Mr. J. E. D. Rodgers.

Medicine—Dr. Cornsack and Dr. Ballard.

Surgery—Mr. Pilcher and Mr. Spencer Wells.

Midwifery—Mr. Bloxam.

Materia Medica—Dr. Ballard.

Forensic Medicine—Dr. B. W. Richardson.

Botany—Dr. Lankester.

Practical Chemistry—Mr. J. E. D. Rodgers.

Comparative Anatomy and Zoology—Mr. R. T. Hulme.

For further particulars, apply to Dr. Lankester, 23, Old Burlington-street, or at the School, 1, Grosvenor-place.

## St. Mary's Hospital Medical School.

The Medical School at St. Mary's Hospital will be opened on Monday, the 2nd of October, at Two P.M., with an Introductory Address, to be delivered by Dr. ALDERSON, F.R.S., in the Anatomical Theatre of the School.

The following Lecturers are already appointed to the respective chairs:—

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones, F.R.S.

Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.

Pathological Anatomy—Dr. Markham.

Principles and Practice of Medicine—Dr. Chambers and Dr. Sibson, F.R.S.

Principles and Practice of Surgery—Mr. Coulson and Mr. Spencer Smith.

Clinical Medicine—Dr. Alderson, F.R.S.

Clinical Surgery—Mr. Ure.

Botany—Dr. J. S. Burdon Sanderson.

Materia Medica and Therapeutics—Dr. Sieveking.

Midwifery and the Diseases of Women and Children—Dr. Tyler Smith

and Mr. I. Baker Brown.

Medical Jurisprudence—Mr. Ansell.

Military Surgery, &c.—James Bird, M.D., F.R.C.S.

Ophthalmic Surgery—Mr. White Cooper.

Aural Surgery—Mr. Toynbee, F.R.S.

Dental Surgery—Mr. Nasmyth.

A detailed Prospectus will be shortly issued. Further particulars may be obtained by application to the Dean of the Medical School at the Hospital.

St. Mary's Hospital,

July 10th, 1854.

H. SPENCER SMITH,

Dean of the School.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology and General and Morbid Anatomy—Professors W. Bowman,

F.R.S., and Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D., F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and

Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will

commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854.

R. W. JELLY, D.D., Principal.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**Price 200 guineas, an ample Intro-**

duction to an old established GENERAL PRACTICE, yielding £300 a year, and almost entirely confined to a small market-town, pleasantly and conveniently situated within 100 miles from London. The surrounding district being rich and populous, and one gentleman only in opposition, there is every scope for a Successor with health and energy.

Apply to Messrs. LANE and LARA, 14, John-street, Adelphi.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**Medical Practice for Disposal in the**

country on very advantageous terms, the proprietor leaving on account of ill-health. A large house, suited for an establishment, may be had, if required.—Address to M. D., 32, Belitha Villas, Islington.

**Wanted, an Assistant, in a Country**

and Mining District, to Dispense, attend Midwifery, and the usual routine of Practice.—Qualification not requisite.—For particulars, address Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, London.

**Medical Assistant.—A Gentleman**

thoroughly versed in the duties of a Medical Assistant would be glad to meet with an Engagement in the country from the present time to the beginning of October. He is enabled to produce the highest testimonials as to ability and moral character, and would make the amount of salary a secondary consideration.—Address, N. B., Messrs. Gale, Baker, and Co., Bouverie-street, Fleet-street, London.

**A young Gentleman, who has been**

four years engaged in Country Practice, and has completed his first year at a Metropolitan Hospital, is open to an Engagement for August and September, in town or country, to Visit, Dispense, and attend Midwifery. Satisfactory references given.—Address, A. X., Messrs. Gale, Baker, and Co., Bouverie-street, Fleet-street, London.  
July, 1854.

MEDICAL.

**Wanted, by a married gentleman,**

aged twenty-seven, a Situation as Out-door Visiting and Dispensing ASSISTANT. The advertiser has had considerable experience in Obstetric, Club, and Private Practice; a rural district preferred. The highest Testimonials can be produced.—Apply by letter to A. B., care of Mr. Walker, 66, Liverpool-street, King's-cross, London.

**Mr. Wilkins, residing at Bedford**

Cottage, Walker, Kent, receives PUPILS, to prepare for the Public Schools. During the ensuing vacation (from July 22nd to September 11th), or earlier, he will be happy to take charge of three or four little Boys requiring Sea Air and Bathing. The House is surrounded by a large Garden, and is within a short walk of the Beach.

**Exchange of Sons.—A Surgeon,**

residing near Leeds, wishes to place his Son, aged twelve, in a family residing in London, to attend the School of University College; and would receive the Son or Daughter of a gentleman for the same period, who, from any cause, requires country air and medical care. The highest London references given and required.—Address M. D., 68, Camp-road, Leeds, Yorkshire.

**Partnership required in a Good**

General Practice where the receipts are not less than £1200 per annum, by a gentleman, aged twenty-six, M.D., M.R.C.S., of considerable experience in both Town and Country Practice, W. or S.W. suburbs, or within twenty miles of London, preferred. No objection to purchase the whole, with an extended introduction.—Address, F. G., M.D., Messrs. Westwoods and Hopkins, 16, Newgate-street, London.

TO MEDICAL ASSISTANTS.

**Wanted, with a view to a Partner-**

ship, a gentleman, unmarried, and with the double qualification, to assist the advertiser in the country, and reside in his house. As the Practice is of a first-class order, and capable of considerable increase, applicants must be of unquestionable character and gentlemanly address.—Applications, stating age, experience, and references, and whether willing to compound, (if required,) and what salary expected, to be sent (post-paid) to Y. Z., Post-office, Sea-side, Eastbourn, Sussex.—N.B. No answer will be returned, where no engagement is likely to ensue. The advertiser seeks assistance on account of his age.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**A Practice in the West Riding of**

Yorkshire for disposal.—The extensive PRACTICE of a deceased General Practitioner, residing in a populous manufacturing town in the West Riding, is for disposal on advantageous terms.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

**A Gentleman is open for immediate**

Re-engagement, with reference to a situation as ASSISTANT, to Visit, Dispense, and attend Midwifery, either in town or country.—Address, Thos. Colby, 11, North-place, Kingsland-road, near London.

**Wanted, in August, by a Gentleman**

aged nineteen, who will have completed his first Winter and Summer Session, a Situation to Visit, Dispense, and attend Midwifery. Satisfactory testimonials.—Address, N. N., Giltspur-street Lodge, St. Bartholomew's Hospital.

**Medical Assistant.—Wanted, by a**

gentleman, twenty-nine years of age, a SITUATION with a General Practitioner in town or country; he has been engaged in the profession fourteen years, has attended about 800 cases of midwifery, and can produce the most unexceptional testimonials as to character and abilities.—Address, A. Z., Post-office, Melton Mowbray.

**Wanted, an Engagement as Visiting**

ASSISTANT to a Medical Practitioner in town or country. The Advertiser has not previously acted as Assistant, but is accustomed to General, Midwifery, and Dispensing practices; age twenty-four; possesses the Degree and Diploma of Edinburgh; References satisfactory. Has no objection to go abroad as Ship-surgeon, or otherwise.—Address, M. R., 2, Belgrave-street South, Pimlico, London.

MEDICAL.

**For immediate Disposal, for a small**

sum, a bonâ fide PRACTICE, with Retail and Counter-prescribing, at the West-end,—parted with on account of the proprietor having obtained an Appointment, and being obliged to relinquish General Practice, from an accident received some years ago.—Address, Medicus, Mr. Chalmers Barron, Harvey and Co., Giltspur-street, City.

**A Surgeon in General Practice,**

residing in the country, is in immediate want of an active ASSISTANT to Visit, Dispense and attend Midwifery. The Advertiser will not engage the services of a gentleman, unless he is thoroughly competent, likely to remain, and able to produce the most satisfactory testimonials as to character and ability. Salary, £50 per annum.—Applications, stating age, reference, &c., to be addressed to M. R. C. S., Post-office, Wallingford, Berks.

MEDICAL.

**For Disposal, a General Medical**

PRACTICE in the Country, consisting of Union, Club, and Private Practice; receipts exceeding £300 per annum. It is situated in a wealthy agricultural district. This Practice is worth attention, as it is capable of considerable extension, and any reasonable arrangement would be made for the payment of the purchase-money, which is not required immediately. House and good garden, with or without eight acres of land.—Address, A. B. C., 19, St. George's Villas, Compton-road, Canonbury, London.

MEDICAL.

**A Surgeon in good Practice, residing**

in a healthy district within thirty miles of London, and of easy access, is willing to receive into his house an INVALID or SICK CHILD under sixteen years of age, requiring change of air and medical or surgical treatment. Terms moderate.—Address, M. D., Mr. T. D. Thomson, Bookseller, 13, Upper King-street, Russell-square.

**South Staffordshire General Hospital.**

—HOUSE-SURGEON.—The Vice-Presidents and Directors will proceed to the Election of a gentleman to fill the office of HOUSE-SURGEON to the South Staffordshire General Hospital, on TUESDAY, the 1st day of August next. Candidates must send in their Testimonials and Qualifications under cover, to the Secretary, on or before SATURDAY, the 22nd day of July next, in order that the same may be submitted to the Board for Examination. Candidates must be Members of the Royal College of Surgeons in London, and Licentiates of the Apothecaries' Company in London. They must be unmarried, and between twenty-five and forty years of age. The salary, which is permanent, will be £75 per annum, with Board, Washing, and suitable Apartments.

By order of the Weekly Board.

Wolverhampton, June 20, 1854.

BENJAMIN SMITH, Sec.

## Oleum Jecoris Aselli.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**Messrs. ANSAR, HARFORD, & Co.,** have the honour of informing the Medical Profession and the Public generally, that they have opened an Establishment at No. 77, STRAND, for the exclusive Sale of DR. DE JONGH'S COD-LIVER OIL, for which they have been appointed Sole Agents and Consignees in the United Kingdom and the British Possessions.

Whilst the marvellous effects of the Cod-liver Oil, and its superiority over every other remedy for the cure of Consumption, Asthma, Gout, Chronic Rheumatism, and all kinds of Scrofulous Complaints, are now too generally admitted by the most eminent practitioners to require any detailed exposition, a brief statement of the claims to public support of the peculiar preparation now first introduced into this country will naturally be looked for.

DR. DE JONGH, a Dutch physician of eminence, has, as it were, exclusively devoted himself, for upwards of fourteen years, to a series of scientific researches into the nature and properties of this inestimable medicine. His works, recording the results of his investigations, have been translated into most of the European languages; by universal admission, they are regarded by the Faculty as the standard authority upon the subject, and in addition to having obtained the spontaneous approval and the most flattering testimonials from some of the most eminent medical men and scientific chemists in Europe, including the names of BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, and FOUQUIER, they have been rewarded by his Majesty Leopold I., the King of the Belgians, with the large Gold Medal of Merit, and by his Majesty William II., the King of the Netherlands, with a Silver Medal, specially struck for the purpose.

DR. DE JONGH'S elaborate researches and practical observations have demonstrated the superior efficacy of the Light-brown Oil, which effects a cure in a much shorter time than the pale oil. His series of therapeutical experiments with the various kinds of Cod-liver Oil have invariably proved the light-brown to contain iodine, phosphate of chalk, volatile acid, and the elements of the bile,—imparting the colour to the Oil, and deemed amongst its most active and essential principles,—in larger quantities than the pale oil manufactured in England and Newfoundland, which by its mode of preparation is in a great measure deprived of these active principles.

So strikingly beneficial have been the results attending the use of the preparation to which DR. DE JONGH has awarded the preference, that in Holland and Germany, where this remedy has been prescribed for upwards of thirty years by the Faculty, for Rheumatism, Gout, and Scrofulous Diseases, and of late years with signal success for Consumption, the pale, or rather the yellow oil, in favour of which, owing to its long use and to its being considered in a very trifling degree more palatable, there existed a deep-rooted prejudice, is at present almost totally disused. In France and Italy, where its introduction is of more recent date, DR. DE JONGH'S Oil is already held in the highest repute amongst the most distinguished practitioners, and is in most extensive demand on the part of the public.

From every cask of Cod-liver Oil prepared according to DR. DE JONGH'S directions, a sample is taken, and submitted by him to the most careful chemical analysis prior to its being exposed for sale. By this means, the Faculty and the Public in general may rest assured of being able to procure the purest and most efficacious Cod-liver Oil; and this medicine, no longer exposed to the influence of accidental causes or foreign ingredients, capable of destroying, altering, or paralyzing its effects, will be able to assert its full rights, and maintain the ground it has so deservedly acquired.

A pamphlet, by DR. DE JONGH, with detailed remarks upon the superiority of the light-brown oil, directions for its use, cases in which it has been prescribed with the greatest effect, and testimonials, will be forwarded to medical practitioners gratis on application. The bottles containing the oil are labelled, and bear DR. DE JONGH'S stamp and signature, to which particular attention is requested. Directions for use accompany every bottle.

*The following are selected from some of the leading Medical and Scientific Testimonials in favour of  
DR. DE JONGH'S COD-LIVER OIL:—*

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

(Signed)

**DR. JUSTUS LIEBIG.**

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the author of the best analysis and investigations into the properties of this Oil should himself be the purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to

your application. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

**JONATHAN PEREIRA.**

"Finsbury-square, London, April 16, 1851.

"To Dr. de Jongh."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"DEAR SIR AND HONOURED COLLEAGUE,—I must begin by thanking you for your polite attention in sending me your works, and must furthermore openly acknowledge that you have rendered an eminent service to science, by acquainting practitioners with the cause of the frequent irregularity in the effects of the Cod-liver Oil, and directing their attention to a proper choice. You have thereby preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases. It is therefore with the greatest pleasure that I pay my tribute of well-merited praise to the successful efforts of the learned physician and chemist, whose researches after truth have cost him so many sacrifices, and who has shown us the way of rendering highly effectual the administration of one of the most powerful medicines we are acquainted with.

"Accept the assurance, most honoured colleague, of my sincere expression of gratitude and regard.

(Signed)

**FOUQUIER.**

"Paris, Nov. 12, 1847.

"To Dr. de Jongh at the Hague."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions; and by all respectable Chemists and vendors of Medicine in Town and Country, at the following prices:—

Allen's Registered Despatch-box and Writing-desk, their Travelling-bag (with the opening as large as the bag), and the new Portmanteau, containing four compartments, are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Furniture, and Military Outfitters, 18 and 22, Strand.

**Mayall's Daguerreotype Portrait**  
 GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS of EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

**H. Silverlock's Medical Label Ware-**  
 house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**Asthma, Chest, and Throat Affec-**  
 TIONS.—Immediate Relief and Effectual Cure by Markwick's Patent 2s. 6d. Respirator, Chest Protector, &c.

GOUT, RHEUMATISM, and LUMBAGO.—For a speedy Cure, use Markwick's Patent Piline Gout Socks and Gloves, Knee and Shoulder Caps, Lumbago Bands, &c.

SHOE SOCKS, of Markwick's Patent Piline, surpass every other for comfort; being waterproof, you are also protected against damp.

MARKWICK'S PATENT SPONGIO-PILINE POULTICE or FOMENTATION, is invaluable for its extraordinary efficacy, easy application, cleanliness, and durability.

G. TRIMBEY, sole Manufacturer, Queen-street, Cheapside, London. Sold retail by all respectable Chemists and Druggists.

TO SURGEONS.

**Messrs. Shoolbred & Bradshaw beg**  
 to call the attention of Medical Gentlemen to their PATENT ELASTIC STOCKINGS, KNEE-CAPS, SOCKS, &c. The particular property of the Stocking is to give constant support in varicose veins, weak, swollen, or dropsical affections of the leg, or in any case requiring constant and equal pressure. The Knee-Cap will be of great use where the knee-joint requires support from accident to the pan of the knee, after inflammation, rheumatic, or gouty affections. The Sock affords great support to the ankle-joint after fractures and dislocations, or in any case where, from weakness of the part, support may be necessary. Suffice it to say, wherever common bandages are necessary, the Patent Elastic Invention will beneficially supersede their application, as they yield an equally diffused pressure over the part affected.  
 To be had of the Patentees, 34, Jermyn-street, St. James's, London.

CALF-PIECE

**Bandages and**

TRUSSES.—Surgeons continue to recommend BAILEY'S ELASTIC STOCKINGS and KNEE-CAPS to draw on without the trouble of lacing. They give constant support, and may be cleaned if sent to the establishment. Every kind of Elastic Bandages and Trusses upon the most improved principle for the relief of the afflicted, and at prices suitable to all classes. The following articles kept ready made:—Crutches, Splints, Backboards, Exercise Belts for Children, Dumb Bells, Wooden Legs, &c. &c.—Address, WM. HUNTLY BAILEY, 418, Oxford-street, London. Established 25 years.

KNEE CAP

SOCK

Bells, Suspension Bandages, &c. &c.—Address, WM. HUNTLY BAILEY, 418, Oxford-street, London. Established 25 years.

**Teeth.—Mr. Alfred Jones, of Gros-**  
 venor-street; has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.

Originated in 1842.

## Recherche Wines! — First-growth

Wines only! At the following very reduced prices, on cash terms only:—

Sherry—"Amontillado and Montilla character." In Dock, at 252 per Butt, 226 per Hhd., 213 per Quarter Cask. Duty paid—£21 per Quarter Cask, £42 per Hhd., 284 per Butt, 42s. per dozen.

Port.—Very rare old Wines, 42s. and 54s. per dozen. Connoisseurs, who cannot suit their taste, except on rare occasions, are invited to try these Wines. Vintage Ports for laying down.

The qualities of Wines most prized being different, some preferring pale, others brown, some dry, some fruitiness and smoothness, all of which are consistent with purity, gentlemen are solicited to call and taste the Wines at Mr. HAMMICK'S Office, No. 11, Pall-mall, London.

First class! Champagne, Moselle, Hocks, Claret, Sauterne, &c., at the most moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples, with List of Prices, forwarded on application.

There being no credit on freights, neither on duties, and to buy in the best market, cash terms command every advantage, and are essentially requisite to obtain the best and purest Wines at the lowest possible prices.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

FOR EPILEPSY.

## Cotyledon Umbilicus.—The intro-

duction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter never used any but what he has obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidnitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22a, Henrietta-street, Cavendish-square.—N.B. Halls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Blake's Aërated Citrate of Potash

WATER.—BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, have recently prepared an Aërated Solution of Citrate of Potash, which they beg to introduce to those members of the profession who may desire it for the use of their patients. It will be found a valuable auxiliary in the treatment of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicarbonate in each bottle. Soda, 15 grains; Magnesia, 12 grains; and Ammonia, 10 grains. Seltzer, Vichy, and other foreign waters, from the respective analyses.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Aërated Waters, and Patentes of the Syphon Vase and Valvular Stopped Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyances complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking aërated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

## Briet's portable Gazogène, OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SELTZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler

PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN, and CO., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

## Cocoa-nut Fibre Matting and Mats,

of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 43, Ludgate-hill, London.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 23s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## To Professional Men and others.—

The Oxford Mixed Doeakin Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, four doors south of Soho-sbroad and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## A Thoroughly Good Fitting Garment

INDISPENSABLE.—To those who have been pestered with badly-cut garments, J. SANDS begs to state that, having had great experience in studying the human form, he will engage to fit the most difficult figure or please the most fastidious taste. In passing his Establishment, 17, HOLBORN HILL (opposite Furnival's Inn), it will be seen that every peculiarity of style is consulted, both in price and pattern. Dress and Frock Coats from 35s. to 70s.; Black Dress Waistcoats, from 8s. 6d.; and Trousers from 21s. Fancy Clothing and Juvenile Dresses in great variety.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON, the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

## Mr. Mechi wishes it to be clearly

understood that he CHARGES the SAME PRICES at the CRYSTAL PALACE as at Leadenhall-street: that his manufactures are varied to suit all classes. For instance, Dressing-cases at 25s., or at £180; Penknives at 1s. or 21s.; Tooth-brushes at 6d. or at 2s.; each article being good of its sort. Mr. Mechi's assistants at the Crystal Palace will attend constantly to receive orders and dispose of his manufactures there.—4, Leadenhall-street, June 20.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## The Royal Turkish Towels.—Under

the Patronage of her Majesty the Queen, and which received the Prize Medal at the Great Exhibition. The Brown Linen combines the advantages of a Flesh-brush with the qualities most desirable in a Towel; the white Cotton is the softest Towel ever made, and absorbs moisture without the necessity of using friction.

To be had of all respectable Linendrapers.

## Novelty in Bedsteads, adapted for

the Nursery, Sick Chamber, Sitting-room, and Drawing-room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattress complete, 35s.—the most complete article ever introduced to the public.

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

## Gold Chains and Jewellery.—

WATERSTON and BROGDEN return their grateful thanks to the nobility, gentry, and the inhabitants of Bristol and its vicinity, for the approval they have given, during the last eighteen months, to the principle sought to be established, of selling the "Gold in Chains at its intrinsic value," with the workmanship at a defined price, according to the intricacy or simplicity of the pattern.

WATERSTON and BROGDEN, encouraged by the liberal patronage they have received, have made large additions to their STOCK of GOLD CHAINS, which contains every variety of pattern that can be found in the trade, including many original designs which cannot be seen elsewhere; and they take the present opportunity of inviting visitors from the country to an inspection of their Manufactory, where may be seen, in addition to Gold Chains, an elegant assemblage of JEWELLERY of the best quality, in great variety, at manufacturers' prices.

Manufactory, 16, Henrietta-street, Covent-garden, London.

NEMO SIBI VIVAT.

 J. H. Whiteway, Esq., Lincoln's-inn-fields.

The Policies of this Office are a sure and safe provision for settlements, renewal of leases, security of debts, &c.

The Medical Attendant consulted as the Medical Adviser and Examiner of the Society, is awarded a fee of £2 2s., when the sum assured amounts to £250, and £1 1s. when under that sum. The Medical Practitioner also receives for business introduced by him the usual commission of ten per cent. on the first payment, and five per cent. on the payments of subsequent years.

The Society also claims the support of the Medical Profession on the following grounds:—

For several years the "Medical, Legal, and General" was the only MUTUAL Life Assurance Society connected with the Medical Profession.

The rates are lower than those of any other Medical Life Office.

Bonuses divided annually.

Persons desirous of assuring Diseased or Rejected Lives will find that from the experience acquired by this Society it is enabled to accept such lives at rates both equitable and safe.

From the outset the expenses of management have been kept within the narrowest limit, consistent with the efficient working of the establishment.

Loans, Annuities, Endowments, and every form of assurance contingent upon Life, transacted at moderate rates.

## ANNUAL PREMIUM FOR ASSURING £100 AT DEATH WITH PROFITS.

The objects of this Society are—

1st. To secure the more regular payment for professional services, and to adopt measures for the benefit and advancement of the general interests of medical men.

2nd. To negotiate the Transfer of Practices, Partnerships, and the providing of Assistants and Pupils.

Assistants are charged Two and Sixpence for registration.

3rd. To establish a fund for benevolent purposes.

Annual Subscription, One Guinea; a firm, consisting of two partners, a Guinea and a Half; a firm of three partners, Two Guineas. No unqualified person can be admitted a Member of the Society.

The Trustees and Committee are responsible for all moneys paid to the Society, and also for the integrity of their agents.

JOHN CAPES, Esq., Secretary-Superintendent.

# Shower and all Domestic Baths.—

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECURRENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

# Hooper's Inspissated Juice of Tarax-

ACUM, prepared by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—DR. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

INSPISSATED JUICE of COTYLEDON UMBILICUS, for Epilepsy, introduced by Mr. Salter, of Poole (see "Medical Gazette" of March 2nd and May 11th), for whom Mr. Hooper first prepared it, and has continued to do so, Mr. Salter finding it to possess the properties of the fresh juice.

The following remarks of the Rev. A. Leapingwell show the value of Taraxacum when properly prepared:—

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it.

"I remain, yours truly,

ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Sleaford.

BRIGHTON SELTZER WATER, 4s. per doz. Other fictitious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

## Clinical Lecture

ON  
A CASE OF

## TRAUMATIC CAROTID ANEURISM.

*Delivered Jan. 16th and March 27th, 1854, at the  
Toronto General Hospital, Canada,*By W. R. BEAUMONT, Esq., F.R.C.S. Eng.,  
LATE PROFESSOR OF SURGERY IN THE UNIVERSITY OF TORONTO.

GENTLEMEN,—The case to which I am about to call your attention is of so great importance in surgery, and of such exceedingly rare occurrence, that although out of office as a teacher, I am still unwilling that it should pass by without endeavouring to impress it on your minds. This is one reason which induces me again to give a clinical lecture; another reason is that I wish to explain to you the grounds on which I have adopted the treatment at present pursued, instead of risking the performance of an operation necessarily attended with the greatest difficulty and danger. The case you have, probably, all heard spoken of, as one of traumatic aneurism of the common carotid. Before, however, proceeding with the case, I will briefly explain, for those students who are not acquainted with the subject, the important commonly-existing differences between traumatic and spontaneous aneurisms. The term aneurism is usually applied to a sac, the interior of which communicates with the interior of an artery, and consequently receives arterial blood and pulsation at each contraction of the left ventricle of the heart. This condition always exists at an early stage of the disease, but may cease under certain curative changes. A traumatic aneurism, as its name implies, arises from the wound of an artery, and as the perforation of the vessel takes place from without, all the coats of the artery are divided, and therefore none of them can enter into the composition of the walls of the aneurismal sac, which are composed of condensed cellular tissue, and it may be of other tissues also, cut at the time the artery is wounded. A traumatic aneurism is termed circumscribed when its blood is contained in a small cavity not extending far from the immediate vicinity of the wounded artery, (which is the condition in the case I am about to read to you;) and an aneurism is termed diffused when its blood is contained in a larger cavity, which has gradually become increased in dimensions by the impulse of the blood, so as to extend from the wounded vessel among parts more remote from the vessel. That form of aneurism called spontaneous, is no doubt always preceded by some degeneration of the artery, unfitting it to resist the impulse given to the blood by the contractions of the left ventricle of the heart. In some few cases, ulceration perforates all the coats of an artery, and thereby may produce a false, and usually diffused, spontaneous aneurism. In other cases it has been found, though rarely, that all the coats of an artery remain entire, and become dilated into a sac or pouch, producing that which has been considered by some as alone constituting true aneurism. Of such dilatation of all the coats of an artery in cases of aneurism, examples have been recorded. Scarpa, however, who from his numerous dissections of aneurisms is one of the very highest authorities on this subject, stated, many years ago, that "aneurism, in whatever part of the body it is formed, and from whatever cause it arises, is never occasioned by the dilatation, but by the rupture or ulceration of the internal and middle coats of the artery, and consequently that these coats have not the smallest share in the formation of the aneurismal sac." It is only the outer elastic coat of arteries, composed of condensed cellular tissue, which, according to Scarpa, enters into the composition of the walls of the sac. He was no doubt wrong in the universality of his proposition, but only in its universality. Hodgson and Wardrop, who at a later period published esteemed works on the subject, both express a positive opinion that aneurism does sometimes commence by dilatation of all the coats of an artery, but that in such cases as the aneurismal sac enlarges, the inner coat or coats are ruptured, and consequently the rest of the sac is formed only of the outer cellular coat, or the contiguous parts, so that the lining membrane of the artery is continued from the artery only over the adjoining part of the sac. This partial extension of the polished lining membrane of the artery over the adjoining part of the sac, is very clearly seen in a preparation of a large aortic aneurism in the museum of the University of Toronto.

In traumatic aneurism, the formation of the aneurismal tumour is almost always more sudden than in spontaneous

aneurism, because, in the former, there is less resistance to the impulse of the blood, and consequently to the increase of the tumour, which minor degree of resistance in the sac of a traumatic aneurism is due to the absence of the outer elastic coat of the artery in the composition of the walls of the sac. This latter circumstance is of importance in regard to the treatment of the case I am about to detail to you, for in my opinion it forbids the performance of Brador's operation—i. e., the tying of the artery on the distal side of the aneurism, by which the impulse of the blood against the walls of the sac would be immediately increased; and if this augmented impulse of the blood should cause the walls of the sac to give way, a circumscribed aneurism would become converted into a diffused aneurism, or an extensive extravasation of blood, a condition far more unfavourable to the patient than that of a circumscribed aneurism.

I will now proceed with the case. The patient, Joseph S—, aged twenty, was admitted, under my care, into the Toronto General Hospital, on the 2nd of January, 1854. He had the appearance of a healthy subject, though reduced in flesh and strength by the large loss of blood which he had sustained. He stated that it was about eight weeks before his admission, between six and seven in the evening, that he had been stabbed in the neck, and in two or three other places, which had occurred suddenly, without any fight or struggle. Almost immediately after being stabbed he fell insensible, from the loss of blood, having walked, he thought, about twenty paces before falling. He remained unconscious, or nearly so, till the next morning, (i. e., for about twelve hours,) when, in the act of sneezing, a second hæmorrhage took place from the wound; to which adhesive plaster only had been applied the previous evening. His mother stated that he had lost so much blood, that at times during the night she thought he was dead. On the following morning, immediately after the second hæmorrhage, the edges of the wound were brought together by three points of suture; after which, there had been no further bleeding. He had observed no swelling in the neck before the suture was made, but on the same day a small, roundish swelling commenced at the seat of injury, which swelling had gradually increased in size up to the last few days. There had been no pain in the swelling, but throbbing had been present from its commencement.

On examination, a very prominent tumour was found on the left side of the neck, seated close to the clavicle, and extending transversely from the inner to the outer border of the sternocleidomastoid, having made its way through the cut fibres of the muscle. The tumour was distinctly circumscribed, somewhat conical in form, and circular at its base, which was about two inches in diameter. On the summit of the tumour was a stretched and thin cicatrix, about one inch and a quarter long by half an inch broad. The direction of the long diameter of the cicatrix was oblique, and rather nearer to a horizontal than to a vertical line. We do not know the weapon with which the wound was made, nor do we know whether its point was directed horizontally, as in making a thrust, and so piercing the artery on the same horizontal plane as that on which the cicatrix is placed; or whether the weapon had been held as a knife or dagger usually is held in the act of stabbing, and its point directed downwards. In the latter case, the artery would be pierced considerably below the level of the cicatrix. The tumour pulsated strongly. To the touch, it gave a distinct vibratory sensation or thrill, and to the ear a loud *bruit de soufflet*. By compression, the sac could be emptied; and by firm pressure on the carotid distal of the tumour, the sac became much more tense and resisting to the touch, and, I believe, somewhat larger, which latter circumstances I consider the best evidence of the tumour being aneurismal, and of the aneurism being carotid. His pulse was 84, and moderate as to force and fullness; his appetite good. I ordered ten minims of tincture of digitalis three times a day, spoon diet, and perfect quietude.

On the 9th of January, a week after admission, the tumour and his pulse remained the same. He was now bled to ten ounces, (the blood containing three ounces and a half of serum, and six ounces and a half of coagulum.) His diet was restricted to a pound of bread and a pint of milk per diem, and the digitalis was continued as before. On this day, I made a cast of the tumour, in order to ascertain with accuracy any increase or diminution in its size.

On January the 15th, thirteen days after admission, and six after bleeding, the tumour appeared smaller, pulsated less strongly, and its vibratory feel was less marked. Pulsation had occasionally been observed in the external jugular vein, which I conceive may have been caused either by a communi-

cation between the currents of blood in the common carotid and in the internal jugular, or by the aneurismal tumour striking at each pulsation the external jugular, with which vein the tumour was nearly in contact. The pulse had been 72 for the last three or four days, and the patient felt rather weaker than on admission.

So far, gentlemen, the progress of the case has been favourable, and I think we may reasonably expect that its conclusion will be satisfactory. If, however, the tumour should increase and its walls threaten to give way, we may be forced to an operation as the only chance of saving the patient's life. I have recently made a dissection of the parts concerned, without in the least disturbing them from their natural relations, and, I believe, that deligation of the artery on the cardiac side of the wound would be an operation both most difficult and dangerous to accomplish. Of some of these difficulties and dangers I will speak. The carotid in this case must have been wounded very low down, and it may have been wounded just above the part where it is crossed by the left brachiocephalic vein, a wound of which vein might necessitate the performance of an operation, and would, in all probability, be fatal. A small wound in this vein, or in the lower part of the internal jugular, it is true, might by possibility be treated as Guthrie has done in the latter vein, (but high up in the neck,) i. e., by taking up with a tenaculum the margins of the opening, and then placing a fine ligature around the opening, only in such a manner as to interfere but little with the current of blood through the vein. I believe, however, that this procedure would be impracticable. On a vein lying at the bottom of a deep hollow, filling at every moment with blood flowing from the wounded vein itself. The left common carotid on the level of the sterno-clavicular articulation, you know, lies at a great depth from the surface, and is moreover in rather close contiguity with the two large veins I have mentioned, and also with the left subclavian artery, and with the nervus vagus. At the bottom of a deep wound filled with blood, it would be difficult to isolate and carry a ligature around the carotid with the certainty of not injuring any of these important parts. Some smaller veins, such as the anterior jugular, or inferior thyroid, might, if wounded, embarrass the operation by their bleeding. Any such veins might be tied in two places, and cut between the ligatures, if they could not conveniently be drawn aside. If eventually, in this case, the aneurismal sac should seem about to burst, I should endeavour to place a ligature around the artery on the distal, (though this might not be necessary,) as well as on the proximal side of the wound, on account of the large retrograde current of blood which would take place into the aneurismal sac if a ligature were placed only on its proximal side. Mr. Guthrie has recorded, in his work on "Wounds of Arteries," a case in which, after he had tied the common carotid on the cardiac side of a wound in this vessel, the hæmorrhage from the retrograde current of blood alone was nearly as great as that before the application of the ligature, and was only arrested by deligation of the artery on the distal side of the wound also. Supposing, however, that in S—'s case the operation were accomplished without any mishap, there would still be the danger of a fatal hæmorrhage, when the vessel should be divided by ulceration at the place of deligation, though this is less likely to occur than in a case of spontaneous aneurism, because, in the former case, the artery may be presumed to be healthy. Besides the danger from hæmorrhage, a fatal result may follow from other causes. Experience has shown, that stopping the current of blood through one common carotid may induce fatal disease of the brain, of which Mr. Guthrie cites some cases. Paralysis of the opposite side of the body has been an almost immediate result, attended with twitchings or convulsions of the same side on which the carotid had been tied. Softening and abscess of the brain have also occurred as more remote effects. In *THE LANCET*, of December 17th, 1853, Mr. Solly, in a lecture on Carotid Aneurism, quotes the following passage from a paper by Dr. Norman Chevers, published in the thirty-sixth volume of the late *Medical Gazette*. Dr. Chevers says, "I find fourteen cases in which obliteration of one of the carotid arteries was distinctly followed by great interference with the circulation through the brain, which in eleven cases produced fatal results." Great congestion, or inflammation of the lungs, has also been found to result from deligation of one common carotid.

With all these possible dangers attendant on an operation for the cure of the aneurism under consideration, I preferred adopting the course advised by Mr. Guthrie in analogous cases, i. e., in the wounds of arteries, for he has probably also given more profound thought to the subject than any other surgeon

of the day, and therefore may very justly be looked up to as the highest authority we have. Mr. Guthrie gives the following cases, which I take as precedents for the treatment I have adopted:—Colonel F— was wounded by an arrow, opposite the bifurcation of the right common carotid, which caused a considerable loss of blood at the moment. The wound healed, and some time afterwards a small pulsating swelling—an aneurism—was observed at the part. Sir Astley Cooper advised that, as it did not increase, nothing should be done. Mr. Guthrie was afterwards consulted by the patient at Badajos, after the siege of that place, at which time the aneurism had not increased, nor did it up to the time of the patient's death, which occurred in action the year afterwards, the tumour not having been interfered with by any operation.

Pierre Cadrieux, aged thirty-two, received, in Nov. 1811, a wound from the point of a sword, which, entering above the clavicle, wounded the subclavian artery and vein, as was presumed, where they pass over the first rib. The bleeding was terrific, and the man fainted, remaining as if dead. He was placed under the care of Baron Larrey in the hospital in Gros Caillon. The next morning the wound did not bleed, but a pulsating swelling had formed above and below the clavicle, and a peculiar thrilling sound could be felt and heard deeply in the direction of the axillary vein. The wound healed on the eighth day, and on the twentieth the aneurismal swelling had disappeared, but the thrill remained with the pulsations of the veins of the neck. In 1815, about four years afterwards, the Baron again saw the patient, who had no pulsation in the axillary, radial, or ulnar arteries, but the limb retained its warmth and sensibility. Nothing is said of the subclavian vessels, which we may therefore suppose were free from aneurismal swelling.

Delpach, in a nearly similar case of wound, in which he believed the common carotid was wounded near its origin, and which was followed by a terrific hæmorrhage, which almost destroyed the patient, acted in a similar manner, and with the same successful result.

Mr. Guthrie says, "These cases show the propriety of that rule I have endeavoured to establish, of letting large arteries alone until they bleed and demand attention. There can be little doubt that if Larrey and Delpach had tried to perform operations on these arteries they would have lost their patients. It is time enough to put men's lives in jeopardy when the necessity for doing something is manifest."

It is this advice of so eminent a surgeon as Mr. Guthrie,— advice founded on the results of these and other analogous cases,—which induces me to abstain from any operative procedure until such shall seem the only chance of saving my patient's life. The treatment I have adopted is usually termed *Val-salva's*. It consists in means tending to diminish the impulse of the blood against the aneurismal sac,—viz., venesection, occasionally, the blood being abstracted in quantities which the patient can bear, and without lessening too much the proportion of fibrin to the watery part of the blood; secondly, in spare and unstimulating diet; thirdly, in perfect quiet both of mind and body; and, fourthly, in the administering of medicines capable of lowering the force and frequency of the contractions of the heart. These means tend to favour the spontaneous cure of aneurism, which may be accomplished partly by the slow contraction of the sac, when it ceases to be distended by a superior force, and partly by the deposit of fibrin in layers on the interior of the sac, layer after layer at last rendering the contents of the sac solid, the fibrin becoming eventually partly absorbed and partly organized. The case, I told you, was of exceedingly rare occurrence, for even Mr. Guthrie seems only to have witnessed one case of traumatic aneurism of the common carotid, and has alluded only to another, the case treated by Delpach. The extreme rarity of such cases is to be accounted for by the fact that wounds of the common carotid are almost always fatal from the immediate loss of blood. This lecture, gentlemen, I will conclude when time shall have shown us the conclusion of the case.

#### [CONTINUATION OF LECTURE, MARCH 27TH, 1854.]

It is now, gentlemen, ten weeks since I had the pleasure of meeting you in order to call your attention to a case of traumatic carotid aneurism. Since that period the case has proceeded, as you already know, most favourably, and I have little else to do than communicate to you a continuation of its history. In my last lecture I read to you my notes as far as the sixth day after the first venesection, at which time I thought there was a slight diminution in the size of the aneurismal tumour. Two days after this, on the 17th of Jan., there was a very marked prolongation of the tumour upwards,

—i. e., in the direction of the blood's current, the pressure of which was probably greatest against the upper part of the sac, and, if so, from this cause its dimensions were increased in this direction. It is true that the upper part of the sac might have been the least resisting, and therefore the first to yield, even though the impulse of the blood against it should not have been greater than against the rest of the sac. This protrusion of the aneurismal sac felt like a small nodule engrafted, as it were, on the general swelling. The pulse was at this time 66, and small, and the patient did not therefore for the present appear capable of bearing a further loss of blood.

On Jan. 22nd, thirteen days after the bleeding, the tumour was decidedly smaller, and the pulsation, which had been occasionally seen in the external jugular, had ceased for some days past.

On Feb. 2nd, twenty-four days after the first bleeding, the tumour was still on the decrease, and he was bled again to twelve ounces, which he bore well.

On Feb. 6th, four weeks after the first bleeding, the tumour was reduced to half its former size, the diminution being very great after the last bleeding. It had been gradually and very perceptibly diminishing during the last fortnight. It felt quite solid and much harder, but the bruit remained as loud, or nearly so. There had not been observed any pulsation in the external jugular during the last two or three weeks, but a distinct vibratory feel or purring had throughout been perceptible over and along the course of the internal jugular, from the cicatrix to a point as high as the angle of the jaw, or very nearly as far. His health and strength had not been impaired by the treatment, which had been steadily pursued from the first.

On Feb. 22nd, six weeks and two days after the first bleeding, and fifteen weeks after the receipt of the wound, the tumour was scarcely perceptible; and as his strength had not in the least suffered, he was again (the third time) bled to ten ounces; and it is worth bearing in mind that the blood preserved its former proportion of fibrin—viz., six ounces and a half of coagulum, to three ounces of serum.

Eight weeks after the first bleeding, the tumour was still, though scarcely, visible, and it felt beneath the skin like a hard and slightly enlarged lymphatic gland. During the whole of this time, he had taken three times a day fifteen or twenty minims of the tincture of digitalis, and the same diet had been strictly adhered to. He was now allowed to sit up for the first time.

Nine weeks after the first bleeding, and eighteen after the receipt of the wound, the aneurismal tumour was no longer visible, but could still be felt beneath the skin. The bruit was perhaps as loud as ever, continuous, sounding like the roar of the sea, but increased at each pulsation; the vibratory feel was also the same.

On March 20th, ten weeks after making the first cast of the neck, I made a second, of which the right and left sides presented no difference, except that on the left there was a raised and puckered cicatrix. The same bruit still was heard as loud, and the same vibratory feel was still as distinct over the course of the internal jugular, all of which phenomena remain the same up to this day, the end of the eleventh week after the first bleeding; but no vestige of the tumour can be felt beneath the skin. For the last week, he has been allowed a small mutton chop daily, in addition to the pound of bread and pint of milk. His health is good, and he feels much stronger than he did a week ago. The persistence of the loud, continuous bruit, and of the vibratory feel perceived over the course of the internal jugular, can, I conceive, only be accounted for by the supposition of a communication between the currents of blood in this vessel and in the common carotid, both of which may have been penetrated by the wound.

P.S.—If a communication between the common carotid and internal jugular exists—and I do not see how it can be otherwise, for both the bruit and the thrill can be perceived nearly as high up as the angle of the jaw, and the thrill is not felt by placing the finger on the carotid—then this case is one of, perhaps, unprecedented occurrence, for in it we find both a traumatic carotid aneurism, and also this abnormal communication between the artery and vein. Firm pressure on the common carotid near its bifurcation causes a total cessation of the thrill, and diminishes greatly the loudness of the bruit. *A priori*, I should have expected a contrary effect. The tumour could not have been an aneurismal varix, a mere venous dilatation caused by the impulse of arterial blood, for such could hardly have occurred as a subcutaneous tumour in a vein so deeply placed, and so covered by muscles; and,

moreover, its contents would not have become solid before disappearing, nor is it likely that it would have disappeared at all.

It will be interesting hereafter to learn if violent muscular exertion can cause the upward current of blood from the carotid so to impede the downward current in the internal jugular as to give rise to any cerebral disturbance such as congestion might induce.

A cast of the patient's neck, made when the tumour was at its largest, and another made ten weeks afterwards, when the tumour had entirely disappeared, I hope very shortly to be able to send to the museum of the Royal College of Surgeons of England.

## CLINICAL AND CRITICAL CONTRIBUTIONS TO OBSTETRIC SCIENCE AND PRACTICE.

By ROBERT BARNES, M.D. Lond.,

MEMBER OF THE ROYAL COLLEGE OF PHYSICIANS, PHYSICIAN-ACCOUNTEUR TO THE WESTERN GENERAL DISPENSARY, PHYSICIAN TO THE METROPOLITAN FREE HOSPITAL, LECTURER ON MIDWIFERY, ETC.

(Continued from p. 669, vol. I. 1864.)

### II.—ON VASCULAR POLYPI.

The tumours which take their rise from the bloodvessels running under the mucous membrane are the true "*vascular polypi*," a term which has not unfrequently been erroneously applied to the fibro-cellular polypus. The vascular polypus is a form of teleangiectasis consisting in a dilatation or aneurismal growth of the vessels, resembling *navas* or *hemorrhoids*. This form of polypus is rare. Examples have, however, been recorded.

### III.—ON POLYPI SPRINGING FROM THE MUCOUS MEMBRANE.

The tumours which arise from the mucous membrane are of two kinds.

A. The *fibro-cellular polypus*, sometimes called the "*gelatinous*," the "*mucus*" or the "*vesicular*" polypus. These polypi most commonly spring from the cavity of the cervical canal; they are but rarely found in the cavity of the uterus; and perhaps this may be accounted for by the scarcity of cellular tissue in the constitution of the mucous membrane in this latter situation. The microscopical characters of these polypi assimilate to those of the fibro-cellular sub-mucous tissue. Mr. Paget has accurately described them as presenting "delicate fibro-cellular tissue, in fine, undulating, and interlacing bundles of filaments. In the interstitial liquid, or half-liquid substance, nucleated cells appear imbedded in a clear or dimly-granular substance; and these cells may be spherical, or elongated, or stellate, imitating all the forms of such as occur in the natural embryonic, fibro-cellular tissue; or the mass may be more completely formed of fibro-cellular tissue, in which, on adding acetic acid, abundant nuclei appear. In general, the firmer the polypus is, the more perfect, as well as the more abundant, is the fibro-cellular tissue." To this it may be added, that these polypi are covered by mucous membrane, containing blood-vessels in greater or less abundance. The size of these polypi varies greatly. They seldom, however, attain the magnitude sometimes exhibited by the muscular polypi. The polypus I removed from the first patient answered exactly to this description.

B. The *follicular-epithelial polypus*. I propose to give this name to the tumour which has sometimes been less accurately called the "*Nabothian*" or the "*glandular*" polypus. This form is thus described by Dr. Lee:—

"A fourth variety of tumour of the uterus, to which the term polypus has been applied, is produced by a morbid enlargement of the glands or ovule Nabothi. One of these bodies is sometimes converted into a cyst as large as a walnut, or even a hen's egg, and hangs by a slender pedicle from the cervix or lips of the os uteri. It is smooth and vascular, and contains, in some instances, a curdly matter, or yellow-coloured, viscid fluid. .... Though unacquainted with the nature of the glandular tumour of the os uteri, Herbiniaux has given a description of the appearance it most frequently presents: 'There is another species of polypus,' he observes, 'extremely soft, of which M. Levret has not made mention: it is a little excrescence, of the same form as the preceding, but which is always very small; it arises from a segment of the orifice of the uterus, and either remains within the orifice or hangs a few lines out of it.' Often it is not larger than a pea, sometimes it is the size of a finger, but its stem is usually very large, considering the small size of the tumour."

The microscopic examination of the tumour removed from the second patient demonstrates very clearly the true nature of the "glandular" polypus. The polypus referred to was of the size of a large filbert; the surface very vascular. On cutting through it, a central cavity was exposed, large enough to hold a large pea; from this there flowed a quantity of pus-like fluid. The substance of the tumour was formed of a fibrous basis, containing numerous large mucus follicles, penetrating throughout, and lined with cylinder-epithelium. The openings of the follicles on the outer surface of the tumour were distinctly traced. The constitution of the tumour will account for its consistence; it cut like butter. It also explains the facility with which the ligature severed the tumour from the os uteri.

I think it will be apparent, from this description, that it is not strictly correct to call these tumours "glandular" or "Nabothian." They contain all the elements of a villus, and the present example seems to verify a conjecture of Dr. Hassall's, quoted by Dr. Tyler Smith,\* "that the solid polypi found attached to the cervix take their rise in enlarged villi of the cervix uteri." I conceive that their growth may be accounted for in the following manner: one or more follicles in this situation become obstructed; the accumulation of secretion behind the obstruction causes the enlargement and protrusion of the follicles; an entire portion of the villus is thus carried out or projected beyond the surface, and, continuing to grow, assumes a polypoid form. I imagine that the pus-like fluid contained in the cavity of the polypus was not pus, but the result of the secretion of the follicles contained in the tumour, which opened into the cavity.

It may be observed that Dr. Lee does not advert to the minute structure of the tumours he describes.

Other forms of tumour, projecting more or less distinctly into the cavity of the uterus or cervix, occasionally appear, but they are comparatively rare, and seldom assume the polypoid form.

The foregoing history of the different forms of uterine polypi seems clearly to establish the general law, that these growths are not new formations—heterologous structures—but abnormal developments of the normal constituent tissues of the uterus.

#### ON THE DIAGNOSIS, ESPECIALLY THE EARLY DETECTION OF POLYPUS.

In the remarks I have to offer relating to the diagnosis of polypus, I shall pass over altogether the consideration of the means of distinguishing polypi which have cleared the os uteri from other abnormal conditions. At this stage of growth, the recognition of the true nature of the tumour is seldom attended with any practical difficulty. But the case is far different when the tumour still lies concealed in the cavity of the uterus or of the cervix. It is quite certain that a polypus of inconsiderable size, retained in the womb, and giving no physical sign of its presence, may yet be the cause of the most dangerous, and even fatal, flooding. The indication to remove a polypus, however small, although situated in the cavity of the uterus or of the cervix, if it be the occasion of exhausting hæmorrhages, is as manifest as that for the removal of the largest polypus lying forth in the vagina. The detection and treatment of polypi which have not emerged from the uterus, is a subject that has as yet attracted far too little attention from the profession. With the exception of the masterly and practical essay of Professor Simpson,† I am not acquainted with any successful attempt to grapple with the difficulties of the subject.

The means of determining whether a polypus exist in the uterus may be divided into two classes:—

- I. The general symptoms.
- II. Physical exploration.

1. The general symptoms, although seldom, perhaps in no case, so characteristic as to justify an absolute conclusion, positive or negative, are yet deserving of the most careful analysis. The symptoms considered by Dr. Simpson are hæmorrhage, either in the form of flooding, irregular and occasional discharges of blood, or of hæmorrhagic menstruation; in leucorrhœa, mucus, purulent, or serous; in increased size of the cervix or body of the uterus; in symptoms of irritation of the bladder and rectum.

It must be obvious that these symptoms possess in themselves no special or pathognomic value. They may all be present in connexion with simple hypertrophy of the uterus, and more frequently with tumours of the body of that organ not of a polypoid form. The womb may be increased in size from hypertrophy, or a tumour in its walls, or from pregnancy, and its increased bulk from either of these causes will be as likely to produce irritation of the bladder and rectum as

increased bulk from any other cause. I may, however, observe, that when the uterus is enlarged by the development of a body in its cavity, we may expect, it to be more evenly rounded in shape.

Hæmorrhage and leucorrhœa do not necessarily indicate any local disease at all, but they undoubtedly point to the necessity of instituting a careful examination with a view to discover the cause upon which they depend. The leucorrhœa attendant upon polypus not unfrequently possesses one quality which may have a diagnostic value. Blood may coagulate in the form of rings round the pedicle of the polypus, and then putrefy; the discharge thence acquires an offensive character, which may lead to the suspicion of malignant disease. On pursuing the diagnosis, the existence of malignant disease may be negatived, and then the probability that a polypus is present will acquire greater strength. Hæmorrhage is not even a constant accompaniment of polypus. Dr. Montgomery, Dr. Simpson, and Dr. Looock, all relate cases of polypi, some of large size, in which no hæmorrhage was observed. But although, as a general expression, hæmorrhage cannot be regarded as a diagnostic symptom of polypus, there is, I think, a mode of examining the subject which may give something of certainty and precision to this symptom. I have, in relation to this inquiry, analyzed the histories of 600 cases of disease, more or less connected with uterine derangement, which have come under my observation at the Western General Dispensary.

#### Probable Causes of Hæmorrhage in 600 Cases of Disease more or less connected with Uterine Derangement.

Inflammation, ulceration, and hypertrophy of os and cervix uteri	12
Inflammation and ulceration of os and cervix uteri	32
Inflammation of os and cervix	16
Hypertrophy of cervix	16
Total disease of os and cervix uteri	— 76
Enlargement of uterus	8
Tumours of uterus	14
Procidencia uteri	2
Total disease of uterus	— 24
Scirrhus of cervix or body of uterus	10
Polypus	8
Abortion	14
Pregnancy	6
Ovarian irritation	2
Over-suckling	18
At critical period	10
Other constitutional derangements	10
Sea-voyage	2
Emotion	6
Not ascertained	4— 90
Total cases of hæmorrhage	190

It thus appears that, out of 600 cases of disease, more or less connected with uterine derangement, nearly one-third were marked by an excessive loss of blood, either in the form of hæmorrhagic menstruation or of simple flooding.

By means of a careful analysis of the symptoms, or by vaginal examination, the hæmorrhage could be referred to an intelligible cause in 186 cases.

In analyzing these cases of hæmorrhage with the view of determining how far hæmorrhage is an indication of the presence of polypus in the womb, we must, in the first place, exclude all those cases in which the hæmorrhage was clearly connected with organic disease, with pregnancy, with abortion, mental emotion, and constitutional derangement. We shall thus eliminate 160 cases, leaving eight cases in which polypus was detected, and twenty-two cases in which tumours in the body of the womb or simple enlargement were found. I desire to arrest attention upon these twenty-two cases, because I believe it to be not improbable that in some of them the cause of the enlargement observed in the uterus might have been due to a polypus concealed in the cavity, and that in some of the instances in which tumours were discovered in the walls of the uterus there might have been also muscular tumours projecting inwards in the form of polypi. It is not improbable that a more minute exploration, facilitated by dilatation of the uterine neck, the cautious employment of the uterine sound, and other means, might have discovered a polypus at the beginning of the treatment or at a later period.

Possibly, also, fibro-cellular polypi might have been discovered in some of the cases where the hæmorrhage appeared to depend upon inflammatory and hypertrophied conditions of

\* Medico-Chirurgical Transactions, vol. xxxv.

† Monthly Journal of Medical Science, January, 1860.

the cervix, had a more minute exploration been extended into the cavity of the cervix. It might have been ascertained that the polypus was the original disease, and the inflammation or hypertrophy the secondary result. I state this, because I do not feel justified in affirming absolutely that, in none of the cases described as cases of inflammation, ulceration, or hypertrophy, did a polypus exist, and because it is known that they may exist together. In the great majority of instances, however, I had the opportunity of continuing the treatment until the local disease was subdued, and of witnessing the concurrent cessation of the hæmorrhage.

I submit that it is a point worthy of the most earnest consideration, whether in most, if not in all, cases of profuse uterine hæmorrhage, not obviously dependent upon constitutional causes, or not clearly connected with some ascertained local disease, it be not an indication in practice to explore carefully the cavity of the womb.

The analysis I have submitted appears to me to lead to the legitimate conclusion that, in a given case of persistent or often-recurring uterine hæmorrhage, where no adequate constitutional cause is observed, where no sufficient organic disease of the os and cervix uteri can be detected, in the absence of pregnancy, some local cause exists higher up in the cervix or in the body of the uterus. Having arrived at this conclusion, it is an obvious indication to pursue our investigation, and to endeavour to determine exactly in what that cause consists. Excluding all other causes, we find a residue of thirty cases of uterine hæmorrhage connected with the three following conditions: eight cases of detected polypus, eight cases of enlargement of the womb, and fourteen cases of tumours of that organ. The cause of the hæmorrhage, then, in all these cases lies above or beyond that part of the organ which is more immediately subject to ordinary tactile and visual examination. Is not the indication clear to pursue the search into that region which has alone remained unexplored?

Before considering the physical means of following up this search, I wish to point out one symptom which may furnish a useful indication. When the uterus contains a foreign body, even of small size, it rarely happens that contractions are not excited—that efforts are not made to expel it.

The occurrence, then, of spasmodic intermitting pains, resembling those attendant upon abortion or labour, together with globular enlargement of the womb and hæmorrhage, point, under the exclusive conditions premised, with a high degree of probability, to the presence of a polypus.

It must, however, be admitted, that the general symptoms can furnish at best but presumptive evidence. In the case of pregnancy, which is attended by general signs of a marked character, no practitioner of experience undertakes to base an absolute opinion upon the general signs alone. He looks for the direct physical evidence afforded by *ballotement*, the placental rush, or the sound of the fetal heart. In the case of polypus, the general symptoms can never rise to that point of distinctness which is usual in pregnancy; the necessity, therefore, of seeking for direct physical evidence is still more imperative.

*The Physical Means of detecting Polypi.*—It may be that the polypus has descended so low down as to be on the point of escaping through the os uteri. In this case it may, under favourable circumstances—that is, during the relaxation and forcing down attendant upon an attack of flooding—be perceived by the finger. Its detection is even more probable by the use of the bivalved speculum, which, by expanding, opens the os, and permits an inspection of a certain portion of the cervical canal. The uterine sound is also available in further opening the os. An observation of Dr. Looock's clearly expresses the importance of making the examination during the existence of the hæmorrhage. He says—"I never discovered the polypus in these cases when I examined the uterus in the intervals between the attacks of hæmorrhage, either by the finger or speculum. The os uteri closes in the intervals of the attacks. The tumour comes down during hæmorrhage." It has occurred to me in several instances to have observed a polypus at one examination, which could not be detected on a subsequent occasion.

Another cause that may help to conceal a polypus in the cervix, is the congestion and swelling of the os, induced by the irritation caused by the polypus, or arising from independent circumstances. This condition may be removed by appropriate treatment, and when the os has been restored to its natural state, the polypus may be brought into view.

*The Uterine Sound.*—As a means of extending tactile perception beyond the point which it is possible to reach by the finger, the uterine sound is in some cases a most valuable instrument. By its mean will generally be possible, in cases

where the os and cervix are sufficiently open, to determine whether or not a movable body be present in the uterus.

Should our conviction or our presumption, derived from the evidence of the uterine sound or from other sources, be so strong, that a polypus is present in the cavity of the womb, we possess means of bringing it into view. By causing contractions of the womb the contained body may be expelled. The ergot of rye has been used for this purpose, and no doubt sometimes with success; but I greatly prefer the agency of *galvanism*, as being both more safe and more efficacious. Dr. Tyler Smith has already applied galvanism in one instance for this purpose, with complete success.

Dupuytren recommended the practice of opening the cervix in these cases by *incisions*. Although I can conceive a case in which this operation may be justifiable, I believe that the necessity for resorting to it must very rarely occur, since we possess another means of effecting the object in view, with as much certainty and with less danger.

The plan of *dilating the os and cervix uteri* by means of sponge-tents, proposed by Professor Simpson, finds, in cases of this description, its most valuable application. The use of two or three graduated sponge-tents in succession will mostly succeed in opening up the canal of the cervix to an extent sufficient to admit of a perfect exploration by the eye and the uterine sound of the cavity of the uterus.

I am aware that the proposal to use sponge-tents, for the purpose of dilating the os uteri, has met with considerable objection. It has been urged that such a procedure may cause inflammation and other serious consequences. It does not appear to me that these objections are substantiated by experience, or by sufficient reason. Sponge-tents have been long employed for the purpose of inducing premature labour. Dr. Lee has sanctioned by his example their use for this purpose. The state of the cervix during early pregnancy does not differ widely from that of the cervix when an intra-uterine polypus exists. When a polypus is present, under the influence of the attendant hæmorrhage, leucorrhœa, growth of the tumour, and action of the uterus, the cervix is already disposed to relax and to expand; and it does not seem reasonable to apprehend that the presence of a soft piece of sponge in the os uteri should be more hurtful or dangerous than the oftentimes far greater pressure exerted upon the cervix by a polypus. Under many circumstances, of not greater urgency, that occur in obstetric practice, those physicians who express so much dread of the possible effects of the sponge-tent, do not hesitate to enjoin the violent expansion of the uterine neck by the hand.

To exclude this application of an agent which experience has proved to be both safe and effectual, is, in effect, to pronounce—in the case of an obscure disease, situated higher up than the os uteri, however threatening to life—that the resources of medicine are exhausted, and that the patient must be abandoned. To urge, as it has been urged, that if you wait long enough, the polypus, if present, will not fail to make its way into the vagina, is to advocate a delay that may be fatal. The treatment, by expectancy, is surely inappropriate when an uncontrollable flooding is fast destroying the patient.

M. Jobert de Lamballe has recently contrived an *intra-uterine speculum*, which may possibly be of service in assisting the visual examination of the uterine cavity and the cavity of the cervical canal. This instrument consists in a hollow cylinder, and a long stem to fit; the circumference is so small, that it can be passed into the uterine neck, the os uteri being previously brought into view by the ordinary speculum. By the withdrawal of a slide attached to the stem, the cylinder may be converted into a groove, so as to permit of an inspection of any part of the canal.

I cannot speak of this instrument from experience. Possibly its utility may fall short of the expectations of the inventor. Its employment would be facilitated by the previous expansion of the uterine neck by means of the sponge-tent.

(To be concluded.)

## LEAD CISTERNS AND PIPES IN A SANITARY POINT OF VIEW.

By ROBERT DUNDAS THOMSON, M.D., F.R.S.L. &  
PROFESSOR OF CHEMISTRY IN ST. THOMAS'S HOSPITAL COLLEGE, LONDON.

[THE following are notes of evidence, in the case of the Loch Kérine Water Bill, before a recent committee of the House of Commons. The corporation of Glasgow are desirous of obtaining the pure water of that romantic lake for the supply of the in-

habitants; but the plan was opposed, on the plea of its great purity, and consequent rapid action on lead. This objection has been shown, by the present and other evidence, to be visionary.]

Having been consulted on the subject of the supply of water to Glasgow, Gorbals, Dumfries, Kilmarnock, Stirling, London, Newcastle, Swindon, Liverpool, &c. &c., and very extensively on the sanitary condition of waters, the subject of the action of water on lead has for many years been familiar to me, and I have had considerable opportunities of meeting with cases where paralysis had been produced by the action of lead on the human system. As far as I can ascertain from the experience of hospitals, the occurrence of disease from the corrosion of lead pipes is an exceptional circumstance, if it has ever occurred in these institutions, the general cause of affections from lead being occupation in white lead manufactories.

Waters, from whatever source, appear to act on a freshly-polished surface of lead. Thus, I have found the water taken from the Thames, Clyde, Gorbals water-works, Kypess river, Paisley water-works, Giviel river, sources in the neighbourhood of Glasgow, to act on lead; the greatest amount of saline matter in these specimens being in that of the Thames, which contains about twenty-two grains of solid residue in the imperial gallon, while the Giviel contains only about seven grains. Again, I find the water from a well at St. Thomas's Hospital, London, to act very sensibly on a fresh surface of lead, although the solid constituents in the gallon amount to about one hundred grains. This experiment is further corroborated by a circumstance in reference to a well, respecting which I was consulted several years ago in Glasgow. The wells of Glasgow, like all those of large cities, are known to be impure. They contain from fifteen to one hundred grains of salts in the imperial gallon, and yet, on one occasion, water was brought to me which had been pumped through a new lead pipe from a well in a garden, which contained a considerable quantity of oxide of lead diffused through it. I inferred that the oxide of lead was principally in suspension, from the fact that when the water was filtered through a single paper filter, no lead could be detected in the water when it had passed the paper; and it is a well ascertained fact that water, contaminated with oxide of lead, is entirely freed from it by permeating a filter of sand. All these facts relate to lead possessing a bright surface. For lead, when allowed to remain in these waters for a few days, ceases to suffer appreciable corrosion; or, if the lead be removed from the water, exposed to the air and afterwards immersed, but an insignificant action, if any, can be detected.

Loch Katrine water I examined several years ago, when it was proposed to be introduced for the supply of Glasgow. I considered it then, as I do now, a water admirably adapted for domestic use, and I have not had my opinion in the slightest degree affected by the laboratory experiment exhibited on the committee's table, as I am convinced, from my acquaintance with the subject, that if the Loch Katrine supply had been introduced into Glasgow, nothing would have been heard of its influence on lead. I found it to contain about two grains of solid matter in the gallon, its main constituents being organic matter, common salt, sulphate and carbonate of lime.

When lead, with a clean, bright surface, is introduced into it, the lead is rapidly acted on, and white scales of oxide fall to the bottom of the vessels in which the experiment is made. When such water, with the suspended oxide of lead is passed through a double filter of paper, the oxide is detained on the filter, and little or none seems dissolved in the water which passes through the paper. Hence it would happen, that should any corrosion occur on the first use of new lead cisterns, the insoluble oxide will be deposited at the bottom of the cistern, and will only intermingle, in a trifling degree, with the contents of the cistern; while in old cisterns, or after the new cisterns have become tarnished, no action will occur. But to prevent any corrosion on first using the cisterns or pipes, the plan sometimes adopted at Tunbridge Wells might be had recourse to, of brushing over the fresh surfaces with a coating of lime. No description of water could be purer or better fitted for a beverage, or for culinary purposes, than the water supplied by lead pipes to the Trossach's Hotel, at Loch Katrine, where I lately tasted it when inspecting the experiments made under the charge of the engineer, at the outfall of Loch Katrine.

To set the objections at rest which have been urged against the use of Loch Katrine water, I may detail an experiment on a sufficiently large scale of a parallel nature, which has been in action for forty years. About 1814, a plumber at Tunbridge Wells, introduced, at his own risk, a spring of water, by means of lead pipes and lead cisterns, into the houses of that place. A similar objection was taken to its use, as on the

present occasion. Traces of lead were even detected in some places in that portion of the water in immediate contact with the new lead cisterns, but none in the body of the water, or in the water discharged from the cisterns. Specimens of this water were sent to London in 1816, and tested by Dr. Thomas Thomson, without his being able to detect a trace of lead. I have a letter in the handwriting of the late Dr. Wollaston, dated 27th of December, 1816, in which he states, that he could detect no lead in water sent to London from Tunbridge Wells. Traces were occasionally detected in the new cisterns, and, as I was assured by the late Dr. Thomson, only on the margins in contact with the lead, the largest quantity obtained being one grain in twenty gallons. Yet, from these incidental results, the water supplied to the village was condemned by the opponents of the scheme as *potentius*. But the water still continues in use; the village has increased to a large town of 10,000 inhabitants; it is a popular place of resort for invalids; and after careful inquiry, I have not been able to discover among its residents even a suspicion of its contamination by lead. I examined the company's engineer, who was employed at the original works, and laid down many of the lead pipes and cisterns in his capacity, at that time, of plumber, and persons in the town, residents of about twenty years, who assured me that they had never heard the subject of danger to water from lead pipes mooted.

When bright lead is introduced into this water, it is acted on immediately. It contains between three and four grains of salts to the imperial gallon, and is, upon the whole, one of the purest waters which I have examined in reference to the supply to towns. In examining the reservoir in which the water is retained for the supply of the town, I observed a perforated plate of lead, through which the water passed to the iron conduit pipe, which was covered with a coating of oxide of lead, precisely similar to the coating lining the lead-pipes which I have seen brought from Inverness, a town with whose water supply I am well acquainted. The plate, I was told, had been in this position for six years. The deposit was therefore insoluble, or nearly so, in the water, and acted as a protecting covering against any further action on the lead. Hence it would appear that this water, by its rapidly oxidizing power on lead, furnishes with so much the greater efficiency security against further corrosion. Perhaps no stronger fact could be adduced in proof of the perfect confidence of the inhabitants of Tunbridge Wells in the sanitary quality of the water than that, of which I was assured by the engineer, the company is now paying an annual dividend of ten per cent. The original spring introduced for supplying the village is situated at about the distance of a quarter of a mile to the south, and is emitted from the northern aspect of a declivity. Many years after it was in use, from the increase in the population, the supply was found to be inadequate to the demand, and another spring, about a mile distant in the same direction, but issuing on the southern declivity of the same ridge, was collected in a similar reservoir of brick, and pumped into the village reservoir, to mix with the waters of the first spring, which is conveyed to its destination by gravitation. The second spring I found to be more rapid and more extensive in its action on lead than the water of the first spring, which alone, as far as I could learn, had attracted any attention; and even the circumstances to which I have already referred were quite unknown to any person with whom I came in contact. Still more recently, a third spring, under different management, but of very soft water, and therefore with the corrosive qualities upon lead of the waters affording the previous supply, has been introduced into the town, with the universal approbation of the inhabitants, as far as regards its wholesomeness, purity, and softness.

Irrespective, then, of the probability that the Loch Katrine water will lose much of its corrosive power by its contact with the various strata over which it must pass in the conduit, during its flow to Glasgow, I am of decided opinion that no more permanent danger is to be apprehended, in reference to health, from the transmission of the water through lead pipes, and detention in lead cisterns, than there is in the case of other waters supplied to towns. I may add, however, that I have always recommended the substitution of iron and other materials, as water-pipes, as much as possible, for lead; and, even where lead is employed, that it should be alloyed with tin.

July, 1864.

THE LISTON MONUMENT IN SCOTLAND.—Mr. Alexander Macdonald has forwarded to the Royal Infirmary of Edinburgh a polished granite pillar and pedestal for the marble bust, by Campbell, of the late Mr. Liston, which bust was lately sent from London for erection in the Infirmary.

## OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

*Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.*—MORSEUS. *De Sed. et Caus. Morb.* lib. 14. Procrutium.

### ST. THOMAS'S HOSPITAL.

#### MR. SIMON'S CASE OF VERRUCA OF THE GLANS AND PREPUCE, SECOND CROP; REMOVAL OF A CERTAIN PORTION OF THE GLANS.

THIS case offers a very satisfactory confirmation of the opinion we expressed in reporting the first operation—viz., that verrucae, which are by some surgeons considered as secondary manifestations, are simple unspecific growths, which are very apt to recur on the glans or prepuce, as they are prone to do on any other part of the body, especially the hand.

Mr. Simon had in this case (*THE LANCET*, vol. i, 1854, p. 618) removed a considerable quantity of warts, which had grown so thickly on the glans and prepuce, as completely to change the shape and form of the organ. A very small portion, had, however, been left, and the growth had recurred from the spot which had been spared. In order to prevent this very unpleasant reappearance of the verrucae, Mr. Simon removed, on the 1st of July, the group which had sprung up between the glans and prepuce on the right side, and also a quarter of an inch in depth of the glans itself. It is very likely that this will be found an effectual measure.

On the same day, another patient of Mr. Simon, presenting very instructive symptoms, was brought into the theatre. He is a man, about sixty years of age, whose penis, affected with cancer, was removed about six months before his second admission. The disease had then invaded the organ to such a degree, that amputation was performed close to the pubis, and within the scrotum. Much trouble had ever since been experienced about passing water, and Mr. Simon had recourse to various means to facilitate the function of micturition, but bougies, &c. proved of no avail. A thread was at length passed through the urethra, and allowed to ulcerate through, so that a sufficient aperture might be obtained; but all these measures were ineffectual, and when the patient was placed upon the table, the pubic region presented a rather unusual aspect. The scrotum was puckered up towards the pubis, in which locality, not a vestige of penis was to be seen; and the parts were so much contracted, that no aperture for the discharge of the urine could be discerned. Mr. Simon stated, that the fluid usually escaped through an aperture which would just admit the head of a pin.

Under these circumstances, Mr. Simon thought the wisest plan would be to establish a permanent fistulous opening in the perineum, and allow the patient to micturate through the membranous portion of the urethra; by this operation, the man would be saved the pain and inconvenience he now suffered, and freely void urine by the perineum. When he was under the influence of chloroform, a probe was passed into the pin-hole aperture over the pubis, corresponding with the urethra, but it was found so difficult to get the instrument into the urethra, that Mr. Simon thought it prudent to postpone the operation for a few days. We shall follow this case with much interest, and beg, in the meantime, to refer to one of a somewhat analogous nature, lately operated upon at another hospital.

### ST. BARTHOLOMEW'S HOSPITAL.

#### CANCER OF THE PENIS; AMPUTATION; MODE OF KEEPING THE URETHRA PATULOUS.

(Under the care of Mr. PAGET.)

In this case the patient, a man about forty years of age, and with whom phimosis had been congenital, had suffered from cancer of the penis for the last three years, the organ being involved close to the pubis. When seven years old he received a blow on the prepuce, which violence was followed by a certain thickening of the part. Three years before admission the patient had retention of urine,

when the prepuce was slit up by a surgeon; the wound thus made never healed, and upon it the cancerous ulceration, which led to the destruction of the organ, took its rise.

Mr. Paget removed the penis in the usual manner, at a short distance from the symphysis, and, after the requisite number of arteries had been tied, he incised the scrotum upwards and downwards for about an inch and a half. A thread was then passed through one side of the membrane forming the new meatus, and also through the margin of the scrotum just corresponding; the same was done on the opposite side, and, when the knots were tied, the mouth of the urethra was rendered large and gaping by its lateral connexions with the scrotum. In this manner no catheter was needed, and the results may be expected to be very satisfactory.

Mr. M'Whinnie, present at this operation, mentioned that he had succeeded in preventing the contraction and narrowing of the new meatus, after amputation of the penis, by following Dupuytren's practice. It is well known that the latter surgeon was in the habit of amputating the organ in a slanting direction, from above downwards and forwards, so as to make the spongy portion of the organ somewhat longer than the cavernous part. He thus obtained at the extremity of the urethra a kind of spout, which greatly facilitated the escape of the urine. There can be no doubt that, in whatever way the operation is performed, the most effectual mode of insuring a permanently patulous meatus, is to allow the wound to heal over a catheter left in the bladder. When the instrument causes a great deal of irritation, and cannot be borne, it would be a simple thing to fix an india-rubber or silver plug in the urethral aperture, which plug might be retained in situ as long as necessary by an elastic band running round the perineum.

#### UNUNITED FRACTURE OF THE FEMUR; DIEFFENBACH'S PEGS; AMPUTATION FOURTEEN WEEKS AFTER THE USE OF THE PEGs; SECOND REPORT.

(Under the care of Mr. STANLEY.)

AMONGST the cases of interest which have for some time been under treatment at this hospital, there is one to which we would for a moment allude. Our readers probably remember that Mr. Stanley had a little while ago under his care a case of ununited fracture of the femur, in which he used pegs, according to Dieffenbach's method, in order to excite the necessary action in the extremities of the fragments. The operation was described in a former "Mirror," (*THE LANCET*, vol. i, 1854, p. 360,) and we now add a brief account of the results.

In the first account of this case, we closed our report with these words: "The two principal features which have marked the course of this case are, a slight attack of erysipelas, and sudden hemorrhage; but it may be hoped that these untoward events will not interfere with the success of the operation." Our expectations have not been realized, and in spite of the best efforts on the part of the surgeon, sloughing, abundant suppuration, and occasional hemorrhage, reduced the patient to so alarming a state of debility, that amputation had to be performed on the 24th of June, about fourteen weeks after the introduction of the pegs. The wire which Mr. Stanley had used, in order to render the approximation of the fragments more certain, had been removed some weeks after the operation, as it was found to create much irritation. The amputation of the thigh had to be performed very high up, and the flaps were made by oval incisions, both anteriorly and posteriorly, the greatest precautions being taken to prevent the loss of much blood. The patient is now, a month after the removal of the limb, in a fair way of recovery, the stump being almost cicatrized; but his case required very careful management, as he had several attacks of hemorrhage, which, in his weak state, created some apprehension.

It may easily be imagined that some curiosity was felt respecting the state in which were the fragments which had resisted the treatment mentioned above. When the part had been carefully dissected, and the fragments came into view, they were found riding, tapering, and rounded at their extremities; here and there bony processes had sprung up, giving to the bones an irregular, nodulated appearance; but no signs of an attempt at union could be distinguished. Two of the pegs were now taken out, and they were noticed to have been reduced from one inch and a half to barely half an inch, being, in fact, much eaten away.

It has for a moment been supposed by a few observers that this diminution of size in the pegs was due to a kind of absorption, the animal and inorganic matter of the ivory being taken up into the patient's system; but such a supposition can hardly be entertained, and it appears simpler to look at the shortening of the pegs as a mere result of crumbling down of their

substance, after being softened by the moisture and the high temperature of the part into which they were implanted.

Before leaving this hospital we shall just mention, that in Lazarus' ward there is a nurse upon whom the 'Taliacottian operation' was performed by Mr. Vincent, thirty years ago. It is not often that cases of this kind can be followed through such a long series of years, and we felt much interested at perceiving the firmness and tolerably regular shape which the autoplasmic nose had retained. The scar on the forehead is hardly perceptible, and such a case is well calculated to induce operators to resort to the rhinoplastic operation, when they meet with a suitable opportunity.

### Medical Societies.

#### ROYAL MEDICAL & CHIRURGICAL SOCIETY.

TUESDAY, JUNE 27TH, 1854.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

#### ON GOUT AND RHEUMATISM: THE DIFFERENTIAL DIAGNOSIS AND THE NATURE OF THE SO-CALLED RHEUMATIC GOUT.

BY A. B. GARROD, M.D.,

Professor of Materia Medica at University College, &c.

THE object of the author in this communication was to demonstrate the distinctive character of gout from rheumatism. He thought each disease had its own special pathology. The name "rheumatic gout" was but a cover for our want of knowledge of the precise affection under which a patient might be labouring. The characters of the acute forms, whether of gout or rheumatism, were distinctive enough; but the case was different when, from repeated attacks, the symptoms had lost all their pristine characteristics. In another paper, the author had thrown out the suggestion that the diagnosis of gout and rheumatism might, in doubtful cases, be determined by an examination of the blood. He then referred to the "*uric acid thread experiment*," and proceeded to lay before the Society a series of four tables, the object of which was to determine the pathological differences of these two morbid conditions. The plan adopted was to divide the cases into four different classes:—

1. Articular affections, in which was demonstrated the presence of an abnormal amount of uric acid in the blood.
2. Articular affections, in which the absence of uric acid in the blood was shown.
3. Articular affections, proved to be closely connected with urethral disorders.
4. Affections non-articular in character.

The result of this investigation was, that in every case of genuine gout an abnormal amount of uric acid was found in the blood, while in acute rheumatism such was not the condition. The tables contained 177 examinations of the blood, taken from 148 separate patients.

#### TWO CASES OF ANEURISM OF THE OPHTHALMIC ARTERY, CONSEQUENT ON INJURY OF THE HEAD, CURED BY LIGATURE OF THE COMMON CAROTID ARTERY.

BY T. B. CURLING, ESQ., F.R.S.,

Surgeon to the London Hospital.

THE first case related by the author was that of a man aged nineteen, admitted into the London Hospital under the care of Mr. Scott, in 1834, labouring under the symptoms of concussion from a fall down a ship's hold, which was followed by a pulsating projection of the right eye-ball and loss of vision. About a month after the injury, violent arterial hæmorrhage occurred from the nose, and Mr. Scott, who was in the hospital, at once cut down upon and tied the carotid artery. The patient recovered favourably, but vision remained lost. The second case was that of a labourer, aged forty-nine, admitted into the hospital under the care of the author, in March, 1854, on account of a fall, attended with symptoms of severe concussion, and hæmorrhage from the right ear. This was followed by a serous discharge from the ear and deafness, and subsequently by paralysis of the right side of the face. About six weeks after the accident, the conjunctiva of the right eye became inflamed, and the globe gradually protruded, and was shortly observed to pulsate. The patient also suffered from throbbing pain in the head. As soon as vision began to fail, June 2nd, the author placed a ligature on the right carotid artery, which at once arrested the throbbing pain and removed

the pulsating projection of the eyeball. Vision, however, instead of improving was entirely lost on the second day after the operation, and the cornea had become dull and hazy, the pupil being widely dilated. In about a week the cornea became clear again, and vision returned, but remained imperfect, owing to the preternatural dilatation of the pupil. The patient otherwise did well. The author remarks that the history of these cases clearly shows that a severe injury of the head had been the occasion of the formation of an aneurism of the ophthalmic artery. He noticed certain points of difference in the two cases, and considers it probable that in the first case the aneurism was the result of a severe concussion, and in the second that the petrous portion of the temporal bone was fractured, and that by the extension of the fracture to the optic foramen the ophthalmic artery had been wounded by a splinter or detached fragment of bone. The author ascribes the loss of vision shortly after the operation in the second case to changes consequent on defective nutrition from the arrest of the circulation through the carotid artery; but as the proptosis subsided and the circulation became re-established, the eye recovered its nutrition, and sight returned. The preternatural dilatation of the pupil, which continued after the recovery of vision, he considers to be due to the aneurism pressing on the ciliary nerves, and destroying their functions as respects the motions of the iris, producing, in fact, hydrasis. The author concludes by remarking that these cases establish the great danger to vision arising from a traumatic aneurism of the ophthalmic artery, and indicate its sources to be threefold:—1. From pressure on, or traction of, the optic nerve. 2. From interference with the nutrition of the eyeball. 3. From injury to the ciliary nerves. They also show, that to avoid these dangers a ligature should be applied to the common carotid artery at an early period, or soon after the detection of the pulsating projection of the eye.

#### ON WATER-STRAPPING AS A SURGICAL APPLIANCE, AND A PROPOSED SUBSTITUTE FOR THE ORDINARY STICKING-PLASTER.

BY C. HOLTHOUSE, ESQ.,

Assistant-Surgeon to the Westminster Hospital, and Lecturer on Anatomy in its Medical School.

THE object of the author of this paper was to direct the attention of the profession to the superiority of wet-strapping over ordinary diachylon plaster in the treatment of ulcers and certain cutaneous affections of the extremities, as advocated by Mr. Chapman, and to recommend its adoption in injuries and diseases of the joints, and in dressing stumps after amputation. The advantages of this application over plaster are—

- 1st.—Its innocuousness, being entirely free from the irritating effects of the latter, and never producing inflammation of the skin, or the eruption of pustules or vesicles.
- 2ndly.—The comfort the patient experiences from its application.
- 3rdly.—Its cleanliness.
- 4thly.—The ease and quickness with which it is removed, from its not adhering to the hairs of the part.
- 5thly.—Its cheapness.
- 6thly.—It may be made the vehicle for the application of remedies.

The material made use of may consist of linen or calico, bleached or unbleached, and the older it is, provided it be not rotten, the better it answers the purpose. It must be cut or torn into strips of varying length and breadth according to the part to which it has to be applied; the strips must then be immersed in water till thoroughly saturated, when they are fit for use. If the disease to be treated be an ulcer on the leg, the strips should be about two inches in breadth, and of a length exceeding somewhat the circumference of the limb; they should then be applied exactly in the same manner as plaster, each piece overlapping a portion of the one immediately below it; in fact, the directions given by Mr. Baynton for strapping up the limb may be strictly followed in the application of the water-strapping, save and except that his directions to remove the hair from the part may be dispensed with; a roller must afterwards be applied in the ordinary manner.

Four cases in illustration of this method of treatment, and of its beneficial results, were then given; one being an ulcer of the leg of fourteen years' standing, that had resisted repeated attempts to heal it at other hospitals; another, a case of eczema impetiginodes, affecting both lower extremities, and of three years' and a half duration; a third was a case of a crushed thumb, followed by gangrene and subsequent amputation; and the fourth was an amputation of the thigh, for extensive disease of the knee-joint and upper third of the leg.

## NORTH LONDON MEDICAL SOCIETY.

WEDNESDAY, JUNE 14, 1854.—DR. HARE, VICE-PRESIDENT,  
in the Chair.

MR. W. J. ANDERSON read a paper

## ON SOME CASES OF OBSTETRIC PRACTICE,

and commenced with a description of uterine hæmorrhage, more particularly dwelling upon that which arises either from partial or complete placenta presentation; and alluded to the latter, because certain modern innovations with regard to practice had been proposed, and which appeared to him fraught with the greatest danger. The author urged the necessity of speedy delivery, by turning, the moment it could be accomplished, and recommended that the hand should be introduced into the uterus, either by detaching the placenta from the walls of the uterus, and entering the membranes beyond its edge, or by boring the fingers right through the substance of the placenta itself, the mode of operation varying according to the nature of the case and state of the patient. He then stated, that the removal of the placenta, in such cases, before the birth of the child, had of late years been advocated, but such an operation appeared not only inadmissible, but really frightful to contemplate. It was to be remembered that two lives were at stake, and certainly no rash undertaking should be had recourse to, for the sake of experiment, in such dangerous cases. The removal of the placenta under such circumstances must be attended with the greatest danger to the mother, and, in addition to this, it must, in the majority of instances, insure, to a certainty, the death of the child. The temporary lungs of the child are removed, and, let the operator be as expeditious as he will, in all probability the child will be dead before he can extract it. The use of chloroform was next adverted to, and the author maintained that it was totally inadmissible in obstetric practice, for why should such a beautiful process as natural labour be interfered with, and a favourable case be possibly converted into one of imminent danger? Or why, in an operative case, should the patient be put in the greatest peril, by being placed under the full action of this agent, merely for the sake of avoiding a little extra trouble on the part of the practitioner, and a little extra pain or fear on the part of the sufferer? Two cases were then cited, in which (the patients being under the full action of chloroform) the presentation receded, just as if the uterus had been ruptured, and this organ became completely paralyzed, like a large, loose sack. In both cases the patients were delivered by turning, but the relaxed condition of the uterus remained until the effects of the chloroform passed off, clearly showing the inevitable danger which must have ensued if hæmorrhage had come on during this period. Dr. Robert Lee's cases of insanity, occurring after the use of chloroform during labour, were alluded to, and this led to the consideration of insanity, taking place during pregnancy and after delivery. An interesting case was mentioned, in which the attack showed itself almost contemporaneously with conception, and assumed a low form of monomania, accompanied, in the first instance, with a suicidal, and, subsequently, a homicidal, tendency, the whole train of symptoms passing off when quickening took place. It was then remarked, that it is a circumstance very much to be lamented, that the study of insanity is, in the majority of instances, totally neglected. How many frightful crimes, how many melancholy events, might be avoided, and how many families might be saved from being plunged into irremediable grief, by the early detection of an attack? It is a sad reproach, but in very many cases the public are quite as competent to give an opinion as medical men. Matters should be different. The study of insanity, not by book, but practically, in a lunatic asylum, should be imperative, and should necessarily form a part of every student's examination. To the accoucheur, a competent knowledge of this complaint must be of the most essential service, inasmuch as women are much more prone to it than men, and frequently from causes to which his attention is particularly directed—viz, menstruation, pregnancy, parturition, and lactation. Cases of puerperal insanity, moreover, bear a large proportion with regard to those arising from other causes. Some statistical tables were given, by which two important facts were proved—first, that insanity is of far more common occurrence in the female sex than the male; and, secondly, that commoner though it is among females, a much larger number of them recover from its effects than males.

**SURGEONS FOR THE EAST.**—Assistant-surgeons Williams and Sherlock, of the first battalion of the Rifle Brigade, have gone by the *Himalaya* to join their corps at Varna.

## Reviews and Notices of Books.

*L'Huile de Foie de Morue, envisagée sous tous les rapports comme Moyen Thérapeutique.* Par L. J. DE JONGH, Docteur-Médecin à La Haye. Paris: Librairie de Victor Masson, Place de L'Ecole-de-Médecine, 17. 1853.

COD-LIVER oil has become one of the most generally prescribed and popular remedies of the day, and there are but few medical men who have prescribed it largely who do not bear witness to the benefit very frequently derived from this remedy, especially in cases of scrofula and phthisia.

The work of Dr. de Jongh is highly interesting and important, as it treats fully of this remedy in all its bearings and relations. It gives the history of its medical employment, furnishes extensive and complete analyses of the different kinds of cod-liver oil, and it treats of its therapeutical action.

The composition of genuine cod-liver oil is not so simple as might be supposed. Dr. de Jongh has discovered in it an organic principle which he terms *gaduline*, as well as the following constituents:—*Oleic acid, margaric acid, glycerine, butyric acid, acetic acid, fellicinic acid, cholinic acid, bilifellinic acid, bilifuloic acid, iodine, bromine and chlorine, phosphoric acid, sulphuric acid, phosphorus, magnesia, and soda.*

After a careful examination of the different kinds of cod-liver oil, Dr. de Jongh gives the preference to the light-brown oil over the pale oil, which contains scarcely any volatile, fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of cod-liver oil no doubt partly depends. Some of the deficiencies of the pale oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale oil we fully concur.

The chapter devoted to the adulteration of cod-liver oil is a very useful and practical one. Under the head of "falsifications" of cod-liver oil and the means of recognising the genuine oil we meet with the following remarks:—

"It is certain that oils, which are anything but the oil of the liver of the cod, are often sold as such. These oils are sometimes fish-oils, purified; sometimes mixed with iodine or iodurets; sometimes mixtures of genuine cod-liver oil with ordinary fish-oil, or oil of olives, or of poppy.

"The total absence of iodine, observed so often in the analyses of cod-liver oil, proves not only that these falsifications are practised, but also that often the true cod-liver oil does not constitute any part of these mixtures."

Fortunately we possess in sulphuric acid a simple re-agent by which genuine cod-liver oil is easily distinguished from most other kinds of oil: a few drops of this acid produce, in olive oil, a dirty grey colour; in poppy-oil, a deep yellow colour, approaching brown; and, in ordinary fish-oil, a deep brown colour; while, poured drop by drop into cod-liver oil, sulphuric acid produces in it a centrifugal movement, particularly where the drops fall, and, at the same time, a beautiful violet colour, which changes to purple the moment the mixture is agitated, and, ultimately, to a rich sienna brown. This colour is no doubt due to the action of the sulphuric acid on the constituents of the bile contained in the oil. The action of the re-agent is best seen by adding one or two drops of concentrated sulphuric acid to about half a teaspoonful of the oil, spread out upon a white porcelain plate.

Dr. de Jongh points out the method by which other falsifications may be detected, particularly those with iodine and iodides.—See page 150.

We have carefully tested, in the manner directed, a specimen of the light-brown cod-liver oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile. A few drops of concentrated sulphuric acid produces a beautiful violet colour, quickly passing, on agitation, to purple, and, ultimately, to a deep rich sienna brown.

# THE LANCET.

LONDON: SATURDAY, JULY 29, 1854.

THE feelings of anxiety and indignation which pervade the profession, in consequence of the verdict which was returned at the late inquest on ALFRED RICHARDSON, could not be easily described. The agitation of the professional mind is universal: it affects all ranks and classes of the profession, and every practitioner feels that he cannot carry on his professional pursuits without being placed in a situation of the most extreme danger. All honourable men are asking how they are henceforth to be protected from the plots of traitors and spies within their ranks, and from the prejudices and blindness of unscientific persons acting as jurymen. All agree that something must be done to avert the threatened consequences of a verdict that is contrary to law, in direct opposition to the evidence, given directly in the teeth of the facts of the case, and consequently directly opposed to equity and justice. Thus far one of the intended victims has received the prompt and hearty support and protection of the governing body of the institution of which he has been so many years an honourable, efficient, and an able medical officer. Mr. WEEDON COOKE, on the day after the verdict was returned, sent in his resignation to the committee of governors of the Royal Free Hospital, who, however, on the 24th instant, unanimously resolved that Mr. COOKE should be requested to retain his office as one of the surgeons of the hospital. The savages, therefore, who sought to destroy this excellent man, lose a portion of their prey.

The preliminary meeting intended to have been held at the Freemasons' Tavern, on Tuesday last, to take the subject of the verdict into consideration, was postponed in consequence of the numerous complaints respecting the hour fixed upon—eight P.M.—and because there also existed some undecided legal questions, which made it inexpedient to discuss subjects in connexion with some of the late judicial proceedings. It was further objected, that the chief purpose for convening the meeting had not been sufficiently defined. It is now intended to convene the meeting about a fortnight hence, and the chief object of holding it will be to determine on the best measures to be adopted for shielding the profession from the effects of a verdict which threatens it with danger, torture and ruin.

There is a feeling of brotherhood which unites the individual members of every honourable profession into one body. Every man who enters such a profession contracts an obligation towards his new associates that he will do nothing to throw discredit upon the profession of his adoption. Of course there are limits to this obligation. A man is not bound, out of an overstrained deference to professional feelings, to submit to personal wrong, or, by a cowardly silence, to connive at the infliction of wrong upon others: nor is he bound to ignore, and by ignoring to support, those abuses which are but too apt to

grow up in every community, and which may be inconsistent with the public good. Many treatises have been written for the purpose of laying down with precision and authority the relative duties of medical men towards each other. But we apprehend that elaborate disquisitions, and nicely-drawn rules, are scarcely necessary. All rules of this kind that are deserving of respect flow from one governing principle—at once the highest and the most sacred in the moral world—Do unto others as you would that others should do unto you. He who is animated by this principle will not be found wanting in that sense of honour and propriety of conduct which mark not only the circumstances of professional intercourse, but also the bearing of gentlemen towards each other.

The feeling that an honourable *esprit de corps* is both useful and becoming in a professional body is universal. What is the aspect of the late inquest that—apart from the odious nature of the charges advanced, and which, having been utterly disproved, afford little occasion for comment—has most shocked the public mind? It is that aspect which exhibits some members of the medical profession vindictively persecuting their professional brethren.

It is in this respect that the deepest injury has been inflicted upon us. For many years the profession has been earnestly struggling, by means of associations, and by individual exertions, to advance the claims of Medicine to a more just and useful appreciation by the public and the legislature. But how can that profession urge its common claims effectually which is open to the reproach of being untrue to itself?

Those who have given this occasion for scandal—who have proved recreants and traitors to the common cause—have a heavy account to settle with the profession. It is difficult to conceive anything more humiliating, or more deserving of execration, than the spectacle of one professional man ferreting out occasions for impugning the professional skill of his brethren, and instituting criminal proceedings against them. It is not to be expected that persons so lost to all sense of honourable feeling should be scrupulous as to the means of promoting their ends. Bad ends and questionable means bear a pretty constant relation. Treason is naturally wrought out by treachery. It is not, however, for the purpose of aggravating the enormity of the outrage against the medical body, perpetrated in the getting up and conducting the late proceedings, that we now think it our duty to comment further upon a case which, in the eyes of all honourable men, already reveals depravity enough; but we do think it may serve a useful purpose to illustrate the treasonable character of this plot, by pointing to some features of the evidence.

That one surgeon should instigate a prosecution against another surgeon for a presumed failure in an operation,—for we again insist that, so far as JOHN GAY knew anything of the operation performed by Mr. COOKE, at the time when he was labouring to convict his late colleague of malapraxis, the failure was only presumed,—is a treasonable act against the profession, every one will admit. If the act itself was conceived in treachery, so was every succeeding step by which it was sought to substantiate the charge equally traitorous. In estimating the character of this charge, it is important to bear in mind what are the feelings and prejudices of the mass of the public, including many of the educated classes, as well as the uneducated. No one of us is ignorant how easily all the low passions, the absurd suspicions, and vulgar prejudices of the public can be excited against the

medical profession. No inconsiderable proportion of the people is ever ready to lend a credulous ear to every tale of slander against a medical practitioner. It is almost a matter of faith with not a few that the poor are habitually "experimented upon" in hospitals. Any blockhead may at any moment "get up" a storm of popular indignation against a hospital surgeon, upon the most slender foundation. Indeed, for a purpose of this kind, the less of truth the greater the success. That such were the feelings appealed to in the late proceedings, no one will question, if he consider the object of those proceedings, and the means employed to accomplish that object. From the beginning to the end no opportunity was lost of obscuring the sufficiently-limited intellects of the jury by playing upon their prejudices. Thus Mr. BALLANTINE was instructed to say, that the "parents decided that the body should not, on any account, be opened; but when it was carried home, they found it had been opened and sewed up again." Now, we will not say but that, if the parents had urged this objection this was a prejudice which might with propriety be disregarded. But we will refer to the evidence of MERRER, the house-porter, who heard the father give his assent to Mr. SCORRELL for the examination of the body.

Further on, we find JOHN GAY deliberately stating "the operations have to be performed on the dissecting-table where putrid bodies are placed." Questioned upon this statement by the Coroner, JOHN GAY further says—"I refused at first myself to operate upon that table until I received an order from the Committee, with a view to throw the onus upon them." From this confession, and on this flimsy pretext, it would appear that JOHN GAY has performed operations under circumstances in which he knowingly exposed his patients to the imminent risk of purulent infection and death! Does the onus of such conduct rest on the Committee or on JOHN GAY? But we think it right, in justification of the Committee, to observe that the assertion is unsupported by any other testimony. We know, from our own observation, that the hospital is duly supplied with a special operating-table, and that the necessity of operating upon a dissecting-table "where putrid bodies are placed" has never arisen. But we have no doubt this revelation by a surgeon, from his own experience of "what those doctors do to the poor people in the hospitals," had the effect intended.

Such were the despicable arts by which it was sought to inflame the minds of a prejudiced, ignorant jury, and to extort a verdict which it was hoped might be fatal to the professional prospects of two meritorious surgeons.

It is not often that we feel called upon to remark upon anything that our contemporaries may say or do, with the hopeless object of raising their circulation at the expense of that of THE LANCET. The form, the headings, the leading features and departments of this journal, the very type, have been successively imitated; and in accordance with an invariable law, observed in the proceedings of those who seek for public support by practices of this kind, we have been abused in proportion to the extent of their obligations to us. But the two journals to which we devote a little of our space to-day, have lately given a sample of what they can do in the way of originality. The course they have adopted in regard to the late inquest is characterised by a certain degree of ingenuity and independence, for which we are anxious to give them credit. That the respective

editors are somewhat disappointed by the failure of that infamous attempt to damage ourselves, it would not perhaps be charitable to assume: that they are really disappointed in their natural anxiety to turn the matter to account, we feel no scruple in assuming. We remember, with gratitude, the amiable alacrity they displayed, in circulating what the profession would not pay for—dreary columns of the trashy abuse poured out against us in Hanover-square. It will not be altogether uninteresting to examine the tactics of these worthies on the present occasion, and to see in what a complimentary way they now estimate the intelligence and professional spirit of their unfortunate readers.

Both of these journals showed a very disinterested anxiety to fan the exertions of those who were busy in instigating the inquiry. "*The suppressed inquest*" figured in prominent letters in their columns. They gave what countenance they could darkly convey, without using terms which would render them amenable to those laws of which one of them has had recent experience, to the odious accusation that the Coroner for Middlesex had shown corruption in his office. They knew the accusation was false, but they wished it might be believed. The result of the inquiry has been to scatter this imputation to the winds. Those who had the conduct of this persecution—for such it must be called—took infinite pains at the beginning of the case to strengthen the suspicion that had been so malignantly raised. It was the very pith of the representation made to Lord PALMERSTON. The suspicion once set afloat, pains as great were taken to prevent the opportunity of defence. It was difficult to believe that baseness enough could be found, beyond the prime conspirators in this transaction, to carry on a policy so unworthy and malevolent. But the profession has had to endure the yet further outrage of seeing this policy taken up by the Editors of two medical journals. The *Medical Gazette*, not slow to favour the slander so long as it could not be contradicted,—now that the accusation has been proved to demonstration to be as false as the hearts of those who invented it,—passes over the wrong to the judicial character of the Coroner for Middlesex, and jesuitically professes to confine its attention "to the strictly medical part of the question, and refrains, as the jury have done, from all comments on the alleged attempts to suppress the inquest." The candid Editor grows suddenly scientific and evangelical. He criticises the operation; advances the monstrous doctrine that the assistant at an operation is, like the operator himself, responsible for the success of the operation; exhausts his ingenuity in attempting to justify the jury in identifying Mr. THOMAS WAKLEY with the operation; and concludes by a miserable cant about retributive justice, his notion of justice being that it is right and fitting to blast the professional reputation of Mr. THOMAS WAKLEY, not because Mr. THOMAS WAKLEY has sinned, but because many years ago THE LANCET admitted into its pages the reports of two unsuccessful cases of lithotomy.

We will not insult any portion of the profession by supposing that such homilies, or such morality, are to their taste. Nor do we advert to the harmless labours of our contemporary because we feel any disappointment at not receiving that candid acknowledgment, that he had for a moment given something like currency to a calumny, which common honesty would have prompted. But that such a course, so marked by meanness, and so calculated to injure the profession in the public esteem, should be adopted by a journal circulating, to however limited

an extent, amongst medical men, is a circumstance that cannot be passed over in silence.

But the journal conducted under the auspices of the Provincial Medical and Surgical Association must be considered in a different light. It cannot be for a moment presumed that the eminent and respectable medical practitioners to whom that journal belongs have any interest in the propagation of slander. Should the *Journal*, under its present management, ever attain the improbable position of paying its expenses, the subscribers can receive no dividend. The publication, at length, of the *first part* of the recent proceedings, containing all the slander, carefully holding back, as long as possible, the refutation, was not undertaken for profit. Was it done to enhance the scientific value and moral character of the *Journal*? Or are the weight and respectability of the Provincial Medical and Surgical Association assigned over to the Editor? Is their *Journal* committed to his hands to enable him to use it for the destruction of the character of his professional brethren, and the gratification of private malevolence? Let the Association consider well to what extent they are committed by the acts of their Editor. Once before he sold their *Journal*, and perverted it to uses alike remote from science and opposed to the feelings and interests of his employers. In January last, Dr. CORMACK thought it becoming and just to bring out an "indignation edition," devoted to a full and particular account of the meeting at Hanover-square, summoned for JOHN GAY! It need not now be said that that report contained, and could contain, only one side of the question. It was intended, with generous disinterestedness, to circulate that number *gratuitously* throughout the profession. A natural anxiety was felt by us to send a calm statement of the facts, along with the *ex-parte* statements of the *then* supporters of JOHN GAY. We are not in the habit of circulating gratuitous editions, after the manner of our contemporaries, with a view to make a figure in the stamp returns. It was thought not unreasonable to ask the impartial CORMACK to insert our own defence in the accusing columns of the *Association Journal*. We invite the attention of the members of the Association to his reply. *He had sold the entire edition, and had no control over it!* The *Association Journal* had been bid for as the vehicle of slander, and the Editor had sold it. But for the small charge of "five guineas" we might insert what we wished in the form of an advertisement! *Verbum non amplius*. Such is the plight of the *Association Journal*!

ESSENTIAL as must be a medical staff to every military or naval force, important as must be the aid that medical science can bring to the success of every enterprize that has to be carried out by masses of men, if we were called upon to point out one sphere in which a band of able and zealous surgeons was pre-eminently important, we should name the British possessions in India. For many years the East India Company never lacked a body of medical officers distinguished for their ability and remarkable for their zeal. It is not too much to say that the moral power and dignity of the British name—the strongest and the most durable basis of the sway we hold over so many millions of men differing from us in race, language, customs, and religion—has been as much advanced in India by the labours and example of our profession as by those of any other. The blessings dispensed by the medical practitioner fall upon all alike—upon friend and foe, upon Christian, and Mussulman, and Hindoo. He knows no caste;

the Brahmin and the Pariah have an equal claim upon his beneficent ministrations. Amongst uncivilized or half-civilized nations, Medicine must ever be the most humanizing of all professions. Nowhere has this truth been more strikingly displayed than in India. The soldier subjugates by force; the statesman rules too often by oppression and unequal laws; the judge cannot hold the scales of justice even unless attended by an armed force; the minister of the gospel, though animated by the zeal of the early martyrs, cannot hope for more than the most partial success. The good deeds of the physician are unalloyed by oppression, by violence in any form, either to customs, to prejudice, or to religion. What is so near akin to that mercy which blesseth him that gives and that takes as that divine art which, with universal love, seeks to relieve the sufferings of all mankind?

That it is a rule of soundest policy to attract men of superior character and attainments to the Indian Medical Service will not admit of doubt; and many illustrious names,—witness ANNESLEY, MARTIN, ALLAN WEBB, and others,—testify to the fact that such men have been attracted to it. But of late the policy of the Company towards this most important branch has been unwisely, unaccountably, and, we will add, most unjustly, altered. The matter was ably brought forward at the late Court of Proprietors, and the case so admirably stated by Dr. BURNES, that we cannot do better than quote the following extract from his address:—

"In 1796, when the Indian army was assuming the important character it now possesses, the Medical Department was officially declared by the Court of Directors to be an integral portion of it. Liable to the same dangers, and to more than the same fatigues and exposures, the right of its members to rank, quarters, pay, and pension, relatively with military officers, was freely and fairly conceded. The same just principle was again enunciated in the Court's despatch of the 5th of February, 1823, wherein it was unequivocally expressed that no distinction should exist betwixt the Military and Medical branches, but that the one should enjoy proportionate advantages in common with the other. And so for forty years the united departments proceeded *pari passu*, the officers of each retiring on the pension of the grade which they had respectively attained. In 1838, however, the Home Government granted to military officers pensions by length of service, as well as by rank, giving them an option to choose between the two, but without including their medical brethren in the boon, and when the latter prayed for a similar favour, they, strange to say, granted the pension by service, but withdrew that by rank; thus drawing a marked distinction between the departments, rendered more galling by the fact that the avowed object, as respected the military, was a gracious intention to raise, so far as pension could, the unfortunate in promotion to a level with the fortunate, while the manifest design, in regard to the medical service, was to bring down the lucky to the standard of the unlucky; or, in other words, because one branch of it had been slow and supine in its rise, another, which had mounted the ladder with an active step, was also to be brought down to, and retained at, zero. Could any legislation be more mistaken, or disheartening?"

"But the singular anomaly did not end here. In every other case where innovations injurious to individuals had been introduced, they were only to affect new comers, and not those already in the service. Take, for instance, the new rules as to the pensions for chaplains, dated August 31st, 1836, those for veterinary surgeons, dated May 2nd, 1861, by both of which it was clearly defined that present members were not to suffer; and, again, those promulgated in the present year for chaplains, prolonging their pension period from fifteen to seventeen years, but guarding religiously the interests of actual incumbents. While strict justice was thus being administered to other departments, the Medical Service was told that for ten years from July, 1842, its members might retire either under the old or new rules; but that in July, 1852, the latter were to become absolute. This narrow concession might reconcile the seniors to the change, but its practical effect was, by a stroke of power, to alter arbitrarily the conditions on which several hundreds of valuable public servants had accepted the employ of Govern-

ment,—men who, without any disparagement to the ecclesiastical and veterinary departments, had done their duty as well as they, and were as much entitled to the consideration of their masters.”

We are unwilling to doubt, that claims so well established on every principle of justice and of policy, and advocated by a man who has himself reflected so much credit upon the Indian service as the late Physician-General to the Bombay Army, will meet with just consideration.

The expediency of this course will be the more obvious to the Directors, if they reflect that, at the present time, it is in contemplation to open up the access to their service to merit, in preference to mere influence. But men of merit are not slow to discover proper fields for their exertions, and it will be well to consider whether, if the Indian Medical Service be not placed upon a footing honourable to the profession, that service may not be *tabooed* like the Royal Navy. The claims of science are being every day more and more widely recognised; it will soon be impossible to maintain that invidious and injurious policy which seeks to degrade the Medical Profession below any other.

## INQUEST

ON THE

BODY OF ALFRED RICHARDSON, WHO HAD  
DIED AFTER THE OPERATION OF LITHOTOMY.

### VERBATIM REPORT OF THE SUMMING UP OF THE CORONER.

GENTLEMEN OF THE JURY,—After ten days of heavy duty, the time has at length arrived at which it becomes my task to sum up the whole of these proceedings, and to lay before you the evidence which has been given by the witnesses in this most anomalous, but at the same time most important and difficult case, involving, as it has done throughout, matter of the deepest interest, and at the same time of the most afflicting, painful, and, I may add, disgusting character; and by far the greater portion of which consists of extraneous subjects foreign to the inquiry you are especially called upon to enter into,—namely, *the cause of the death of this child*, and foreign as being subsequent to it.

I feel sure, gentlemen, that under such circumstances, (and I am strengthened in that assurance by the deep attention you have paid to the whole of the facts laid before you throughout, and which I need therefore hardly recapitulate,) that you will give your undivided, cool, calm, and patient attention to the observations I shall feel it my duty to address to you, and the cases I shall have occasion to refer to; and, in my turn, I promise you that they shall be as brief as the nature of the subject will permit, more particularly as I shall occasionally have to observe on the evidence laid before you as I proceed.

I must first, gentlemen, entreat of you to discharge from your minds every syllable which has reached you out of the walls of this court, and confine yourselves solely and exclusively to the evidence, and *calmly, coolly, and dispassionately*, according to the solemn oath which you have taken, which is, “to diligently inquire, and a true presentiment make, of all matters given you in charge *touching the death of the deceased*.” For I feel it my duty to state that if in your verdict you exceed that, you do but exceed your duty, and may render yourselves open to censure, and perhaps to legal proceedings, as I will presently show you by reference to a case recently decided by the late Chief-Justice Lord Denman, one of the ablest judges of the superior courts.

And here, gentlemen, I cannot refrain from alluding to the strange and anomalous proceeding which has brought within the verge of this court, not only a gentleman learned in the law, sent here at the express desire of Lord Palmerston, her Majesty's principal Secretary of State for the Home Department, to watch over these proceedings, but I am happy to add, also, seeing their nature and difficulty, that he has been pleased to denominate himself as a sort of assessor to me,—as the judge in this inquiry, (and for whose kind assistance throughout I

beg to tender him my most grateful thanks); but it has brought here also other learned members of the law,—one on the part of the parents of this child, who has directed the powerful energies of his mind against the real or supposed authors of an attempt to suppress the inquisitorial powers of this court in its inquiry into the cause of the death of the deceased, by the negotiation for, and the ultimate payment of, no less a sum than £100. And it has brought under this inquiry matter, gentlemen, be it observed, not only of a very serious character as to the cause of the death of this child, but matter subsequent to, and some portion of it nearly two months after, the death of the deceased, and which could scarcely, by any ingenuity or construction, be brought to bear upon that which, as I have already told you, is the only inquiry you have really to direct your attention to,—namely, *the cause of the death of this child*. Thereby it has been rendered necessary that four or five other barristers of eminence should also be called before you, to protect their respective clients, adding much to the length of our proceedings, and the many difficulties which have attended this inquiry; so, indeed, that four whole days have elapsed before the real cause of death was ascertained, or that we were enabled to trace the source from whence the pecuniary funds arose, which were supposed to have issued from some persons connected with the Royal Free Hospital, or engaged in the operation connected with the death of the deceased. This money has since been clearly ascertained to have been the voluntary and free gift of Mr. Steele, the solicitor of Mr. Cooke, the operator, Mr. Steele being also a subscriber to the Royal Free Hospital; but, as it appears from his own statement on oath, advanced by him (Mr. Steele) from his own funds, without the knowledge or consent of that gentleman (Mr. Cooke) or of the committee of the hospital, and without the knowledge or consent also of Mr. Wakley, sen., or myself, or of Mr. Wakley, jun., who was present at the operation as the operator's assistant. The fact has been now amply corroborated by the testimony of the hospital secretary, who also repudiates in the strongest terms, on the part of the committee of that hospital, any participation in the payment alluded to, or in the negotiation for its advance whatever, or in the measure of an arbitration of any kind whatever, or that any license whatever was given to Mr. Steele to compromise the hospital or any of its officers, by providing for their dismissal under any such proceeding, which, indeed, it is absurd to suppose could have had any such operation, had it taken place.

Now, gentlemen, do not imagine for a moment that I feel personally annoyed at this extraordinary intrusion on the generally peaceful and quiet duties of the coroner's court, which is rarely attended by counsel, who are more rarely allowed to address juries. On the contrary, it has operated as a great relief to my mind, in the discharge of the arduous duties that I perform, not to be clogged or embarrassed by the defence of parties supposed to be implicated in these transactions, who have thus been so powerfully and ably defended by their respective counsel, in the cross-examination of the witnesses; although I regret extremely, that they have one and all retired from the more arduous and important duty of addressing you, as I should have permitted them to have done, in reply to the observations and serious charges preferred by the learned counsel, Mr. Ballantine, on the part of the parents, at the commencement of these proceedings. Their motives for the course taken by them have been publicly advanced by them in court. I presume they have taken that course, on the clear case made out in evidence, that they have no observations to make, and that they are thoroughly satisfied that it fully appears to you, on that evidence, that each of their respective clients is free from any charge; at any rate, any charge of a legal or criminal nature. I cannot for a moment suppose it was intended that *their* defence should rest on my shoulders, and that I should bear that additional incubus to the one by which they are already encumbered. All that I can do on their part is to make such observations on the evidence as bears upon them, and as the circumstances stated appear to warrant. They must have been satisfied that the conduct of their clients stood in no need of their eloquent advocacy, and I own, as far as any legal or criminal charge can extend, I come to the same conclusion from a knowledge of the law I shall soon lay before you.

So far I am satisfied, then, with what has occurred; and I shall only make one further observation upon it, which is this, that I could have wished that the discussions during the evidence had been conducted with a better temper than has been displayed throughout, and that the dignity of the coroner's court had been more respected and better sustained. I sit here as the representative of her Majesty, in the administration of

the law, and considering that this court has existed from time immemorial, that its very origin is lost to the history of this country, that it has remained unscathed for a great many centuries amidst the wreck and downfall of other institutions, and that it erects its head at the present day as a proud bulwark of the wisdom of our ancestors, and affords a sure and invaluable haven of refuge for the lives, liberty, and security of her Majesty's subjects, it surely has some title to respect and veneration.

Gentlemen, if I had had an opportunity of an interview with her Majesty's Secretary of State before I was called to enter upon this inquiry, I think I could have satisfied his lordship that other means, and those by far more effectual than the coroner's court, could have been adopted, to meet and grapple with the many grievous and weighty matters which have been submitted to your judgment; that all I should then have been called upon to do would have been to procure and impound, as I have done, the documents which have been handed in, for some future inquiry in another court, and that complete justice, which cannot be administered here in such an inquiry as this, might be elsewhere brought home to any one, if culpable, either by a motion for a criminal information, by an indictment preferred for a misdemeanor or conspiracy for the means taken, and the attempt made, to suppress the inquiry in this court as to the cause of death of the deceased, or by some other legal course, not necessary for us now either to inquire into or define.

However, gentlemen, now it is nearly over, I may express my entire satisfaction that the inquiry has proceeded on the broad basis it has done, and that no attempt whatever has been made, at the last hour, to prevent the largest possible investigation into the conduct of every one implicated in these transactions; because I feel now satisfied and convinced that neither Mr. Wakley or myself have ever been in the slightest degree instrumental in suppressing the former inquiry, but, on the contrary, that every prudent care and attention was used on his part to set the inquiry on foot—firstly, by gaining the necessary preliminary information as required by the magistrates, as to the facts and witnesses (I am speaking as to the intended inquest on the 17th of May last); secondly, by ordering the room at the "Wheatheaf;" thirdly, by issuing his warrant for disinterring the body for the purpose; fourthly, by Mr. Coulson being called in by him to make a *post-mortem* examination; and fifthly, by previously appointing me to hold the inquest, on account of the very peculiar circumstances in which he (Mr. Wakley, sen.) was placed, as a member of the Royal Free Hospital committee, and the father of an assistant to the operator. All of which, as far as I have observed, was completely accomplished, and no attempt whatever made to prevent the inquiry, until, at the very last moment, after two peremptory demands for an inquest, down came the important document, (No. 3,) from the father of the child, which has been read to you during the evidence twice over, abandoning the inquest altogether.

You will observe, gentlemen, that down to that moment not a syllable whatever was said by Mr. Wakley, sen., or to myself, of any negotiation having been entered into for stopping the inquiry, or of any money whatever having been paid for that purpose; and this is now completely established by Mr. Steele's clear and elaborate statement. Sitting here as judge in this case, I may solemnly declare to you that the very thought of money having passed then never crossed my mind, nor had I the slightest knowledge that the stopping of the inquest by the parents was based on any pecuniary arrangement whatever. The document (No. 3) appeared to be the most perfect of its kind in all respects. It bore upon the face of it not only the consent of the parents, but the acquiescence of the solicitor also, and was based on the only ground on which it could have been put an end to—the letter containing these remarkable words, under the father's hand, "I am quite satisfied with the medical gentlemen's testimony respecting the death of my child." Nothing could be more complete, nothing more satisfactory; and I felt no difficulty whatever, on receiving it, in assenting to its withdrawal. What transpired after that was not communicated to me. The wife appears to have been afterwards dissatisfied, and further communications were made, which it is hardly necessary for me to trouble you with. According to Mr. Brent's evidence, and Mr. Evans's clerk's evidence, it appears, however, that some message was to have been sent to Mr. Wakley if the inquest was to proceed; but no such message arrived, and, as appears by Mr. Evans's statement, no such message was sent, and the inquest was dropped at that time; and Mr. Wakley, senior's, testimony, I hope, sufficiently sets this matter at rest. My own opinion is, that he has exercised a sound judgment in the

course he has taken, and that he could not properly have acted otherwise than he has done. If I had then been applied to a second time, after the solemn act of abandonment by the parties, I should still have hesitated. I should then have suspected, as it appears he did, that some engine had been at work to set the machinery again in motion, it might be for the purpose of establishing a case for an action for compensation under Lord Campbell's Act, which alone would form no ground for inquiry in this court, all parties being, as they expressed themselves, from the medical gentlemen's testimony, fully satisfied, as appeared by the documents, as to the real cause of death. It now appears, from Mr. Evans's evidence, that some such expectation had been opened to them in his intention to take out administration to the son to enforce the claim, and no doubt the £20 is thrown aside and repudiated as standing in the way of obtaining more enlarged damages. Mr. Evans, in his evidence, distinctly says, "There was no message after that sent to Mr. Wakley to hold the inquest. I thought I had done my duty to all parties, and the matter was at an end." So that it was clear that the parties had closed the inquiry then, and not Mr. Wakley or myself. What has since transpired to render necessary this inquiry on the 17th of June last, one month after, has been fully detailed.

It appears that fresh solicitors were employed by the parents, no doubt under the auspices of Mr. Webber or Mr. Courtenay. They called upon Mr. Evans to deliver in his bill of costs, and hand over to them the whole of the papers. That he afterwards delivered his bill, amounting to £85 6s. 4d., in which the whole transactions were unravelled: the receipt of the £100 admitted to have been received from Mr. Steele; the £20 paid to his clients to cover their expenses, as previously agreed on; and the £80 retained by himself to cover his own costs.

A more extraordinary bill of costs than this I think I have never seen, in a tolerably extensive practice, extending over many years; and I think I may add a more disgraceful transaction throughout was never disclosed. The whole bill, which has been given in evidence, may be seen by you if you desire it; but there is one item in it to which I particularly desire to draw your attention. It is that which relates to the time of the operation, which he assumes to have been one hour and forty minutes, first by Mr. Cooke, and then by Mr. Wakley, jun., and in which he charges £5 5s. for waiting on professional gentlemen to ascertain if it was usual for one operator to perform first, and then another. It now turns out from Evans's own statement that the only source from which he derived this information was from Mary Rosser and the nurse, from what one had told the other, and the other had told him; whereas it appears, from the more authentic sources, that it all lasted short of an hour. It appears that Mr. Webber (whom Mr. Parry has described, whether justly or not I cannot say, as Mr. Wakley's most bitter enemy—I presume as a rival journalist in the medical department; I hope not otherwise) got by some means or other a clue to this matter; that he called on the parents, obtained full information, took the matter out of their hands, and made a statement of all the facts, in writing, which was delivered by a Mr. Courtenay to Lord Dudley Stuart, the respected member for the borough of St. Marylebone, who delivered the same to Lord Palmerston, her Majesty's Secretary of State, by whom this inquiry was then ordered. All I hope is that this proceeding will not be considered as any precedent for a Coroner's Court to act upon in future; for I consider it, as regards all this extraneous matter, to be entirely alien to its original constitution and purpose, which is confined to the cause of death, and should by right have been taken a day or two after it, and ought to be now so considered, as then taken, long before any of the extraneous matter had occurred. Taken at this late period, it is still voidable in law, and may be quashed on affidavits of the circumstance of the body not being in a state to be viewed by the jury. The law is so laid down in "Jarvis's Coroner," in a case there quoted. (See 1st Str. 22; 2 Hawk., P. C., c. 9, sec. 24.)

[Here the Coroner read extracts from the annual lectures of Sir Astley Cooper, delivered at St. Thomas's Hospital in 1824, (*vide* fol. 316, 317, 318, and 319, of THE LANCET, vol. ii.,) and cited the several law cases in Baker's "Law of Coroner," (fol. 204 to 210,) and then read the other evidence relative to the death of the deceased.]

Now, gentlemen, let us pause for a moment, and see what this case really is. You will recollect, when this case was first introduced to your attention, that Mrs. Richardson, not being satisfied as to the cause of the death of her child, one of the main causes being that she has not had the stone produced, stated that she had employed Mr. Evans to look into the matter. Now, so far from this being the real nature of the case,

it appears abundantly clear from Mr. Evans' statement, and it now stands more fully corroborated by that of Mr. Gay also, that, so far from the parents having employed him, he actually employed them, and made them his clients and instruments to serve Mr. Gay's purpose. That the first engine at work in this great affair was Mr. Gay, the discarded officer of the Royal Free Hospital, and Mr. Gay alone, he at the same time evidently smarting under that dismissal, and clearly intending to rake up some matter or other, as he seems to admit, that he could make a handle of, and the groundwork of an onslaught on the committee for his dismissal, and for certain reports against him subsequently issued, which he describes as libellous, and which he was evidently writhing under since that event took place. That he is recommended to Mr. Evans; that he employs him on a sort of saving commission to "forage out" something that would suit his purpose; and it appearing that this was a case under the hands of the gentleman who had succeeded him, it naturally presented itself as one which might furnish something suitable for the object which he had in view. How Mr. Evans performed his part in these transactions has been so abundantly laid before you during the whole of the inquiry into this matter, that it would be needless to trouble you more about it further than to say, that what he commenced in trickery he amply followed up in cupidity and thirst for lucre; that he has, in forwarding Mr. Gay's views, taken especial care of himself, made merchandise of his own clients, whom he softens down, when they become alarmed about expenses, by saying that they need not be uneasy about that; he would take them upon himself. This they accordingly designate by the term, "doing their business gratuitously," forgetting all the time that he was converting the circumstances attending the death of their child to his own purposes, in running up a bill of costs to an amount beyond all precedent; and he, seeing his way clear in obtaining that, through a certain channel, shrewdly turns round upon his own clients, asks them if they have not been put to some expenses, ascertains it to amount to about £20, receives the £100 of Mr. Steele, puts the £80 into his own pocket to cover his bill, and pays them £20 in sovereigns, delivered in an envelope of so flimsy a texture that the sovereigns were heard to chink as the clerk passed them into Mr. Richardson's own hands, and for which Mr. Richardson thanks him, but says he will see Mr. Evans next morning. No doubt he intended to do so when he felt the small sum which he had handed over to him. But, gentlemen, Mr. Evans had been talking to him before about administration being taken out to the son, and a fresh action arising for further damages and further costs, under Lord Campbell's Act, and no doubt this was the subject in reserve on which an interview became necessary. It was no doubt to come to an understanding that the payment of the £20 was not to close the door to any such further proceedings. Lamentable indeed is it, gentlemen, that persons should cling together to promote such unworthy objects, that the remains of this unfortunate child should be twice exhumed from their sacred deposit for any such base and unworthy purposes.

It is not unfrequently happens, however, under the wise dispensation of an all-ruling Providence, that the hand of man is stayed in its guilty purpose. Mr. Gay, when he made a full discovery of what had occurred, under his unseemly commission to Mr. Evans, became paralyzed when he found the instruments he had set in motion were turning to his own destruction; and he appeared glad enough, ere it was too late, to retire from this disgraceful transaction, before the thunder of the indignation of the whole profession should burst upon his head. However deeply it is to be lamented that Mr. Steele should, without the sanction of the hospital authorities, Mr. Cooke, Mr. Wakley, sen. or jun., or any other person, have paid these parties the sum of £100, it nevertheless clearly furnished the means of putting a stop to this inquiry in May last; and it must be clear, gentlemen, to you, and to every one who has paid any attention to the whole of this case, that it is owing to the parties themselves, and not to Mr. Wakley, sen., or myself, that an end was put to the inquiry in May last. That it was brought before you in June last, seems entirely to have been the work of Mr. Webber and Mr. Courtney, who have rekindled the smoking ashes, which were on the point of extinguishing, and lighting up a fresh fire, have through Lord Dudley Stuart and Lord Palmerston, brought the whole matter before you, with what feelings and with what intentions I leave you to judge and determine. It appears to me not a whit better than those which had preceded them, and it has nothing now to do with your verdict.

Gentlemen, you have both the law and the evidence before you. You cannot fail to have seen by the law, as laid down by the learned judges that to impugn a person in an operation of

this character (in which, like all other surgical operations of a dangerous and difficult nature, the operator is especially protected by the law, or who would dare to tread upon such dangerous ground?) you must discover gross ignorance, gross negligence, or gross want of caution; and where that is not established, a criminal charge cannot attach, and all the witnesses I think, concur in opinion, that it does not arise in this case. All ascribe the purest motives, as well as the most diligent care and attention, to Mr. Cooke, and speak as to his careful conduct throughout. He is young as an operator, but it must be obvious to all of you, that every one must have a beginning, even in the most difficult operations, and Mr. Wakley, jun., observes he was within a hair's-breadth of the bladder, where the incision terminated. You must of course therefore first drive from your minds all notions of accelerating the death of the deceased—an intention which cannot of course apply to such a case as this: far less can you entertain any notion of a case of wilful murder—that is entirely out of the question. Every motive which can operate on the mind of man of that character must be absent in such an operation. There can be no malice aforesaid. The motives of the operator must all lie in the opposite direction. His first care must be to preserve the life of his patient, for that is the very reason why the operation, after due consultation, is undertaken; the strongest desire must exist in the breast of the operator to use his utmost skill, and his utmost diligence and care in so delicate and difficult an operation; not to use too much haste on the one hand, or to be too long in the operation on the other, but still always bearing in mind, that the stone must, if possible, be extracted. If that is not accomplished, two powerful feelings must cross the mind of the operator—one, that the dreadful operation must be again performed at another time, the other, and that not distant, that the child must die under the awful irritation of the stone. His reputation is at stake on the occasion. Mr. Coulson says it may be in three or four months, or it might be a year; but all agree that the stone must be extracted if possible. Nor can it, I think, at all occur to your minds, after hearing the law so clearly laid down by the learned judges, that a case of manslaughter can arise in this case, unless there were the grossest neglect, the grossest ignorance, or the grossest want of caution or due circumspection in the operation. You cannot fail to have observed throughout the evidence the very opposite of all these, in the conduct of Mr. Cooke, the operator in this case. He appears throughout the whole transaction, although somewhat embarrassed—as owing to the untoward circumstance he might be, his knife not having perforated the bladder, which in a child appears to be placed high up, and somewhat differently to that of an adult—to have acted cautiously, but unfortunately to have accidentally slipped and passed his knife in between the bladder and the rectum, which that experienced and skillful operator, Mr. Coulson, (who has written a very able work on "Lithotomy and the Bladder and Rectum," extracts from which Mr. Ballantine has referred to whilst examining his witnesses,) Mr. Coulson tells you, with all his practice and experience, "it might happen to him to-morrow," so hazardous, difficult, and dangerous is this operation. All the other witnesses also concur in praising Mr. Cooke's great coolness, calmness, and preservation of temper; and when, under the embarrassment of not being able to discover and grasp the stone, after all his efforts, who can wonder, under the extreme anxiety he witnessed that the operation should be fully accomplished, that he should have turned round to Mr. Wakley, jun., (who appears to have been the person holding the forceps, sounds, and other instruments which might be required during the operation, as his assistant,) and request him to try and search for the stone? Mr. Wakley, jun., gentlemen, could not for a moment hesitate in complying with such a request, and he accordingly tried, as is admitted, with the sound, but whether with the forceps or any other instrument does not, I think, very clearly appear from the testimony of the several witnesses, though a knife was mentioned by one, who describes his (Mr. Wakley, junior's) share in the transaction as that of an examination, rather than an operation, and who appears to have been only three or four minutes engaged, and who clearly was not engaged in this operation as himself an operator, after Mr. Cooke had been engaged for any such time as forty minutes. Nor does it, I think, appear, according to the evidence, that he was at all engaged longer than was essentially necessary—he says about seven or eight minutes—under the extraordinary difficulty which he must have laboured under had he endeavoured to extract the stone, which he could not by any possibility have grasped, for want of the incision having been made into the bladder by Mr. Cooke. One witness only speaks of a knife, but it might possibly have been covered by the finger, the

witness might possibly be deceived, and it is clear he did not make an incision into the bladder; nor does it at all appear in evidence that he was engaged longer than the necessity of the case required, or that he did not skilfully, correctly, and properly perform his part in this distressing and embarrassing case of difficulty; and I think the case, as opened against him by the learned counsel in his address to you, has, according to my view of it, and more particularly as regards time, been quite unsupported by the evidence. It is not the learned counsel's fault, but the fault of those who have instructed him. He has relied upon his instructions, which have since been discovered to have had their origin from a second, or rather third-hand communication, derived not from a trustworthy source, first originating from Mr. Evans, whose bill of costs states that he was engaged forty minutes after Mr. Cooke,—Mr. Evans himself, as appears by his own statement, having received his information primarily from one nurse, who told another nurse, who told him. Mr. Evans, throughout this extraordinary transaction, does not appear to have been very scrupulous in getting up a case to justify his enormous bill of costs. On this flimsy communication made to him he obtains first an erroneous statement of facts, and then builds up opinions from other surgeons on false hypotheses. Nothing can be more vague and uncertain than the information obtained by him, and you will assign to it the worth it is entitled to in your dispassionate judgment, and no more.

Now, gentlemen, you must take with you as an ingredient in this case, that chloroform—that great boon and beneficent gift of the Creator, sent to shield the wretched patient from excruciating torture under severe operations, was not known until very lately, as to its peculiar sedative power in allaying pain in the manner now applied, and which, from its recent discovery, could not have existed in the reported cases which have been referred to—that chloroform was successfully used upon this occasion at various times during the operation, the patient being carefully watched, and his pulse felt. Chloroform, gentlemen, has the peculiar property of deadening all sensation of pain during its influence, and hence it must be obvious to you that not only is some length of time used in bringing the patient under its influence, which appears here was considerable, but a more lengthened search might be indulged in, with less fear of injury to the patient, and efforts prolonged rather than leave the stone behind, rendering another of such fearful operations still necessary to be performed at no very distant period, or involving the continuance of that agonizing and irritating pain which has its termination only in death.

And, gentlemen, you cannot fail to have been struck with the remarkable expression of that great man, Cheselden, made use of by Mr. Coulson—one of the greatest operators of his day, and whose name is quoted as one of the highest authorities in lithotomy—who said, that he never went to such an operation “without feeling sick and faint.” Awful consideration! that at such a moment the arm of the operator should be unnerved! I beseech you, gentlemen, when you calmly consider your verdict, to attend to this great man's painful suffering at the moment of proceeding to such a duty, and let me entreat of you, by that verdict, to be so temperate as not to arrest the hand of any future operator in so trying and so awful an occasion. Beware, gentlemen, of unnerving the hand of the operator, and by causing him to tremble at the consequences of such an inquiry as this, and thereby lead him to commit the same fatal error which has unfortunately occurred in this case. No, gentlemen, this is no competent tribunal for discriminating on the niceties of surgical practice. We must all deplore and condemn the rash and inconsiderate act of Mr. Steele in the payment of a sum of money to suppress an inquiry of this nature, and the only palliative which can be suggested, is his anxiety to protect the character both of the hospital and of his client from being assailed—a fatal error in judgment, as the true interests of both would in reality have been better promoted by inviting rather than by erasing an inquiry; for it is by the publicity of all their proceedings that these valuable institutions have acquired so just a title to the confidence and support of the public. This inquiry, though tardy, has had its benefits as well as its evils. It will lead, no doubt, to increased vigilance and caution on the parts of the committee, of the medical and surgical officers, and of the hospital nurses, and to the satisfactory establishment of all the minor departments as well as general arrangement of the hospital.

It would have been melancholy, indeed, if, from the callousness of the human heart from the constant repetition of such awful operations, a recklessness of conduct and a fretfulness and impatience on the part of the nurses and other subordinates should arise; and my blood, I confess, ran cold when I heard of such expressions applied to this child, as “d—d little

devil;” “It would be a good thing when the little wretch was dead;” and on his crying out for drink, to hear the unfeeling expression, “I will jump down your throat, you little wretch, teasing me for drink.” I am sincerely glad to find, gentlemen, as I am sure you must be, that these expressions have been untruly urged against the nurse, Faulkner, from some hostile feeling against her, as well as the inhuman conduct of daubing the child on the bed directly after the operation. These expressions and this conduct have been expressly negatived by Faulkner as ever having been made use of by her, upon her solemn oath; and that testimony has been amply corroborated by respectable patients of the hospital, who were present, and who bear testimony, with Mr. Gay, to her uniform good conduct and kind feeling, and many other testimonials to her general good character have been produced; and I sincerely hope with this powerful corroboration, the balance of the negative on her part will have the ascendancy in your judgment. I trust, however, that the conduct of the nurses, and of the whole of the subordinates of the hospital, when this inquiry is over, will undergo the most searching investigation by the Committee of Governors, who, I have not the slightest doubt, will do their duty in that respect for the general benefit and character of the hospital; and such a consideration in your minds may perhaps, for the reasons I have already mentioned to you, properly influence you to leave the matter in their hands; and unless you feel it a solemn duty devolved upon you to act otherwise, so to leave it. I have no doubt that entire justice will be done by the committee, who consist of thirty gentlemen of great respectability, and that the matter may safely rest in their hands. The nurses are the paid servants of the establishment, whilst, on the other hand, the duties of the surgeons are performed gratuitously, and by men beyond all suspicion as to their general skill, qualification, and ability as regularly-qualified surgical operators, who have passed through the regular courses of clinical and other lectures, have attended the usual courses of practical operations, and are presumed to be, from their education, rank, and standing, when elected to these offices, fit and perfectly competent to discharge their duties in every respect. It is gratifying to find that Mr. Cooke has been attached to this hospital for ten or eleven years, although only recently elected to his present office as one of the head surgeons, from his acknowledged good services during that long period; and I feel assured that you will be slow in pronouncing any harsh sentence against an individual for a single failure in his practice, for all must have a beginning, but that you will take a higher and far more enlightened view of the subject, and set off his general conduct and practice for that very long period against the particular failure in this one lamented instance, which that very able, efficient, and skilful surgeon, operator, and author (Mr. Coulson) has told you *might happen to himself to-morrow*, so difficult is the operation, and particularly in a child, although Mr. Skey, also an able practitioner, takes a different view. You cannot fail, gentlemen, to have been deeply struck by Mr. Cooke's candid avowal of the failure of the operation. Let us charitably hope that it will be a salutary lesson through life, and that this transient error in practice may be the means of his future success and eminence, by using the utmost possible care hereafter.

You will take with you, also, this further consideration, that the whole of this operation was performed in a theatre, before skilful and experienced surgeons, and that although it was off and on for a period of an hour, not a murmur of disapprobation appears to have escaped from the lips of a single person present, or an observation made by any surgeon present that the operation was lasting too long, and ought to be suspended. Time, as it has been observed, slips on, and is scarcely noticed, and under the influence of the chloroform the operation was proceeding without pain or suffering to the child. Had there existed a feeling in the mind of any one present that the operation was being conducted in an unfeeling and reckless manner, and was too much protracted, no doubt some burst of indignation would have been displayed; but, on the contrary, it appears to have passed over without a single murmur, or any attempt whatever made to stop the proceedings.

These establishments, gentlemen, exist, thank God, in every large town in this United Kingdom, and there are very many in this great metropolis, and it is a most gratifying circumstance that, upon the whole, the machinery works well, and many thousands receive their benefit. I can speak most decidedly of the hospitals within my own district of the county. In the London Hospital, where there are the Vice-President of the Royal College of Surgeons and many other surgeons of eminence, I have 150 cases annually of deaths from accidents and other causes, and where operations are almost daily performed.

For heaven's sake let us then, gentlemen, take especial care how we interfere with the practice of such establishments as these. These hospitals are all supported by voluntary contributions. Let me intreat of you to be careful that you shake not their stability by any intemperate verdict, lest you raze to its foundation the establishment which has endeared itself to you, by its many benefits, conferred on your poorer neighbours, amounting, as you have heard, to some 36,000 persons, and thereby also shake to its base the stability of every other similar institution in the United Kingdom, by unnerving the hand of the operator, paralyzing him in his best efforts, and rendering them abortive. At the same time it should be remembered, that public establishments, maintained by the voluntary contributions of the public, should be prepared to undergo a rigid scrutiny, whenever the acts of their officers are called in question.

Gentlemen, as regards your verdict, laying aside, as I think you may with propriety do, any criminal charge, after what has been laid before you by the learned judges in the several criminal cases which have been referred to, you have, in the language of the gentleman (Mr. Curgenven) who made the first *post-mortem* examination, a clear rule to guide you as to the real cause of the death of the deceased. He describes the cause to be "inflammation of the peritonæum after an operation of lithotomy, imperfectly performed," as it is admitted the bladder was not perforated, and it is clearly by misadventure or misfortune, to which he added, speaking of the inflammation, "not at all an uncommon occurrence after lithotomy."

As to the extraneous matter which has occurred since the death of this child, you really need have nothing to do with it in your verdict, which is properly confined to the cause of death alone. No doubt some proceedings will take place upon what has occurred here, whether you recommend them or not; and I shall be enabled, by having impounded the several documents which have been delivered in, to assist in any further investigations of these matters, which I think you may safely trust to other hands.

Gentlemen, you will now consider your verdict, and may retire for that purpose, and if you require any part of the evidence, I shall be happy to assist you.

## THE ROYAL FREE HOSPITAL.

### SPECIAL MEETING OF THE COMMITTEE.

A SPECIAL meeting of the Committee of Governors of the above institution was held on Monday last, in the Board-room of the Hospital, for the purpose of taking into consideration a letter from Mr. Thomas Weedon Cooke, tendering his resignation to the Hospital, and which resignation had been addressed to the weekly board, on Wednesday the 19th inst., upon the termination, and in consequence of, the verdict of the jury at the late inquest.

There was a very full and numerous attendance of the members of the Committee present upon the occasion.

Thomas Beale Browne, Esq., of Montague-square, was unanimously requested to preside during the proceedings.

Letters of a highly satisfactory nature in connexion with the object of the meeting were read by Mr. Fenn, the secretary, from Mr. Fergusson, of King's College Hospital; Dr. Peacock, of St. Thomas's; and also from gentlemen connected with the institution, regretting their inability, from the urgency of prior engagements, to attend the board.

Mr. Weedon Cooke's letter of resignation, which was as follows, was then brought forward and read:—

*"To the Committee of Governors of the Royal Free Hospital.*

"GENTLEMEN,—After the verdict given yesterday, upon the case of the child Alfred Richardson reflecting so injuriously, and I hope I may say unjustly, upon my character as a surgeon, I feel that I have no alternative but to place my resignation in your hands; and, after upwards of ten years' active and anxious service to the poor, pursued not only without reproach until now, but acknowledged, on many occasions, by the Committee and Governors at large, with the warmest expressions of confidence and thanks, I retire from the position you have honoured me with, retaining the sense of affection for the charity which has increased the longer I have had the privilege of serving as one of its officers.

"With the greatest respect for every member of the Committee,

"I remain most faithfully yours,

"T. WEEDON COOKE."

"July 19th, 1864.

After several members of the Committee had expressed themselves in the warmest terms with reference to the attainments of Mr. Cooke, and the efficient manner in which he had discharged his duties during a period of ten years as one of the officers of the hospital, it was resolved unanimously, amongst the most hearty plaudits, "That Mr. Cooke be requested to recall his letter of resignation, and to continue in his office as one of the surgeons of the Hospital."

Some formal business was then transacted, and a vote of thanks having been voted to the Chairman, the proceedings terminated.

## Correspondence.

"Audi alteram partem."

### THE AMENDED VACCINATION ACT.

*To the Editor of THE LANCET,*

SIR,—Some time since, you published a correspondence between Lord Lyttelton and myself relative to the "New Vaccination Act;" permit me to offer the following also, relative to "the amendment" thereon.

As I have been led into an error respecting the *one shilling* fee, the organs of our profession (yourself and other medical journals) are to blame, for I certainly understood from you, by your last week's leader, that under the amendment "any practitioner may vaccinate" for "one shilling a-head," to be paid for by the guardians; and this has, I think, misled many others of our professional brethren. The following letter of Lord Lyttelton's will correct such an erroneous impression.

Now, Sir, unless some grand professional stir is made by general practitioners in this matter, success will not even "loom in the distance" next session. Our friend, John Brady, promised last Tuesday, in committee, before the House, to bring forward next session "a more comprehensive measure" respecting vaccination. Let us assist him in his endeavours during the recess, and hope the result will be an *Act* of benefit to the public and the profession.

In the working of the present Act there is much double-dealing enacted by parish authorities. Whilst, on the one hand, the registrars give the parties registering their printed form, with the names of the parish vaccinators thereon; on the other hand, recommend them to get their children vaccinated at the Government vaccine depôts, their object being doubtless to save the parish the fee. Whether there is any collusion between registrars and guardians is unfathomable. Such a proceeding, to say the least of it, is anomalous, and requires that the working of the system effectually should be invested in other hands.

I am, Sir, your obedient humble servant,

Cambridge-terrace, July, 1864.

W. H. BORHAM.

Cambridge-terrace, Hyde-park, July 17th, 1864.

MY LORD,—The amendment of your Vaccination Act has been so unostentatiously and speedily hurried through the upper House, that the profession had not an opportunity of knowing the amendments you have made, or expressing an opinion thereon.

There is no portion of her Majesty's subjects more anxious to carry out measures affecting the public health than the medical profession, and especially that on vaccination, which owes its origin to a professional brother.

I think, my lord, that every medical man ought to vaccinate those children that he has brought into the world, for many obvious reasons—it would make the object more complete. He can do so by your recent amendment; but the slight remuneration of one shilling will deter many from accepting it, and thus it will rather tend to the dissemination of other diseases *equally or more frightful than the small-pox*. To make this clear to you, I will illustrate it by cases that have fallen under my own observation, and these are legion—viz., many children are born apparently healthy, and seemingly remain so for two or three months, when an eruption breaks out upon the region of the anus, precluded from observation by the apparel, but the face and arms appear quite healthy. The district vaccinator is deceived by the appearances of these children; they are vaccinated, fine pustules are produced, and this vitiated virus is transmitted to scores of others, who shortly after suffer from fulsome eruptions, or the foundation is laid for scrofula or tuberculous consumption. These children have been born of parents who were either suffering from primary or second-

dary syphilis during utero-gestation; and this frightful disease, after the birth of the child, either lies dormant, or slightly shows itself about the third month, the time for vaccination. Such diseases are most likely to be known by the medical attendant of the family, and I humbly submit it as a strong reason for the remunerating fee to be sufficiently large to induce him to vaccinate those he attends, so that such diseases may have less chance of being propagated.

Thanking you, my lord, for the fulfilment of your promise in extending the operation to all qualified surgeons, and hoping that I may not be too late for you to give an increased fee your favourable consideration,

I am, my Lord, your obedient humble servant,  
To Lord Lyttelton. W. H. BORHAM.

10, Great George-street, July 19, 1854.

SIR,—The House of Commons have rejected the proposed fee of 1s., and I must now let the matter alone, having done what I could; but you have misunderstood the object of it. Union surgeons are paid 2s. 6d. and 1s. 6d. for operation, certificate and all. Private practitioners complained that they had to furnish certificates for nothing; I therefore proposed that they should be paid 1s. for the certificate alone, which, compared with the other, seems about in proportion for the operation. Of course they are paid by their employers, unless they choose to do it gratis.

The object was not to throw contracts open to all, which, though I should be glad if it could be done, I did not venture to do, because I found doubts expressed in high authority whether it might not interfere with the due supply of lymph.\*

Your obedient servant,  
To W. H. Borham, Esq. LYTTLTON.

## THE LATE INQUEST.

To the Editor of THE LANCET.

"Use every man after his desert, and who shall 'scape whipping?"  
HAMLET.

"Vis unita forlor."

SIR,—There are few persons who have a higher estimate of the medical profession than I have, and few persons who feel more distressed when its usefulness or dignity is impaired. Its value to the social fabric is too well known to need my eulogy; and, taken as a body, a kinder, more intelligent, or more hard-worked body of gentlemen cannot be found. If united, they could accomplish much; but as they are, they become enfeebled by the want of such power, and fall to the ground, as a bundle of sticks held merely by a thread. This want of union has been long felt as a bad omen for future progress or reform; and the unhappy inquest lately held upon the child who died after an operation for lithotomy, has inflicted one of the most grievous blows that has ever fallen upon the surgical profession.

I shall take no part respecting the squabbles previously at the Royal Free Hospital. I have no acquaintance either with Mr. Gay or Mr. Weedon Cooke, so that my remarks will be general. From my heart I sympathize with the latter surgeon, as he has been made the "Ignatius Polyglot" or scapegoat in this matter, and no doubt feels his position most acutely. Of all the passions of the human mind, vindictive revenge is the most terrible. The commencement of this inquest, its progress, and its climax, are the offspring of that demon! The maw (or man) who first advanced towards this assault upon the whole profession will assuredly find a reward. His bed will be no bed of roses; but if so, the thorns will be amidst them, and perpetually torment him. Had there been no vindictive feeling, the poor child would have been conveyed to its select resting-place without a sound of lamentation. Has there been no failure in this or any other operation before? Is the art of surgery perfect, or man's skill? Have none of the aiders and abettors of this inquest ever committed an error? If they have not, I can only say they are paragons of perfection, and rival the black swan of antiquity. Let them pause in their headlong career; for so surely as the day-beams scatter the clouds of darkness, so surely will this backsliding be kept in the memory of the profession. Heaven knows, the anxiety of the surgeon's life is enough to endure, without his being exposed in the exercise of his duty to the shaft of malice. I would rather be in the position of Mr. Weedon Cooke than in that of other

\* How, if the contract were open to all, it could interfere with the due supply of lymph, I should like the "high authority" to explain. This high authority must have hoodwinked his lordship.—W. H. B.

persons whose names I will not mention. He is a victim, certainly, but let him be of good cheer. He may remember the school-lessons from his "Eton," and this extract, "Nemo mortalium omnibus horis sapit;" and knows, as I do full well, that many unhappy results have ensued from hands high in the annals of surgery, but who had no "d—d good-natured friend" (*School for Scandal*) to give him a tilt over the stile. What Mr. Thomas Wakley had to do with the sequel of the case I cannot understand, or why he was lugged in. If every surgeon who stands by and helps his friend when in a dilemma is to be gibbeted at an inquest, few men will be so forward in future; I for one would not. A few words more, and for the present I shall have said my say. If cruelty had been practised on the child for mere sport; if the operation had not been one of paramount necessity; if Mr. Weedon Cooke had not been one of the surgeons of the Royal Free Hospital,—may I ask whether the strong feelings of philanthropy for the unfortunate patient would have been roused, or consigned with it to the "tomb of all the Capulets"? Will any of the "Tria Juncta in Uno" answer these questions?

Yours faithfully,  
Twickenham, July, 1854. ADELPHOS.

To the Editor of THE LANCET.

SIR,—I consider that the verdict of the coroner's jury in the "Richardson inquest," which accuses Mr. Wakley, jun., of unskilfulness in an operation that he did not perform at all, and actually had nothing to do with, no more than any bystander in the profession who might have been asked by the operator to assist in any way, as is usual,—I consider that verdict so absurd and so infamous, that it is due to Mr. Wakley's reputation that the profession should testify their approval of his conduct, and their abhorrence of such illegal and malicious decisions. I shall be glad to act as one of a committee to carry out so desirable an object.

I remain, Sir, yours obediently,  
J. BERNCASTLE, M.R.C.P.L., &c.  
Albany-street, Regent's-park, July, 1854.

## THE CHARTER-HOUSE.

To the Editor of THE LANCET.

SIR,—The Charity Commissioners are about to sit at the Charter-house to inquire into its management (but with closed doors!)

I beg to point out an imposition practised for the benefit of its solicitor. I was one of about twenty candidates for the appointment of resident medical officer. We each received a note stating we must send a guinea with our application for the solicitor of the Charter-house, who was to lay it before the governors. Is it creditable for such an Institution to allow their paid officer to make such a demand?

I defy them to instance any other Institution whatever, where such a practice is adopted.

I am, your obedient servant,  
M.R.C.S. & L.A.C.

## IMPORTANCE OF UNIFORMITY IN PRESCRIPTIONS.

To the Editor of THE LANCET.

SIR,—A few weeks since, you were kind enough to insert a letter from me on the "fluid pound," in which I mentioned the sad want of uniformity in dispensing, arising from the non-observance of apothecaries' weight. The *Pharmaceutical Journal* of this month contains the same letter, appended to which is an extract from a letter of Mr. James Murdock, of Glasgow, and also a remark from the editor, maintaining that the ʒxvj. avoirdupois is the correct weight for the pound. I think it is but justice to myself that I should reply to the above statement, being, as it is, diametrically opposed to that which I maintained in my letter—namely, ʒxij. as the fluid pound. I must, with all due deference, beg leave to differ from the editor of the *Journal*, and in doing so I am only carrying out the opinion of the majority of chemists, who agree with me, if apothecaries' weight is used in one article, why not in the other? As an instance of this, the following prescription will illustrate the absurdity: "℞ Tinctura arnicæ, aque addantur lb. j." According to the editor's opinion, the pound should be dispensed as ʒxvj. avoirdupois, and the tincture would of course be measured by apothecaries' weight. What is possible to be more inconsistent than this—and it must

appear so in the mind of every man—that in a prescription with only two articles there should be two different weights observed? It certainly ought to convince medical men of the important necessity of discontinuing writing the word “pound,” as it is evident that it admits of a great possibility of mistake. Though the 3xvj. is considered to constitute the fluid pound in dispensing, for which we have the authority of the editor of the *Pharmaceutical Journal*, it would be but only a right inference to draw, that the pharmaceutical chemists all observe that weight: it is not so; there are as many mistakes committed by them as there are by those chemists who cannot boast of being a member.

I trust you will give space for this in your journal. I should not have troubled you, if it were not to show the glaring inconsistency in dispensing, which I think you must agree with me ought to be obviated, and it is only by giving publicity that it can be effectually removed.

I am, Sir, yours, &c.,

AN EXPERIENCED DISPENSER.

July, 1864.

### CHOLERA IN BARBADOES.

THE following fearful details are extracted from the letter of a private correspondent:—

“Barbadoes, 27th June, 1864.

“You have no doubt heard that the cholera has made its appearance in this island, but you have not yet been informed of the awful havoc it has made. It first broke out in Bridgetown, slightly at first, but soon increased in the crowded and filthy lanes of the black population, where it raged most fearfully. It soon increased from ninety to between three and four hundred per diem; and I am informed by Mr. Nicoll, who has the contract for carting the dead to the burial pits, that, up to the present time, upwards of seven thousand have died; but he says that the correct number will never be ascertained, as whole families have been swept off, and in a great many instances several small children have been placed in one large coffin. Up to the 21st, at St. Leonards and the piece of ground purchased by the authorities for the purpose, four thousand two hundred and one were buried. What then must be the whole number, when it is now raging nearly all over the island? I have witnessed a great deal during my residence of nearly fifteen years in the West Indies, but never anticipated such scenes as these. I have only had occasion to go to the town once during the epidemic; the whole place seems panic stricken. Carts, instead of carrying bales of goods, are now employed conveying the dead; in every street you will meet two or three carts, and now and then a hearse, with from six to eight coffins in each. You can get nothing done; people will not work, and the poor are in a state of starvation; there are no provisions to be got, and many die from actual want and neglect, as their own friends, in numerous cases, run and leave them in the agonies of death to die by themselves; and if we do not soon get plenty of rain, I am afraid a famine will succeed the pestilence, as the very cattle seem to be dying for want of fodder. I cannot picture to you one-tenth part of the misery in this at present unfortunate island. It broke out in the garrison on the 31st of last month, amongst the military labourers, with whom it has done its work. As you will see by the statement at the close of this, the number of deaths in the garrison up to last night were two hundred and twenty. I was amongst the first who had an attack. The 36th has suffered greatly, and the 67th, as you will see by the list, and artillery, according to their strength. The artillery are encamped at Gunhill, and the 36th at Brittons; the 67th's encampment is to be pitched at Brittons to-day. We have had an awful time of it with the hospitals, as every article is burnt by general order. If we had not got the stores up from the vacated islands, I do not know what we should have done; the destruction of bedding, &c., has been ruinous. A piece of ground has been measured off at the lower end of the graveyard for a burial-ground where the bedding is burned in pits, from twelve to eighteen per diem. All the lunatics at the Navy Hospital are dead. All Mrs. B——'s old pensioners are gone.

### HOUSE OF LORDS.

TUESDAY, JULY 25TH.

#### MEDICAL GRADUATES (UNIVERSITY OF LONDON) BILL.

LORD MONTEAGLE moved the second reading of this Bill.

The Duke of ARGYLL thought there were great objections to dealing with the Bill as it now stood. He should be sorry to oppose the principle of the Bill, because he felt that the University of London ought to be placed upon the equality originally promised to it with the Universities of Oxford and Cambridge. There was, however, a great controversy amongst the medical profession, as to whether licensing for general practice should be given by licensed bodies, or by the universities alone. This Bill, however, would only settle the question in a partial manner. He thought it would be extremely unfair to grant this privilege to graduates of the London University alone, without extending it at the same time to Scotch and Irish graduates, and it would be much better, on the whole, to limit the Bill to the second clause, which relieved graduates of the London University from the pains and penalties to which they were liable under the Lunacy and Vaccination Acts, and to leave the larger question of medical reform untouched.

LORD CAMPBELL was perfectly ready, for his part, to accept the compromise proposed by the noble duke. The Scotch and Irish graduates had no wish to obtain any advantage over their fellow practitioners, but, at the same time, they objected to being placed in an inferior position.

The Duke of ARGYLL gave notice that, in committee, he should move the insertion of a clause in the Bill to include the graduates of Scotch universities.

LORD BROUGHAM saw no ground whatever for not extending the same privilege to Scotch and Irish universities as was proposed to be given to London. He perceived that Durham was included in the Bill, and though he had no objection to that, he thought the claim of the Scotch and Irish universities were ten times stronger than that of Durham.

The Bill was then read a second time.

### HOUSE OF COMMONS.

TUESDAY, JULY 18TH.

#### VACCINATION ACT AMENDMENT BILL.

SIR J. PAKINGTON moved that the House go into committee on this Bill.

MR. BRADY said that the Bill could not be worked in its present shape and form. So long as the stamp of pauperism remained upon this Bill by associating vaccination with the machinery of the Poor-law Board, there would never be a perfect system of vaccination in this country. There was a Vaccination Board appointed under the Act, but there were no means of securing a full and proper supply of lymph to the large towns and unions. He thought it unnecessary to legislate further on this subject at present, and recommended that the Bill should be more fully considered during the recess. He thought he could promise that when the House again met he should be able to introduce a measure of a more practical and satisfactory character. He moved that the House go into committee on the Bill on that day three months.

SIR J. PAKINGTON said that the Bill had been brought in to correct two errors in the Bill of last session. One was, that a wrong number of days was prescribed, at the end of which the child was to be brought before the medical man for examination; and the other was, that in the Act of last session no sufficient mode of recovering the penalties was enacted. There were also two or three clauses inserted by the request of the Registrar-general. He could not assent to the postponement of the Bill.

The amendment was negatived without a division, and the House went into committee on the Bill.

On clause 1,

MR. HENLEY objected to throwing the expense upon the poor-rates, which was, in fact, creating an additional burden upon land.

MR. BAINES said, that by the Act of 1840, the expenses of vaccination were paid out of the poor-rates, and every subsequent Act had proceeded in the same direction.

MR. HENLEY did not see why, because a wrong principle had been established, it should be persevered in.

MR. BRADY thought it very undesirable that the vaccination stations should be at the workhouses.

LORD SEYMOUR remarked upon the silence of the Government

with regard to this Bill. As the Government did not tell the committee what they thought of the measure or of the working of the Act of last session, it would be better to throw out the first clause. The noble lord moved an amendment accordingly.

Mr. BARROW supported the amendment, inasmuch as he objected to the payment of vaccination out of the poor-rates.

Mr. BAINES felt doubts whether the Legislature had acted wisely in placing public vaccination under the administration of the Poor-law Board. It was found that a mistake had been made in the Act of last session, and that it was necessary that the child should be brought to the medical man on the seventh, and not on the eighth day, and this alteration was one of the principal objects of the Bill. He thought it would be more equitable that the expense of vaccination should be paid out of the poor-rates than out of the consolidated fund, because, if it were defrayed out of the consolidated fund, he did not know what amount of jobbery might not be perpetrated. (Hear.)

Mr. BRADY doubted whether the alteration of the Bill from the eighth to the seventh day was an improvement. He thought that in this climate the eighth was the proper day for bringing the child to the medical man.

Lord BARRINGTON observed that the opinion expressed by the President of the Poor-law Board amounted to a condemnation of the Bill. He recommended the postponement of the measure.

Mr. FITZROY said that, as doubts had been expressed as to the alteration of the day, and after the opinions expressed in favour of the withdrawal of the Bill, he should recommend the right hon. baronet (Sir J. Pakington) to consent to withdraw all the clauses but the second. (Hear, hear.) Next session, the whole matter might be referred to a select committee, who might inquire how the Bill of last session had worked. (Hear.)

Mr. MICHELL knew that the President of the Poor-law Board had received great complaints from various parts of the country that this Bill could not be worked. He doubted whether vaccination was a preventive to the small-pox.

Sir J. PAKINGTON did not feel justified in abandoning the Bill.

Lord SEYMOUR wished to encourage vaccination, and only objected to the mode of carrying it out. In country parishes, where people lived two or three miles from a medical man, it might be the death of the child to compel the mother to carry it to the doctor on the seventh day after vaccination. He should propose that the various clauses of the Bill, with the exception of the second, be struck out.

The clause was then negatived.

Clause 2 was agreed to.

On clause 3,

Sir J. PAKINGTON said that, if this clause were not passed, the committee would reverse the principle of compulsory vaccination which was adopted in the Bill of last session.

Mr. T. DUNCOMBE proposed to insert the words "and fifteenth" after the word "seventh." He knew medical men who would stake their reputation upon the fact that two examinations were necessary after vaccination, and that the examination on the fifteenth day was the more important of the two.

Sir J. PAKINGTON said that the second attendance would impose an unnecessary hardship upon the poor.

The amendment was then negatived.

The remaining clauses of the Bill were put and negatived without a division, and the Bill was reported, with amendments, to the House.

#### SATURDAY, JULY 22ND.

##### MEDICAL GRADUATES' (IRELAND AND SCOTLAND) BILL.

On the motion for the third reading of this Bill,

Mr. E. LOCKHART presented a petition against the further progress of the measure from the Royal College of Surgeons.

Mr. GOULBURN observed, that the Bill had hitherto been proceeded with when but few members were present, and it was now brought on for a third reading without any discussion having taken place upon it. He hoped the third reading would be postponed.

Colonel DUNNE said, the Bill had already received a long and eminently practical discussion.

Mr. E. LOCKHART hoped the suggestion of the hon. member for the University of Cambridge would be acceded to. He, as well as several other hon. members, had left the House when the Bill was brought on, under the impression that it would be referred, with another Bill, to a select committee. He begged to move that the Bill be read a third time that day three months.

Mr. CRAUFURD seconded the amendment.

Lord NAAS said, a Bill had been brought in for extending to the graduates of the University of London the rights enjoyed by the graduates of the Universities of Oxford and Cambridge. It was thought by the House and by the Government that the rights of practice enjoyed by certain bodies should be extended, and that was the sole object of this Bill.

Mr. GOULBURN thought that some general measure ought to be introduced, not having reference to any particular university, but to secure to the public some uniformity of medical qualification. (Hear, hear.)

Lord J. RUSSELL said, it was a matter for consideration whether there were not questions of medical reform which ought to be discussed before the Bill was read a third time and passed. He thought that the Bill ought not to be rejected at once, and he would, therefore, propose that the debate be adjourned till Wednesday.

The House then divided on the motion for the adjournment of the debate:—

Ayes	...	...	...	...	...	82
Noes	...	...	...	...	...	43

Majority for adjourning the debate ... —39

The Burials Beyond the Metropolis Bill was read a third time and passed.

#### MONDAY, JULY 24TH.

##### THE ROYAL FREE HOSPITAL INVESTIGATION.

Mr. PELLATT asked whether the inquest on the body of the child Alfred Richardson was held by orders from the Government, and whether a short-hand writer's notes could be procured, so that the evidence given on that occasion might be printed?

Lord PALMERSTON said the Government had no short-hand writer at the inquest, and therefore could not lay any such notes before the House. He could, however, lay the coroner's notes of the inquest on the table.

##### HIGHWAYS (PUBLIC HEALTH ACT) BILL.

This Bill was read a third time and passed.

##### NUISANCES REMOVAL AND DISEASES PREVENTION ACTS CONSOLIDATION AND AMENDMENT BILL.

Lord PALMERSTON moved the second reading of this Bill, *pro forma*, with the view of introducing some amendments.

Lord SEYMOUR was altogether opposed to this Bill, and recommended that it should not be proceeded with, so that an opportunity might be afforded of bringing in a Bill better suited for the purpose next session.

Mr. HENLEY was also opposed to the Bill.

After a short discussion,

Lord PALMERSTON said he had felt it his duty to proceed with this Bill which had come down from the Lords. He considered that, as there was no doubt cholera had made its appearance, a Bill on this subject should be gone on with; but if the feeling of the House was against the Bill he would not press it on their attention.

The second reading was then negatived without a division.

#### WEDNESDAY, JULY 26TH.

##### MEDICAL GRADUATES (IRELAND AND SCOTLAND) BILL.

Mr. GOULBURN seeing the hon. member who had charge of this bill in his place, asked whether he intended to proceed with it this session.

Colonel DUNNE said he had unfortunately been absent when the order was read, in consequence of which the Bill would be postponed until to-morrow. It was, however, his intention to persevere with it, and he was only waiting to see the result of another measure in the other House.

#### ROYAL PANOPTICON OF SCIENCE AND ART, LEICESTER-SQUARE.

THE directors of this interesting place of amusement well deserve the support and encouragement of the public, for the spirit and energy with which this scientific exhibition has been established. The requirements of the age now demand something more than mere amusement. In 1851, the Crystal Palace gave so grand and unexpected a lesson to the people, as to the real extent and limits of useful art, that the value of such institutions as the present is now justly and properly appreciated.

The founders of the Royal Panopticon have incurred great expense in establishing a school of popular instruction, and of rendering the details of many of the important sciences attractive to the bulk of the public, which, clothed in their technical language are by no means usually so. The education of the middle class of visitors is sufficiently advanced to enable them to comprehend the chief bearings of science when offered to them in a simple form, and more especially when aided by well-conducted and brilliant experiments.

By these institutions most essential service is rendered to the advancement of knowledge. The building itself consists of a splendid circular domed hall or rotunda, around which, at different heights, run two extensive galleries. In these are arranged stalls and compartments, in which are carried on, under the eyes of the visitors, various useful trades and ornamental works, and in one of the galleries is a compartment exhibiting new kinds of "humane" beehives, by means of which the bees are not destroyed when removing their honey.

The floor of the rotunda is occupied by machinery in motion, sculptures, and other works of art and science, which absorb a large amount of study and consideration.

On the side of the rotunda, opposite to the door of entrance, is a plate electrifying apparatus of an enormous size, and furnished with a battery of twenty-four jars of the same dimensions, and from these, when in action, extraordinary effects may be expected.

In the centre of the building is a very powerful and beautiful fountain, about which great taste has been displayed in the application of glass mosaic. During each exhibition this fountain is made to throw a jet of water up to the centre of the dome, a height of ninety-seven feet, which descends again in a finely divided spray, giving, in warm weather, to the atmosphere of the building a refreshing and acceptable coolness.

There is also a magnificent organ which is occasionally made to lend its glorious tones to the attractiveness of the exhibition. Connected with the building also are two lecture rooms, one of them especially arranged for the delivery of class lectures on different subjects. This may be considered as the most important portion of the building, in a scientific point of view, since it is carefully fitted-up for the complete study of chemistry.

The chemical school is open for the reception of pupils, and is placed under the superintendence of Mr. G. F. Ansell. It is supplied with a well-arranged laboratory, and is capable of affording all the necessary instruction in practical chemistry to the student, and of offering a ready mode of obtaining analyses for the public. There are four sessions in the year, and in the month of August the pupils undergo examination for prizes. The hours of attendance are conveniently arranged, and the terms moderate.

We trust that the carrying-out the objects of this institution will continue to be pursued with as much regard to the progress of advancing science as the spirit of the present management seems to indicate, and, with such a guarantee, there can be little doubt that the Royal Panopticon will occupy a forward position amongst the most attractive exhibitions in London.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at the meeting of the Court of Examiners on the 21st inst. :—

BAKER, JAMES BOWYER, Hargrave, Northamptonshire.  
BARNETT, HENRY CALVERT, Peninsular and Oriental Steam-packet Company's Service.  
BIDDLE, THOMAS JAMES, Army.  
CARR, ALEXANDER MACALEEN, Royal Ophthalmic Hospital.  
CURTIS, JAMES, Bristol.  
GARDEN, ARCHIBALD MACDONALD, Hon. East India Company's Service, Bengal.  
HUTCHINSON, THOMAS STEERS, Moore-place, Kennington.  
JONES, EDWIN, Blackfriars-road.  
PEARL, WILLIAM, Hoxne, Suffolk.  
REED, WILLIAM, Newtown-Hamilton, Armagh.  
RYALL, EDWARD CALLY, Australia.  
SKAIFE, JOHN, Easingwold, Yorkshire.  
VITALIS, OTHO FREDERICK, Constantinople.  
WATSON, THOMAS, Bristol.

At the same meeting of the Court, Mr. CHARLES EDWARD STILLMAN passed his examination for naval assistant.

The following gentlemen were admitted Members on the 24th inst. :—

BARRY, THOMAS STOWELL, Cork.  
CLERY, GEORGE CARLTON, Ashton-grove, Cork.  
FOX, JOHN, Weymouth.  
HAWKER, CHARLES, Southsea, Hants.  
ROCHE, THOMAS, Cork.  
SMITH, JOHN GOVETT, Tiverton, Devon.  
VOUT, AUGUSTUS, Yalding, Kent.

At the same meeting of the Court, Mr. JAMES THOMSON passed his examination for naval assistant.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, July 20th, 1854.

MASTERS, MAXWELL TYLDEN, Canterbury.  
MACK, ROBERT, Shadwell.  
SPICKER, NORTHGOTE WILLIAM, Chard, Somerset.  
INCE, JOHN.

**MEDICAL BENEVOLENT COLLEGE.**—We are authorized to state, that the President and Council intend to make another visit of inspection of the College, building at Epsom, on Saturday, the 5th of August next, on which occasion they will be happy to meet any of the friends of the institution who may desire to witness the progress of the works. Gentlemen who may wish to attend should inform the secretary on or before the 1st of August, in order that proper accommodation may be afforded. The Council will leave the London-bridge station for Epsom by the quarter-past two o'clock train.

**TESTIMONIAL TO MR. J. P. GARLICK, OF LEEDS.**—The members of the West Riding Medical Charitable Society have just presented a very splendid testimonial to Mr. J. P. Garlick, their late honorary secretary. The testimonial, which was in the shape of a large silver tray, and a silver tea-kettle and stand, (constructed by Messrs. Smith, Nicholson, and Co., of London,) was previously exhibited in the "Granby" room, at the White Lion; and its exceedingly chaste character excited general commendation. The tray bore the following inscription:—"Presented, on the 13th of July, 1854, to Joseph Prince Garlick, of Leeds, Esq., F.R.C.S., by the members of the Medical Charitable Society for the West Riding of the County of York, in grateful acknowledgment of his services as their honorary secretary for twenty-five years; during which time, by the most unwearied efforts, he largely aided in accomplishing this great object of his active benevolence,—that the institution over whose early years he so faithfully watched should become a permanent blessing to the disabled and necessitous members of his profession, and to their indigent widows and orphans." The attendance of members of the medical profession from various towns, to witness this interesting presentation, was greater than had been expected; and it became necessary, therefore, that the dinner should take place in two rooms, the company meeting for dessert, the speeches, and the presentation in the large room. The testimonial was presented by Mr. Wm. Hey, in a highly complimentary address, Mr. Garlick acknowledging the compliment in a very suitable speech.

**ATMOSPHERIC PHENOMENON.**—A phenomenon of a remarkable kind was experienced on Tuesday at some parts of the city of Bath. During the afternoon, there fell from the clouds a large number of drops, which were at first supposed to be rain, but which, on being examined more closely, were found to consist of a gelatinous substance of about the consistence of thin starch. Upon being submitted to the microscope, the spots were found to be thickly impregnated with eggs, perfect in form, but exceedingly minute in point of size—so minute, indeed, as to be altogether invisible to the naked eye.

**BOMBAY MEDICAL COLLEGE.**—Mr. John Henry Sylvester, one of the students in Human and Comparative Anatomy of the Royal College of Surgeons, who only a few months since was presented by Mr. Plowden with an Assistant-Surgeony in the Hon. East India Company's Service as a reward of merit, has just obtained the following appointments:—Acting Curator of the Museum of the Grand Medical College, Acting Professor of Anatomy and Physiology, and Acting Assistant-Surgeon of the Jamsetjee Jejeebhoy Hospital. This is a rare instance of rapid promotion, but not more so than Mr. Sylvester deserves, a fact which must be very gratifying to Mr. Plowden's discernment in selecting the best students of the various hospitals for his patronage; it is to be wished that the other honourable Directors would imitate the conduct of their esteemed colleague.

**SICKNESS.**—At the last ordinary meeting of the Institute of Actuaries, held at the rooms of the Institute in St. James's-square, John Finlaison, Esq., President, in the chair, a paper was read, entitled, "Observations upon the Sickness and Mortality experienced in Friendly Societies," by Henry Tompkins, Esq. The author commenced by urging the importance of correct data as to the law of sickness. It was more difficult to determine than the law of mortality. Mr. A. G. Finlaison, in his recent Report made by order of the House of Commons, upon the Sickness in Friendly Societies, in which associations nearly three millions of persons were enrolled, had determined the ratio of sickness with a greater approach to accuracy than had ever been accomplished before. Previous investigations have included claims made on account of old age with those of sickness. This had led to erroneous results. Thus at age sixty, every man had been stated to be ill on an average one month in the year; at seventy, two and a half months; at seventy-five, four months; at eighty, five months; and at eighty-five, six months. In consequence of the promulgation of this erroneous data, it was supposed by many that Friendly Societies in general were in an insolvent state. The author proceeded to analyse Mr. Finlaison's Report, from which it appeared that between the ages of twenty and thirty, each person had, on an average, nearly 7 days' illness a year; at 40, it increased to 8 days; at forty-five, to 9; at fifty, to 11½; at fifty-five, to 14; at sixty, to 18½; at sixty-five, to 27½; at 70, to 43½; at seventy-five, to 66, and at 80, to 97½. It was stated that the total amount of the sickness experienced by each person in the 32 years elapsing between 18 and 50, was 260 days; in the 10 years between 50 and 60, 147 days; between 60 and 70, 299; and between 70 and 80, 712. Locality had very little to do with the ratio of sickness. It has also been found that the duration of sickness was in the inverse ratio to susceptibility of attack, as shown in the proportion of persons attacked with sickness. Thus in the northern parts of England nearly 20 per cent. were yearly attacked with illness, while in the midland districts 30 per cent. were so attacked; but, on the other hand, the proportion of sickness to each sick man in the north amounted on the average to 50 days, while in the midland districts it reached only to 36 days: the liability to attack being balanced by the duration, thus making very little difference in the amount of sickness experienced in one part of England when compared with another. With regard to the mortality experienced in Friendly Societies, it was very light, there being at age twenty, only one death in 135; at thirty, one in 130; at 40, one in 97; at fifty, one in 67; at sixty, one in 38; at seventy, one in 18; and at eighty, one in 8. This part of the inquiry coincided with previous investigations almost to repetition. The Report divided labour into two classes—viz., light labour and heavy labour; and each of these again into the two sections—labour in the open air, and labour under shelter; and the results showed a great difference in their ratios of sickness and mortality. The most healthy condition of existence appeared to be "light labour in the open air." The author concluded by enunciating the theory that the duration of sickness was in direct proportion to the vital power. Thus, let  $S_x$  the sickness, be multiplied into the numbers out of which one will die, or intensity  $I_x$ , it should produce a constant number  $C$ . It was stated that tables of payments required in Friendly Societies, calculated from the Report by Mr. Finlaison, were in the press.

**MAIDSTONE INFIRMARY.**—Mr. Thomas Cubitt has given £10 to this institution, as an acknowledgment of the services conferred on a boy while there, and who had been severely injured at the Burham works.

**CHOLERA IN THE MAURITIUS.**—According to despatches per the *Aringo*, cholera has broken out in the Mauritius, attacking the prisons, which were accordingly cleared out, and their inmates removed to the hulks. Port Louis was never less prepared than at present for this dreadful disease, and should it break out there with any violence the effects will be terrific. The number of cases to the 30th of May was 276, and of deaths, 170.

**TESTIMONIALS TO DR. WALKER.**—Dr. John Walker, late of Inverness, now of Birkenhead, has by this time received the last of the testimonials subscribed for by his friends in Inverness and its neighbourhood. The committee to whom the superintendence of the presentation was remitted, ordered, through their convener, the provost, a very handsome brougham, which has been presented to Dr. Walker. The carriage was made by Messrs. Macnee and Russell, of Edinburgh, and is of the best workmanship. On a silver plate inside, the following suitable inscription has been engraved:—"Presented to John Walker, Esq., M.D., by a number of his friends and well-

wishers in Inverness and its vicinity, as a tribute of personal esteem and regard, and in testimony of their high respect for his professional character. 1854."

**MELBOURNE UNIVERSITY.**—Professor M'Coy, of the Queen's College, Belfast, has been unanimously selected by Sir J. T. W. Herschell, Professor Airey, (the Astronomer Royal,) and other members of the Melbourne Professorship Committee, to fill the Chair of Natural Sciences in this university. The stipend is £1000 a year, with a house, and allowances for travelling expenses, &c. Professor M'Coy is nephew of the late Frederick William Conway.

**POISONED SWEETMEATS.**—On Tuesday, Mr. Baker held an inquest in Bethnal-green, on a girl, aged eighteen, who had been in the habit of eating sweetmeats, and who died on Sunday from mortification of the stomach, produced, according to the medical evidence, by the poisonous ingredients used in colouring the sweets of which the deceased had partaken.

**THE EMIGRANT CHOLERA PATIENTS.**—The cholera is rapidly disappearing from the ship *Dirigo*, through the promptness and activity of Government and the medical officials; there are only eighteen in the convalescent ward, five in the union hospital, and two in the depot hospital, all of whom are progressing well. It is also satisfactory to learn that not a case has occurred in the township of Birkenhead. The commissioners of the town have communicated with the Home Secretary, and the commissioners of emigration, London, urging the necessity of making adequate provision to meet any sudden outburst of cholera that might take place.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, JULY 22.**—In the week that ended last Saturday the total number of deaths registered in London was 1006, nearly the same as in the previous week. In the ten corresponding weeks of the years 1844-53 the average number was 1016, which, with a correction for increase of population, gives 1118. Last week's return, in which the deaths are more than a hundred less than the estimated amount, shows a favourable state of the public health at a time when it is threatened with a renewal of the cholera epidemic. The deaths returned last week as caused by zymotic diseases were 293, whilst the corrected average is 342; they show an advance on the previous week. Small-pox carried off 12 children, and 4 persons of twenty years and upwards, whilst scarlatina has increased its weekly proportion of fatal cases to 80. The latter disease has visited some families with severity, and in the present returns an instance is recorded in which three children died of it in the same family within six days. Diarrhoea has increased, and cholera has suddenly sprung into activity; the deaths from the former rose in the last two weeks from 46 to 53; those by cholera from 5 to 26. The Eastern Districts, especially Limehouse, are the chief field of its earliest operations.

## Obituary.

ON July 6th, at 1, Warwick-street, Charing-cross, of paralysis, ALEXANDER THOM, Esq., first-class staff surgeon, formerly of the 11th and 86th Regiments, and late principal medical officer at the Mauritius. By the death of Staff-surgeon Thom, the British army has been deprived of one of the most talented, energetic, and efficient officers of its medical service, to which he was an ornament, and at a time, too, when his great practical experience of the diseases of military life in foreign climates, and his acknowledged superiority as a superintending and directing medical officer, might have become available for economising the valuable lives of our officers and soldiers now serving on the banks of the Danube. The merit and services of Mr. Thom were well known to, and fully appreciated by, the present chief of the Army Medical Board, under whom he had served two years at Chatham, before he exchanged with the surgeon of the 86th Regiment, then in Scinde. Dr. Smith's ever-ready forwardness to advance Mr. Thom's prospects in the service, and his kind attention to him during his last moments, are gratifying proofs of how richly deserving of public reward he considered him. Having been selected by his chief for the important and onerous task of bringing up arrears of public medical business at the Mauritius, though labouring under indifferent health at the time, he did not shrink from the duty which had been assigned him. Leaving Bombay, where, for some time after the death of Dr. Kinnis, he had been acting as Deputy-Inspector of Hospitals, he assumed the office of principal medical officer at the Mauritius, on the 19th April, 1852. The estimation in which

his services, military and civil, were held by the authorities of this settlement, was evidenced by the complimentary Governmental order issued on his departure for England, and by the address from the Meteorological Society of the island, requesting him to accept the office of honorary president, with a vote that his portrait should be hung in the rooms of the Society. Apart from his duties there as principal medical officer to the troops, were those appertaining to his office of chief medical adviser to the Government, and between these his labours were so greatly increased that he felt a sacrifice, it is feared, to his keen sense of public duty and his untiring energy. Mr. Thom served with distinction in Portugal, the Ionian Islands, and in India. Next to his professional studies, the subject of meteorology was his favourite pursuit. His well-known work, "On Storms," was published in London in 1846, at the pressing request of Captain Beecher, assistant-hydrographer to the Admiralty, and of Captain Stokes, who had just returned from a survey of the Eastern seas. Its publication led to many gratifying testimonials from the scientific men of the day, with many of whom afterwards the author kept up a friendly correspondence. His excellent report on "Cholera," as it affected all the troops at Kurrachee, but more particularly the men of H. M. 86th Regiment, during June, 1846, was published by order of the House of Commons, in March, 1848. The dreadful mortality of this epidemic, which in a few days destroyed 700 fighting men and several thousand civilians, deeply impressed the profession and the public; and the report which embraces its history has been acknowledged to be a masterly production. Mr. Thom's career is a proof of how much talented individuals may, by persevering industry, accomplish for the honour of their profession, and for the benefit of their fellow-creatures; and to all desirous of attaining the same honourable distinction we would say, "Go and do likewise."

On the 21st inst., at Duke-street, St. James's, in his 69th year, John CALLANDER, Esq., late surgeon of the 7th Hussars. At Clapham-rise, Mr. FREDERICK CLIFFORD CHERRY, aged 74, principal veterinary surgeon to the army. At Exeter, Mr. JOHN FERGUSON BACON, late surgeon on the Bengal Medical Establishment.

## The BRITISH MEDICAL DIRECTORY for 1855.

It is particularly requested that the "returns" or "entries" for this Work may be forwarded as early as possible.

### TO CORRESPONDENTS.

*Chirurgus.*—The conduct of Mr. Home Popham throughout was most honourable. His evidence was clear, and evidently that of a man actuated by generous sentiments. To mark his sense of the traucers of Mr. Cooke, he placed a patient suffering from strangulated hernia under the care of that gentleman within a week after the occurrence of the operation for lithotomy.

*Aquarius.*—Pure spring water does not contain animalcules, the presence of which in any kind of water is a certain evidence of impurity. Thames water, as might be supposed, swarms with microscopic animalcules.

*M.D. Edin.* will perceive that the committee of the Royal Free Hospital have not accepted Mr. Cooke's resignation. It "is an example worthy of imitation."

*M.R.C.S.L. and L.A.C.*—However the levity of the judge may be condemned, we fear that the law was against our correspondent. It is only another instance of the gross injustice to which medical practitioners are exposed by the present state of the laws which regulate the profession.

*H.E.*—The bill of Messrs. Goulden and Sons is certainly a contemptible production.

*L.H.*—The extract of Indian-hemp is used as a sedative, in doses of three to five grains.

*A.B.*—Cases of the kind are not uncommon.

*L.F.*—The Apothecaries' Act does not interfere with the trade of the chemist and druggist.

*The Royal Maternity Charity.*—We will endeavour to find room for Mr. Sparkbrook's communication in our next.

*An Anxious Inquirer.*—At present we do not know what arrangements have been made. The information might be obtained by applying to the secretary at the hospital.

*Bur.*—It is not probable that the alteration will be made during the present session of Parliament.

*A City Man.*—It is doubtful whether any good would result from publishing the correspondence.

In conclusion of Dr. Henry Bennet's valuable paper, "On the Use and Abuse of Potassa Fusa and Potassa cum Calce in the Treatment of Uterine Disease" is unavoidably postponed.

The correspondence that has been addressed to us, relative to the proposed meeting at the Freemasons' Tavern, will be forwarded to the chairman. The hour will be changed from eight to three.

*Mr. W. E. Beaumont, (Toronto).*—It will scarcely be necessary, as we publish Mr. Beaumont's lecture entire, to insert his letter in THE LANCET. Our attention has been directed to the subject of which it treats by the perusal of some articles in the *Upper Canada Medical Journal*, referring to the matter. We trust that the misunderstanding may be amicably settled.

*A. B. C., (Norwich).*—Full information has reached us on the subject, which shall receive early attention.

*A Student.*—The double qualification is necessary. Those instances in which the surgeon possesses only one qualification are quite exceptional cases.

*A Friend.*—Under existing circumstances, it is desirable not to open the controversy.

*Pater Familias.*—Full information will be found on all the points enumerated in the next Students' Number of THE LANCET. That number will be published before the commencement of the next winter session, and in sufficient time to make all necessary arrangements.

### REPORTED EXEMPTION OF MEMBERS OF THE JEWISH PERSUASION FROM ATTACKS OF CHOLERA.

To the Editor of THE LANCET.

SIR,—In your journal of last week, in the "Notices to Correspondents," I find the following on the above subject:—

"Mr. G. L. Spencer.—Several letters and other articles appeared in this and other journals respecting the subject. It was suggested by one correspondent that the Jews were exempt from cholera, in consequence of eating much olive oil. Other correspondents were of the same opinion; but others again attributed the exemption to other causes, one of which was the care which the Hebrews exercise in their diet, avoiding shell-fish and other articles likely to produce diarrhoea."

In the paper I had the honour to read before the Epidemiological Society on the 3rd of July, "On the Use of Vegetable and Mineral Acids," &c., an abstract of which appeared in THE LANCET of July 15th, having spoken of the use made of vinegar with articles of diet by the ancient Jews, I remarked:—

"Perhaps it will be found upon further inquiry that the members of the Jewish persuasion of the present day are somewhat indebted to the use made of vinegar and lemon-juice, as well as to olive-oil, for their reported exemption from attacks of cholera. I possess a statement of the use made of both of these vegetable acids with articles of diet, which serve to throw some light on this subject. The merit hitherto, as far as I know, has been given to olive-oil, abstinence from spirituous liquors, as well as to the precautions taken with respect to animal food before cooked, and to the rigid observance paid to the cleanliness of all cooking utensils."

Many medical men will have opportunities of inquiring of their Hebrew patients as to the use made of vinegar and lemon-juice by that sect; and should they hereafter find them exempt from the malady which may afflict others, it is hoped that, for the sake of science, and the benefit of the whole human race, they will impart their opinions of exemption to those whose desire it is to promulgate facts.—I am, Sir, your obedient servant,  
Berners-street, July, 1854. J. H. TUCKER.

*A Patient.*—There is no difficulty in procuring admission. Any governor of the hospital would, under the circumstances, give a recommendatory letter.

*J. C.*—Unless a special contract was made, the principal is not liable. If such contract could be proved, there is no doubt that the whole charge would be recovered. There have been several similar cases before the courts.

*A CORRESPONDENT*, signing himself *Veritas*, has addressed a letter to us relative to the abuses at the Royal Infirmary, Manchester. The composition is so defective, that the letter is inadmissible. The object of *Veritas* is to prove that no abuses exist in the infirmary, and that the assertions contained in a letter that was published last week are untrue.

*F. H.*—The case has not sufficient interest for insertion.

*M.B.*—The Bill was read a second time in the House of Lords on Tuesday last. *A Subscriber to THE LANCET.*—The words of the Act indicate clearly that the certificate of either the London or Edinburgh College is essential.

*A Surgeon, (Nottingham).*—Such a disreputable document deserves publicity:—

"Important to the Public!—Advice Gratis.—Mr. Day, Surgeon and Accoucher, Licentiate of the Faculty of Physicians and Surgeons, may be consulted daily at his residence, W. J. Day's, dispensing chemist and druggist, opposite the Review-office, Bridlesmith-gate, Nottingham."

Generally, that in consequence of his brother's residence with him they will secure what is so much needed in Nottingham, (especially for the benefit of the poor), a qualified opinion in all cases of sickness and disease, free of charge, and medicines prescribed dispensed at the usual druggists' prices.

"Mark the address.—W. J. Day, dispensing chemist and druggist, opposite the Review-office, Bridlesmith-gate, Nottingham."

*The Case of Captain Childs.*—We propose to offer some observations on the important case of Captain Childs in our next number.

*ERRATUM.*—In the Notices to Correspondents of last week, for Mr. Hardy read Mr. Harley.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. W. Liloy, (Sparkbrook); Mr. J. Eaton, (with enclosure); Mr. E. P. Mingay, (Dedham, with enclosure); Mr. F. Merry, (Shottesham, with enclosure); Mr. E. Locke, (East Dereham); Mr. B. Dawson, (Montreal); L. H.; Mr. T. Pearce, (Plymouth); Aquarius; Mr. W. L. Dickenson, (Wokington); Mr. T. Baker; An Indignant Member of the Profession; Mr. Wilkinson, (Sydenham, Kent); Parental Endowment Assurance Company; Adolphos; The Secretary of the Medical Benevolent College; Dr. O'Connor; *Veritas*; F. H.; M.B.; M.D. Edin.; M.R.C.S.L. and L.A.C.; H. E.; A Surgeon, (Nottingham); A. B.; L. F.; Buris; An Anxious Inquirer; Mr. W. R. Beaumont, (Toronto); A. B. C., (Norwich); A Student; A Friend; Pater Familias; A City Man; Mr. J. Tucker; A Patient; J. C.; A Subscriber to THE LANCET; Mr. M. Lockhart; Guido; An Observer; Mr. Harley, (Stockport Infirmary); Mr. Maxwell; &c. &c.

## Sir William Burnett's Disinfecting

FLUID.—This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious and low-priced imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.

FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pint, at 6d.; and in larger vessels, at 6s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipissated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipissation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

IMPORTANT TO THE MEDICAL PROFESSION.

## Davenport's Syrup of the Iodide of QUININE AND IRON.

FROM DR. GOLDING BIRD.

"49, Russell-square.

"I have now for some time employed pretty largely the triple Compound of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the form of Syrup. I do not hesitate to express my opinion of its great value as a therapeutic agent. It has appeared to me that the Quinine assisted the assimilation of the Iron, and I have found it to be of very great value in cases in which the use of the Iodide of Iron is recognised. This triple Compound possesses many advantages over the simple Iodide, and not the least of them is the satisfactory manner in which it is tolerated by the stomach, especially if administered (as all preparations of Iron ought to be) immediately after a meal.

"GOLDING BIRD, A.M., M.D., F.R.S.

"Fellow of the Royal College of Physicians,

"Physician and Professor of Materia Medica, at Guy's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with confidence testify to its marked efficacy in cases of Struma and Anemia, and, indeed, in all instances in which the exhibition of Iron and its Compound is indicated. This preparation appears to combine all the therapeutic powers of its constituents, without their nauseous qualities, which renders it an admirable medicine in the treatment of some of the disorders of Childhood.

"Maldon.

"Geo. P. May, M.D."

SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Insipissation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 25 per cent. of Quinine. 4s. 6d. per oz.

SYRUP OF THE IODIDE OF IRON (P.L.), 3s. per lb.

BI-MECONITE SOLUTION OF OPIUM. Professional testimonials acknowledge this preparation to be the most efficient sedative extant. The unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30 Drops. 8d. per oz.

COTYLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and 1s. per oz. also the Preserved Juice, 5s. 4d. per lb., as recommended by Mr. Salter, (of Poole,) in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, GREAT RUSSELL-STREET, BLOOMSBURY.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## JOZEAU'S COPAHINE MÈGE.

Or SACCHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 9d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice.—J. C. W. LEVER, M.D., Physician Accoucheur, Guy's Hospital, Mr. FRAUVESSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green; London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttae P.L., easily applied and removed, and will not produce stranguity or troublesome after-sore. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London. "Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Stranguity.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 49, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignees, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Hooper's Waterproof Sheeting, for protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

Mr. Hooper has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

HOOPER, Pall Mall East, and Grosvenor-street, London.

## Purification of Linen—Prevention of

Disease.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

Sir,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boilessve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy; I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boilessve, Esq.

J. PALFREMAN, House Steward.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Highfield, Berkhamstead, Herts., January 24th, 1854.

Sir,—I read some time ago in your valuable paper, an article advocating the need in this climate of warming dwellings with some simple apparatus, giving ventilation, combined with the healthiest temperature, at a great saving of fuel. I am very glad to give you the result of my experience of a new kind of stove, named "Calorifere," erected some months ago at this residence by Mr. J. Boilessve, London; it answers its purpose perfectly; the house and every room to which the ventilation is adapted, is kept at an agreeable temperature, with an utter absence of the oppressive atmosphere usually experienced by all other methods of warming dwellings; that I have seen several persons, some of them highly scientific, who have examined the apparatus and have expressed themselves satisfied, and consider it a most perfect application of warm air and ventilation combined. The cost of warming the house and conservatory attached, has been *Eightpence per twenty-four hours*, during the late cold weather, and the trouble of attendance is very little. The economy of fuel will cause this stove to be generally adopted. I have no doubt, more especially as the charge for coals is constantly on the increase. The stove in operation should be seen to be appreciated, and I can add, from my experience of its effects during this winter, that it is invaluable for any invalid in so variable a climate as ours, and no one can be aware of the comfort until it is tried.

I am, Sir, yours obediently, a Subscriber,

The Editor of the Times.

E. W. FERRIS.

## India-rubber Urinals for Male and FEMALE RAILWAY TRAVELLERS AND INVALIDS.

No. 1.

No. 2.

URINAL FOR BED USE.  
Price 15s., 18s., and 21s.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

## Mr. T. H. Wakley's Stricture Instruments.

Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## New Urethrotome, by Mr. Ure,

Surgeon of St. Mary's Hospital, described in THE LANCET of June 10th. —Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London. —JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## Darby and Gosden beg to call

the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.

140, LEADENHALL-STREET, CITY.

## ELECTRICITY

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis or by post for Two Stamps) contains the names of more than 800 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 6s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of CHOLERA the continuous current from the colon to the liver has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.) 103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.) Prospectus gratis, or by post for two stamps.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

FIG. 1. BELT AND AIR-PAD FOR PROLAPSUS UTERI OR ANI.—Mr. Bourjeaud begs to state that the apparatus here figured has been found extremely useful in cases of prolapsus uteri or ani, and with patients, especially females, who require support for the perineum. The compressing agent is a caoutchouc bag, filled with air; it is in the diagram hanging loose in front of the patient, and is fixed in its place by the strips of elastic tissue, the free extremity of which is seen. The latter is fixed to the lower and posterior margin of the belt, and by the elasticity of the bag and straps sufficient compression is made, and not the slightest uneasiness is experienced. This is a most valuable adjunct to surgical and obstetrical practice, and is highly appreciated by the most eminent members of the profession.

FIG. 2. This is a most useful belt, called the ABDOMINAL SUPPORTER. It is made of varying strength, to suit the peculiarities of patients, and is most useful during gestation or after parturition, to forestall the uncomfortable state called pendulous abdomen. During gestation, it relieves the veins from the pressure of the distended womb, and thus prevents swelling of the legs; and after the birth of the child it is most valuable to those ladies who are anxious for the look of their waists. This belt is most useful in cases of dropsy, especially when ovarian, as the pressure may be increased so as to conduce, in favourable cases, to the absorption of the fluid. Mr. Bourjeaud cannot too strongly recommend this belt to corpulent people: they will find it a real comfort.

## Caution!—Messrs. Allsopp and Sons

find it necessary to caution the Public, and especially Shippers of their Ales to the Colonies, against frauds committed by parties in selling spurious Ales for those of Messrs. ALLSOPP & SONS.

Messrs. ALLSOPP & SONS have felt compelled, by the extent to which this disgraceful practice has been carried, to proceed, in several cases, by obtaining Injunctions from the Court of Chancery; and have ultimately been driven to prosecute criminally, for the commission of this offence. They beg to call attention to the case of "THE QUEEN v. GRAY & GOSLIN," in which Lord Campbell sentenced the parties charged to TWELVE MONTHS IMPRISONMENT WITH HARD LABOUR.—*See Times and Morning Advertiser of the 18th May.*

Messrs. ALLSOPP & SONS will thank all persons having reason to doubt the genuineness of any article sold under their name, to send them the earliest information, in order that immediate steps may be taken for prosecuting the parties.

Messrs. ALLSOPP & SONS will be happy to furnish the names of respectable houses, where a supply of their Ales may be depended on, as genuine from the Brewery.

Brewery, Burton-on-Trent.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## Malt Tax—addition of 50 per cent.

BASS'S EAST INDIA PALE ALE.

BERRY BROS. & CO. take the liberty of announcing that they have now on hand, in Cask and Bottle, an ample supply of BASS'S PALE ALE, with all its accustomed beauty of flavour and delicacy of colour, and WITHOUT ANY ADVANCE IN PRICE.

3, St. James's-street, London.

## Baron Liebig on Allsopp's Pale Ale.

"I am myself an admirer of this beverage, and my own experience enables me to recommend it, in accordance with the opinion of the most eminent English physicians, as a very agreeable and efficient tonic, and as a general beverage, both for the invalid and the robust."—*Glossen, May 6.*

ALLSOPP'S PALE ALE ONLY IS BOTTLED BY PARKER & TWINING, Beer Merchants, 54, PALM-MALL.

IMPERIAL MEASURE.—Quarts, 8s.; Pints, 5s.; Half-pints, (for luncheon,) 3s. per dozen. Also in Casks of 18 gallons and upwards.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1853, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BOTTLED PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

## George Hanson's Sparkling Hop

CHAMPAGNE, Quarts 18s., Pints, 12s., Sparkling Nectar, 8s., bottles included; Hampers, 1s.

This new and exhilarating beverage, possessing the fine aroma and pure tonic properties of the Hop, with all the brilliancy of the foreign Champagne, stands unrivalled as a luncheon and dinner luxury. To Invalids it is invaluable, and can be taken without affecting the head—its habitual use assisting the digestion.

To Merchants and Captains it will be found an excellent article for Export—to Passengers in sea-sickness this restorative will be highly appreciated—it will be found a cool and refreshing drink at the Mess Table—and in Warm Climates most desirable.

G. H. has the greatest confidence in recommending the above, and the demand, which its excellence has created, is sufficient guarantee of its quality.

May be had at most of the Taverns and Refreshment Rooms in the neighbourhood of the Crystal Palace.

Sold Wholesale, Retail, and for Exportation, by the Manufacturer, GEORGE HANSON, 39, Clement's-lane, Lombard-street, City.

## Tobacco Smoking.—Tobacco Smoke

contains two very powerful poisons, which, when absorbed by the system, as in ordinary smoking, produce many serious diseases destructive of the physical and mental health of the smoker.

PHILLIPS and CO.'S Patent Condensing and Filtering Pipes and Stems for Meerschaums are the only inventions known that permit of healthful smoking, and which the medical profession will find worthy of their notice as a valuable therapeutic agent in all cases where the smoking of tobacco and stramonium may be desirable.

Read the Smoker's Friend, or the Philosophy of Smoking, which may be had gratis of all Phillips and Co.'s agents, and also of the Patentees and Manufacturers, 9, Lyon-street, Caledonian-road, Islington, London, who will send them post free to all applicants.

A Pipe or Stem sent post free, price 2s. each, or two for 3s. 6d.

## Metcalf and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 n and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMCEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Cocoa of the finest quality, prepared

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 8d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Soucheong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the Kingdom. Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London. Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Do you bruise your Oats yet?—New

Oat-crushers, £3 15s., £4 5s.; Chaff-cutters, £1 7s., £3 7s.; Mangles £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 2s. a Week; or a Book on Feeding, 1s. 4d.

## Rice Harris and Son, Islington

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroys the effluvia and smoke, which have hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham, and at Mr. JOHN SHORTER'S, Crispin-street, Spitalfields, London.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS,

## Important Saving, by Pre-payment,

in the PURCHASE of NEW WHITE MOULDED VIALS. APSELY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., & 1 1/2 oz. per Gross, 6s.	
3 oz. " " 7s.	
3 oz. " " 8s.	
4 oz. " " 10s.	
6 oz. " " 15s.	
8 oz. " " 18s.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

4 1/2 oz. graduated in 3 doses 12s. 6d. The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSELY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**Assistant.—A Licentiate of the Hall,**  
married, aged twenty-five, is in want of a Situation as Out-door ASSISTANT. He is accustomed to Union and Club Practices. Good references given.—Address, stating salary, to C. L., Post-office, East Duesham, Norfolk.

**A married gentleman, of active**  
habits and experience, both in town and country, wishes for a PARTNERSHIP with an elderly or invalid Practitioner.—Address, L.S.A. care of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street.

**Medical Assistant wanted by a**  
Surgeon in the country. One qualification required. Salary £40 per annum, with other privileges.—Address to T. T. W., care of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street, with two references

MEDICAL.

**The Advertiser, who has served three**  
years of his apprenticeship with a Surgeon in the country, wishes for a Situation with a Medical Man in London, to whom his indentures can be transferred.—Address, Messrs. Gale, Baker, Warde, and Oldfield, Wholesale Druggists, Bouverie-street, Fleet-street.

TO THE MEDICAL PROFESSION.

**To be Disposed of, a good Practice,**  
on very advantageous terms, in a populous village and neighbourhood in the county of Lincoln. To a qualified and industrious gentleman this offers a rare opportunity.—For particulars apply to P. O., at Mr. Smedley's, Bookseller, Sleaford.

**Wanted, by a Surgeon in the country,**  
a duly-qualified ASSISTANT, to Visit and Dispense. It is requisite that he should have a thorough practical knowledge of his profession. One having a knowledge of the Welsh language would be preferred.—Address, stating age, reference, and salary required, to D. Davies, Esq., Brynagolwg, Aberdare.

**King's College, University, or**  
MIDDLESEX HOSPITALS.—An M.D. London, Associate of King's College, and L.A.C., residing near Cavendish-square, and attached to a Public Dispensary, wishes to receive a PUPIL, with nominal Apprenticeship if required.—Address, M.D., care of Mr. Reed, 15, John-street, Regent-circus.—References to former pupils.

**Wanted, an Assistant, with at least**  
one qualification, to take charge of a small Branch Practice in a large town. The situation would be permanent. Salary, £80 per annum, with one-fourth of the Midwifery fees, for the first year; afterwards, an additional percentage on the receipts.—Address, Medicine, Messrs. Butterfield and Clarke, York.

MEDICAL.

**Wanted, by a young gentleman,**  
(L.R.C.S.E.), a Situation as ASSISTANT to a General Practitioner in England, where every opportunity would be afforded him of gaining a practical knowledge of his profession. Salary not so much an object. Satisfactory references can be given.—Apply to T. W., Coldstream, Berwickshire.

**Medical Partnership Wanted in a**  
large town in the north of England, where the present proprietor is still active, but wishes to relieve himself of a portion of his more arduous duties. The Advertiser is twenty-five years of age, and possesses a double qualification.—Address, stating terms, &c., to Alpha, Box 1, Post-office, Wakefield.—None but principals need apply.

**A gentleman, aged 19, son of a**  
clergyman of the Established Church, wishes to obtain a Situation (in Birmingham or its immediate neighbourhood) as ASSISTANT to a Surgeon, where, in return for his services, he would be permitted to pursue his Hospital Studies, and afforded a comfortable home, with gentlemanly treatment.—Address, T. M. D., care of Mrs. Bogle, Stationer, Dudley.

**The Friends of a Lady, for whom a**  
change from home is desired, wish to place her in the family of a Medical Man, residing within an easily accessible distance of London, where she may obtain kind and careful attention, with cheerful society.—Address, with full particulars, terms expected, &c., to Dr. Lever, Wellington-street, London-bridge.

TO SURGEONS AND APOTHECARIES.

**To be Disposed of, the Stock, Fixtures,**  
Goodwill, and Lease of a SHOP and DWELLING-HOUSE, situate in one of the most public thoroughfares in Manchester. The business has been conducted for the last eight years by a respectable surgeon, who is declining it solely in consequence of increased professional engagements. Sum required, about £600.—Apply to Messieurs Deloitte and Halliday, Accountants, 29, Dickinson-street, Manchester.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RETIRE, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Assistant.—A gentleman, fully**  
qualified, aged thirty-five, of much experience, wishes for a Situation, or to act in the absence of the principal. Satisfactory references given.—Address, L. R., THE LANCET Office.

**Mutual Advantage.—A General**  
Practitioner in London is desirous of EXCHANGING his PRACTICE for that of a gentleman practising in the Country.—For further particulars, address H. B., THE LANCET Office, Strand, London.

TO SURGEONS.

**In Sussex, an increasing and respect-**  
able PRACTICE, receipts exceeding £200 per annum, for Transfer, Terms £100, with introduction.—Apply to Mr. Jacobson, No. 33, Walbrook, City.

TO SURGEONS, &c.

**A desirable Practice and Retail,**  
situate in a most eligible position at the West-end, for immediate Transfer. Purchase £800.—Apply to Mr. Jacobson, Walbrook Chambers 33, Walbrook, near the Mansion-house.

**Wanted, by a General Practitioner**  
in the country, a gentleman, not under thirty years of age, to take charge of his Practice for a short time during his absence. Any gentleman wishing to get out of town for a week or two would find this an agreeable change.—N.B. One accustomed to Union and Club Practice preferred.—There is no horseback.—Address, Mr. F. W. Merry, Surgeon, Shottesham, All Saints, near Norwich, Norfolk.

**Exchange of Sons.—A Surgeon,**  
residing near Leeds, wishes to place his Son, aged twelve, in a family residing in London, to attend the School of University College; and would receive the Son or Daughter of a gentleman for the same period, who, from any cause, requires country air and medical care. The highest London references given and required.—Address M. D., 65, Camp-road, Leeds, Yorkshire.

**General Practice to be Disposed of,**  
between thirty and forty years established, in a highly respectable and populous neighbourhood in the county of Suffolk, with Union Appointments, Clubs, &c. Receipts about £500 per annum. The house and premises might be taken at a valuation, and part of the money remain on security if required. A three or four months' introduction would be given.—Address, F. G., No. 1, Norton Folgate, London.

TO PARENTS AND GUARDIANS.

**A Dentist is desirous of a Pupil,**  
a gentlemanly and well-connected youth, of a mechanical turn of mind. He would be treated as a member of an intelligent and well-conducted family circle. The highest references would be given. A premium proportionate to the professional advantages, and the domestic comforts offered, would be expected. For an interview, address to P. P., care of Mr. Calder, 190, Oxford-street.

**Medical Practice.—To be Disposed**  
of, the PRACTICE of a Surgeon in Wolverhampton, with the Surgery Fixtures, Instruments, and other effects. Also, the Furniture of a comfortable Dwelling-house adjoining to the Surgery, and suitable for the residence of a respectable family. The Practice has been established upwards of twelve years, and is a good general one. The whole may be taken to at a fair valuation. The present is an opportunity rarely to be met with for an active member of the profession to become possessed of a Practice already acquired, and capable of being considerably extended.—Address, I. B., Post-office, Wolverhampton.

TO SURGEONS AND CHEMISTS.

**For immediate Disposal, a respect-**  
able Chemist and Druggist's Double-fronted Corner SHOP, handsomely fitted up, and commanding situated (unopposed) in the heart of an extensive, populous, and growing neighbourhood on the northern verge of town, ensuring to a Druggist very satisfactory results, and to a Surgeon the rapid establishment of a valuable Practice. Private entrance, and every requisite for the residence of a genteel family.—Apply to Mr. Orpwood, Auctioneer, &c., Artillery-place, Finsbury-square.

Printed by THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CURVEHILL, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and Newsvendors in Great Britain and Ireland and the Colonies.—Saturday, July 29, 1864.

of the week, a list of Patents, with abstracts of Specifications, a Domestic  
Miscellany, and Correspondence; 32 pages, 8vo.  
Office, 49, King William-street (City), London.  
Order of all Booksellers and News-vendors in the Kingdom.

Just published, price 6s., illustrated with numerous Engravings  
on Wood.

**The Eye in Health and Disease.**  
With a description of the Optometer, for the adaptation of Spectacles,  
for Impaired, Defective, or Aged Sight. Being the substance of Lectures  
delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE,  
F.R.S., Surgeon to the Bank of England, Surgeon to the Central London  
Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on  
the Stereoscope and Binocular Perspective.  
Longman and Co., Paternoster-row; Horne, Thornthwaite, and Wood,  
123, Newgate-street.

Just published, price 5s.

**Practical Observations on a New**  
METHOD OF TREATING GONORRHEA, and on the CURE of INVERTE-  
RATE CASES of GLEET and GONORRHEA by BLISTERING. By  
JOHN L. MILTON, M.R.C.S. Lond.  
London, J. Churchill, New Burlington-street.

Just published, 8vo, price 2s.

**A Letter to the President and**  
FELLOWS OF THE ROYAL COLLEGE OF PHYSICIANS, in  
relation to the Evidence cited in their late Report on the Treatment of  
Epidemic Cholera. By JOSEPH AYRE, M.D., Chairman of the Sanitary  
Committee of the Local Board of Health.  
London: John Churchill, New Burlington-street.

On the First of August, 1864, was published, price One Shilling,

**The Pharmaceutical Journal,**  
No. CLVIII.—containing the  
TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

CONTENTS.—The Pharmacopœia Committee of the Pharmaceutical Society—  
Late Hours of Business—On Diatomacea—The Pterocarpus Erinaceus, or Kino-  
Tree of West Africa—Specimens of Peruvian Barks—Wai-fa, the unexpanded  
Flower-Buds of Sophora Japonica—A New Variety of Balsam of Copaiba—The  
Use of Mushrooms in Russia—Substitutes for Citric and Tartaric Acids and  
their Salts in Dyeing—The Uses to which Turf might be applied in Ireland—  
Manufacture of Sulphate of Magnesia from Bittern, the "Rough Epsoms" of  
the Alum Manufacturer, Native Carbonate of Magnesia, Magnesian Schist,  
&c.—The Mineral Waters of Harrogate—The Cinchona Barks—The California  
Nutmeg—Early Closing Association: Meeting of Chemists—The Fluid Pound,  
&c. &c.

VOLUME XIII. may be had in boards, as well as the preceding volumes,  
price 12s. 6d. each.

London: John Churchill, New Burlington-street; MacLachlan and Stewart,  
Edinburgh; and Fannin and Co., Dublin.

**"The Times."—The "Evening Mail,"**

being half the price of "The Times," is published in London three  
times a week, on the afternoons of Monday, Wednesday, and Friday, in time  
for the country post. The "Evening Mail" contains all the matter of "The  
Times," (except the Advertisements), and includes the Second Edition of  
"The Times," and the Corn and Cattle Markets, &c., on the day of Publi-  
cation. Subscription 32s. 6d. per half year in advance. This paper, and  
all the London newspapers, supplied by W. DAWSON and SONS, Abchurch-  
yard, and 74, Cannon-street, City, London. Established 1809.

**Mayall's Daguerreotype Portrait**

GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433,  
West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DA-  
GUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC,  
and LITERARY MEN, Panoramas from Nature, and Views of the late  
Exhibition; together with specimens of every improvement in the art. The  
originals of THE LANCET PORTRAITS on view.

**Allen's Illustrated Catalogue, con-**

taining size, price, and description of upwards of 100 articles, consisting  
of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes,  
Writing-desks, Dressing-cases, and other travelling requisites, forwarded on  
receipt of two stamps.

Allen's Registered Despatch-box and Writing-desk, their Travelling-bag  
(with the opening as large as the bag), and the new Portmanteau, containing  
four compartments, are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Furniture, and  
Military Outfitters, 18 and 23, Strand.

**H. Silverlock's Medical Label Ware-**

house, LETTER-PRESS, COMPOSITION, and LITHOGRAPHIC PRINTING  
OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at  
H. Silverlock's establishment every kind of Label they  
can possibly require; and also that every description of Engraving, Letter-  
press, Copper-plate, and Lithographic Printing is executed by competent  
workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent  
per post on application.

**Gas-heating Apparatus.—H. Mather**

begs to call attention to his GAS-COOKING STOVES, which will  
cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons,  
Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which  
can be put anywhere, Eight Shillings each.—Gas Stoves for Operative  
Chemists, Jewellers, and all purposes where heat is required.—Manufactured  
on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Trades-  
men, and others, sending in the first instance to SHILLABEE'S OFFICE,  
CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT,  
BRIGHTON, instead of employing their Upholsterer, or the nearest Under-  
taker, who, not possessing the needful requirements, resort to the Funeral Fur-  
nishers, to hire them, and consequently inflict twofold profits.

Shillabee's Establishment combines under one charge, to any scale of pomp  
and humility desired.

Funerals of every class, and the most varied description of conveyances,  
old and new styles, and first-rate equipments, at charges so moderate as to  
defy competition. Catholic Fittings from Paris. No extra charge within ten  
miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten  
Guineas; Tradesman's, £3; Artisan's, £2 and upwards.

Originated in 1842.

**Infants' New Feeding Bottles.—These**

celebrated Nursing Bottles, the best Artificial Mother ever invented,  
enabling the most delicate infant to feed from its birth with the greatest  
comfort and ease, are adapted to milk, biscuits, and all kinds of food. The  
Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beauti-  
ful an imitation of nature, that no infant ever refuses it.—BENJAMIN ELAM,  
196, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

**Mineral Waters.—W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received  
a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS  
of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg,  
Kissingen, Vichy, Seltitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-  
de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22a, Henrietta-  
street, Cavendish-square.—N.B. Balls and evening parties supplied with  
German and Struve's Artificial Seltzer Water on advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

**Blake's Aërated Citrate of Potash**

WATER.—BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, have  
recently prepared an Aërated Solution of Citrate of Potash, which they beg  
to introduce to those members of the profession who may desire it for the  
use of their patients. It will be found a valuable auxiliary in the treatment  
of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and  
Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicar-  
bonate in each bottle; Soda, 15 grains; Magnesia, 12 grains; and Ammonia,  
10 grains. Seltzer, Vichy, and other foreign waters, from the respective  
analyses.

**Hooper's Inspissated Juice of Tarax-**

ACUM, prepared by dry air, can be obtained in the following  
forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SARSAPARILLA; dose, a  
dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught,  
and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's  
Taraxacum and Sarsaparilla."—Dr. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous  
Affections, and Constipation, these preparations have long been prescribed by  
the most eminent of the Faculty with the best results. The above Extracts of  
Taraxacum, when mixed with water, produce a milky appearance, similar to  
the juice in its fresh state.

INSPISSATED JUICE OF COTYLEDON UMBILICUS, for Epilepsy, intro-  
duced by Mr. Salter, of Poole (see "Medical Gazette" of March 2nd and May  
11th), for whom Mr. Hooper first prepared it, and has continued to do so, Mr.  
Salter finding it to possess the properties of the fresh juice.

The following remarks of the Rev. A. Leapingwell show the value of Tarax-  
acum when properly prepared:—

"So valuable a preparation as your Taraxacum can need no recommendation  
from me; still I feel bound to say its beneficial effects have surpassed my most  
sanguine expectations. My mother, who is in her 79th year, and who through  
the greater part of her life has been a martyr to liver complaint, appears to  
have had ten years added to her life by a three months' use of it.

"I remain, yours truly,

"ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Seaford.

BRIGHTON SELTZER WATER, 4s. per doz. Other factitious Mineral  
Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East,  
London. Laboratory, Great Scotland-yard.

# Recherché Wines! — First-growth

Wines only! At the following very reduced prices, on cash terms only:—

Sherry—"Amontillado and Mentilla character." In Dock, at £53 per Butt, £26 per Hhd., £13 per Quarter Cask. Duty paid—£21 per Quarter Cask, £12 per Hhd., £94 per Butt, 42s. per dozen.

Port.—Very rare old Wines, 4s. and 5s. per dozen. Connoisseurs, who cannot suit their taste, except on rare occasions, are invited to try these Wines. Vintage Ports for laying down.

The qualities of Wines most prized being different, some preferring pale, others brown, some dry, some fruitiness and smoothness, all of which are consistent with purity, gentlemen are solicited to call and taste the Wines at Mr. HAMMICK'S Office, No. 11, Pall-mall, London.

First class! Champagne, Moselle, Hocks, Claret, Sauterne, &c., at the most moderate prices.

These Wines are patronised and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples, with List of Prices, forwarded on application.

There being no credit on freights, neither on duties, and to buy in the best market, cash terms command every advantage, and are essentially requisite to obtain the best and purest Wines at the lowest possible prices.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

## GREAT REDUCTION IN PRICE OF

# Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

# The Cholera Prevented by the

destruction of all noxious effluvia.

CREW'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CALORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.

FURTHER GREAT REDUCTION IN PRICE.

# Crew's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crew's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

# Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality, Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

# Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1864.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipidated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

THARAXACUM (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipidation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

JOZEAU'S COPAHINE MÈGE

Or SACHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1862.) Price per 100, 4s. 6d.; 50, 2s. 6d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 46, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

# Oleum Jecoris Aselli.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.

Approved of and recommended by BERZELIUS, LIEBIG, WOHLER, JONATHAN PEREIRA, FOUQUIER, and numerous other eminent medical men and scientific chemists in Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the elements of the bile—in short, all its most active and essential principles—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

A pamphlet by DR. DE JONGH, with detailed remarks upon its superiority, directions for use, cases in which it has been prescribed with the greatest success, and testimonials, forwarded gratis on application.

The following are selected from some of the leading Medical and Scientific Testimonials in favour of Dr. de Jongh's Cod-liver Oil.

## BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

(Signed)

"DR. JUSTUS LIEBIG.

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

## Dr. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

"JONATHAN PEREIRA.

"Finsbury-square, London, April 16, 1861.

"To Dr. de Jongh."

Sold Wholesale and Retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by ANSAR, HARFORD, and Co., 77, STRAND, Sole Consignees and Agents for the United Kingdom and British Possessions; and by all respectable Chemists and vendors of Medicine in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d.

IMPERIAL MEASURE.

## Anglo-Australian and Universal FAMILY LIFE ASSURANCE COMPANY.

Incorporated under Act of Parliament, 7 and 8 Vict., cap. 110.  
For granting Infantile, Adult, and Matrimonial Assurances, Annuities Endowments, Loans, and Guarantee; and for the Purchase of Reversionary Property, Life Interests, &c., with special application to Infants, Emigrants, and Gold Miners. Seventy-five per cent., and eventually 100 per cent., of the entire profits, divided on a new and most equitable principle among the Members.

Capital Fund £150,000, in 15,000 Shares of £10, each.

First call £1 per Share. The paid-up portion of the Capital, with its accumulations, to bear a Dividend at the rate of not less than £5 nor more than £10 per cent. per annum, with a Bonus of 25 per cent. of the Profits. No commission paid to agents or others. No premiums forfeited through inability to continue them.

Proposals for every variety of Assurance, Prospectuses, and further information, can be had on application, by letter or otherwise, to

JOHN NEWTON, Secretary.

N.B.—The attention of the Medical Profession is particularly invited to a consideration of the liberal dealing of this Company towards the Profession. London Offices: 6, Cannon-street West, City.

## The Patent Impermeable Corium or

Lamb-skin, (the invention of Dr. Scott Alison,) for Fomentations and External Application of Medicinal Agents; already used in the Navy, despatched by order to Turkey, and employed by the highest medical authorities, is to be had plain, in silk, &c., of the leading chemists, and of Mr. HAMILTON, 27, North Audley-street, Grosvenor-square.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING: for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT OF INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropa, Belladonna, Cytisodon Umbellifer, &c.): also to his Liquefied Taraxaci, Liquefied Galli Aparinis (a valuable alternative), Liquefied Parietaris (diuretic), and Liquefied Beliz (prepared from the Egle Marmelos, or Indian Basil), for Dysentery and Diarrhea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edwards-street, Portman-square.

## Shower and all Domestic Baths.—

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECURRENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-Baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

## Briet's portable Gazogene, OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SELTZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogene-Cooler  
PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN, and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—440, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	98,500	£ 3,439 0 1
1852	677	278,855	10,808 12 2
1853	1025	413,785	15,836 3 6

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DUTY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## Darby and Gosden beg to call

the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.

140, LEADENHALL-STREET, CITY.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Planter's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are admirably ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place, Pall Mall, London.

## Scientific Professional Apparatus,

manufactured and sold by HORNE, THORNTWHAITE, and WOOD, 121 and 123, Newgate-street, London, who invite attention to the following articles, which have given universal satisfaction:—

MEDICAL ACHROMATIC MICROSCOPES, in Case, for Anatomical Urinary Deposits, &c., £2 10s., £5 5s., and upwards.

ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism of great quantity, and of the only form and construction suitable for Medical Application, in portable Case, £3 3s., £5 5s., and £8 8s.

URINOMETERS, gilt metal, 14s.; glass, 4s. 6d. In Case, for pocket, with Thermometer, Acid, &c., 21s. and 35s.

APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY. In Cases, £3 3s., £5 5s., and £10 10s.

\*.\* Any required information and price-lists forwarded on application.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

## LETTSONIAN LECTURES

## On Medicine.

DELIVERED BEFORE THE

MEDICAL SOCIETY OF LONDON,

DURING THE SESSION OF 1853-54.

By THEOPHILUS THOMPSON, M.D., F.R.S.,  
PHYSICIAN TO THE HOSPITAL FOR CONSUMPTION.

## LECTURE III.

## ON THE TREATMENT OF PULMONARY CONSUMPTION.

*Palliative treatment. Night perspiration. Diarrhoea. Cough. Adaptation of treatment to the element of the disease and to its different stages. Digitalis. Animal and vegetable oils: Sperm; Seal; Malabar; Cod; Sunflower. Cocoa-nut oil shown to have properties analogous to that from cod-liver. Introduction of oil by the skin. On the correction of hereditary tendency to phthisis and scrofula. Conclusion.*

MANY years have not passed since the treatment of pulmonary consumption was almost confined to the palliation of urgent symptoms, and no encouragement was afforded for the expectations we may now occasionally entertain of witnessing permanent amendment under improved methods of management—expectations which may be cherished chiefly in cases subjected to treatment at an early period, and in those instances of advanced disease where cavities are distinctly bounded, and tubercular infiltration does not exist extensively in the lungs.

Even as respects palliative measures there has been of late some accession to our resources. In support of this assertion, let me briefly notice three distressing incidental symptoms—namely, night perspirations, diarrhoea, and cough. In the treatment of night perspirations, sulphuric acid was formerly the remedy most commonly employed, and with very partial success. Other acids, such as the gallic and the acetic, are probably more effectual for the purpose. Considerable abatement of the symptoms may often be derived from the use of a night-dress dipped in sea-water or a solution of salt, and dried; but a most important improvement in the treatment of this symptom is the administration of oxide of zinc at bedtime, in doses of about four grains, combined with any anodyne extract, such as henbane or hemlock. This property of the oxide was first observed by Dr. Robert Dickson. The mode of action of the remedy is undetermined, but the relief induced by its administration is more decided than from any other medicine with which I am conversant.

One of the most trying of the complications of phthisis is diarrhoea. It is not my present intention to attempt a description of the various modifications of this condition, but a few practical remarks on the subject may not be inappropriate. When diarrhoea is associated with intestinal ulceration, or with an appearance of the tongue and other circumstances indicating irritation of the mucous membrane, the diet, notwithstanding the existence of debility, must be bland and unstimulating. Instances dependent on a relaxed state of the intestinal exhalants may require astringents. The peculiarities of the individual case must determine whether we select the preparations of silver, copper, or lead. My experience, however, during the last six years, has confirmed my impression, that of all the remedies which have been recommended for this affection, there is none more generally available than tris-nitrate of bismuth. This medicine, combined with a little gum and magnesia, and when necessary with Dover's powder, perseveringly employed, usually affects the object more permanently than other measures, and without inducing any opposite or collateral evils.\*

The variety of remedies employed for the relief of cough serves to show how intractable this symptom often proves; and I think we may assert that, till within a few years, sooner or later, opium, in some one of its many preparations, has usually become the chief reliance of the practitioner in its treatment. I rarely meet with instances where the inhalation of chloroform, combined with three times the quantity of spirits of wine, fails to relieve; but there are objections to the

indiscriminate use of so powerful a measure. Often the inhalation of camphorated spirits is equally effectual; sometimes the vapour of warm water, or infusion of hops. The simple expedient of swallowing a little oil slowly often gives more relief than the use of what are called intentional medicines. In some irritable conditions, tincture of aconite, in doses of four minims, is worth the trial. When expectoration is profuse, creasote, pyroacetic spirit, infusion of pitch, or balsam of Tolu, may be administered; but of all the remedies referable to this class, appropriate for cases accompanied with profuse expectoration, not one has proved in my hands so efficient as petroleum, or Barbadoes tar, the cough being frequently relieved, and the expectoration rapidly moderated, under its use.

On the treatment of hæmoptysis I need not dwell. Single doses of mercury, and a few saline aperients; antimony, even bleeding, may, in special cases, be requisite. Direct astringents, such as gallic acid and acetate of lead, may occasionally be required. In a larger proportion of cases, turpentine is the most satisfactory remedy, but not unfrequently it is inexpedient to attempt the sudden arrest of hæmoptysis, since, when moderate, it is rather useful than dangerous. Such are a few simple hints which I would venture to offer as derived from my own observations of the treatment of individual symptoms. It is not my present object to give an elaborate essay on the treatment of phthisis, but rather to confine my remarks to the statement of opinions either formed or confirmed by my special opportunities for investigation. I feel that a detailed review of the subject would scarcely harmonize with the broad principles which it was the object of preceding lectures to illustrate. The symptoms thus briefly noticed are but incidental evils springing from that error of the organism which I formerly described as exhibiting itself locally in faulty cell-formation, generally in defective blood, and disturbed, imperfect, hurried action. No satisfactory or systematic view can be presented on the subject of treatment without regard to the different degrees of progress of the morbid action.

The disease may be only threatened. Rapid growth, some approach to the phthisical physiognomy, a pearly or somewhat coloured margin to the gums, observed in a member of a consumptive family, although not considered an invalid, may be the chief indications of the impending disease. In such instances well-arranged exercise, especially of the arms, as in fencing or archery, the adoption of judicious plans of education, and the appropriate choice of climate or employment, may often avert decided mischief.

But supposing local pulmonary disease to be commencing, as evinced by a disposition to chilliness; a feeling of oppression under the sternum; gnawing sensations about the scapula; effort in making a thorough expiration; prolonged expiratory murmur; hæmoptysis; expectoration, of the character described in my first lecture, (see figs. 3 and 4,) as resembling isinglass in appearance; a pulse evincing the characteristics formerly described.—Congestion should then be obviated. A dose of blue-pill, followed by an aperient, may be administered. Sometimes the application of a few leeches applied over the threatened part, and the administration of liquor potassæ with infusion of cascarrilla, may be advantageous.

But softening may occur, the second stage be established, with the clicking, or "humid crepitation," as an auscultatory sign, expectoration exhibiting, perhaps, elastic tissue under the microscope, as well as characteristic cells of tubercular character. The treatment must then be cautious, unstimulating, but strengthening, exposure to cold or heat must be shunned; change to a tropical climate is now dangerous, and even the excitement of sea air may do harm.

When the third stage is established, indicated by gurgling or amphoric respiration or cough, we have to adopt such treatment as shall strengthen the constitution of the patient, so as to become tolerant of the local disorganization, reparation of which can be expected only under very favourable circumstances and assiduous care.

Such general statements as those which I have offered will not, however, satisfy minds anxious to make a distinct and decided step in the treatment of this fatal disease. Do the modern acquisitions furnished by pathology, zoo-chemistry, and histology, assist us in establishing any principle calculated to determine the appropriate treatment? The chemical condition of the blood of the consumptive patient is, in some respects, analogous to that characterizing chlorosis; but it is not the true olichæmia of that disease, and iron will not cure, although it may often be beneficial as an auxiliary.

We have described the deviation from the natural condition in the process of cell-formation as the earliest local manifes-

\* See Transactions of the Royal Medical and Chirurgical Society, vol. xxxi., page 305.  
No. 1614.

tation of phthisis. Will our knowledge in this respect assist our decision? Fat degeneration, tubercular degeneration, and cancerous disease, in their cellular relations, may be contrasted. Cancer-cells as compared with phthisical, having, perhaps, more of albumen and less of fat, but the nature of the action is more important than the attendant chemical conditions. In fatty degeneration, we have life failing; in tubercle, running out by undue rapidity; in cancer, running riot.

Is there any kind of treatment calculated to moderate this undue action, and at the same time give tone? I have lately tried the influence of digitalis. The effect of this remedy in lowering the pulse is well known; but I have been interested to observe that the rule obeyed by the phthisical pulse is no longer strictly applicable when the sedative influence of digitalis has been produced on the heart. If the anomaly of pulse formerly described depends on the presence of the tubercular element in the blood, the restored susceptibility to change of posture might seem to imply that some effect is produced on the tubercular disease. It is worthy of note that some of the most able physicians of the last century attached great importance to the use of digitalis in pulmonary affections. Dr. Ferriar's remarks on the subject evince an honesty and intelligence which entitle them to our respect. "Digitalis," he observes, "has often quieted the pulse, relieved the cough, and given the patient feelings of recovery." He adds, "the patient's ultimate recovery is not to be confidently expected, even when the pulse is reduced in velocity, and the symptoms are evidently mitigated by the action of the medicine. Many disappointments have taught me not to be elated by one or two instances of success, and I should deceive the public if I presented to them only examples of fortunate practice. To cure (such disorganization as we sometimes observe after death) would require an effort of the power which first created the living body."

It would be unreasonable to disregard the assertion made by so cautious and trustworthy a physician, that, after seven years of careful experiment (from 1792 to 1799) he had come to the conclusion that digitalis, with iron for the scrofulous phthisis, with opium for the florid, enabled him often to hope for a cure under circumstances which would formerly have precluded all hope of recovery. On the whole, we may venture to suggest that the endemic introduction of digitalis, by means of a blistered surface, may occasionally prove worth the trial, as an auxiliary measure, at the commencement of some cases of consumption.

The importance of careful and discriminating attention to the peculiarities of each individual constitution must not be overlooked; still there is one medicine so safe and, in a large proportion of cases, so useful, that I shall be excused for giving it a prominent consideration in the remainder of the lecture. Perhaps there is no substance, the value of which has been in a short time established by so large an accumulation of evidence, as cod-liver oil. About ten years since, in my office as one of the Pothergillian adjudicators, some remarks in one of the competing essays, regarding the efficacy of this remedy in scrofula, induced me to try the medicine in consumption. As far as I am aware, the earliest extensive trial of cod-liver oil in London was made by me at the London department of the Hospital for Consumption, and the results of that investigation were detailed to this society, the coarse kind, such as is used in tanning leather, being employed. Of the first thirty-seven patients, ten were greatly benefited, and increased materially in plumpness and strength; twelve were slightly improved; twelve remained unchanged; and three were obliged to discontinue the remedy, on account of the nausea which it occasioned. Under the use of this oil all the symptoms were ameliorated; the pulse became slower, the cough and expectoration lessened, the night perspirations abated, diarrhoea ceased, and the urine often ceased to exhibit the excess of uric acid. The diminished liability to hectic in patients thus treated furnished remarkable evidence that this variety of fever has more relation to conditions of blood than to local disorganization. It is obviously a question of great practical interest, whether cod-liver oil owes its efficacy to some ingredient not present in other oils. With a view to determine this question I tried various other oils, such as sperm and seal, and the result was a conviction that fish oils generally resembled one another in their remedial properties, although differing in their aptitude for digestive assimilation in the human stomach. It seemed to me an object of interest to determine whether other animal oils not derived from the liver possessed similar powers; and in the year 1849 I made many experiments in the use of neat's-foot oil. Of the first fourteen patients to whom I administered the substance, seven were essentially benefited, (in three the disease was arrested,) in five there was no obvious improvement; only two lost ground. The oil of neat's foot,

therefore, can fairly be compared with that of cod's liver, although, being equally disagreeable to the palate of most patients, it is not likely to come into general use. Dr. Radcliffe Hall, of Torquay, having incidentally heard of this remedy, gave it a trial, and published a favourable account of the effects in the *Monthly Journal* for July, 1852. This physician, not having seen the description of my experiments, his statements furnish an independent confirmation of my conclusions. Neat's-foot oil would appear to be adapted to some cases in which there is too much irritation of the intestinal mucous membrane to bear the administration of the cod-liver oil.

I have also tried an animal oil obtained from a soft, solid fat found between the parchment and the leather skin of animals. The most remarkable properties of this oil are, its very slight tendency to become rancid, and its freedom from drying properties. It seemed not unreasonable to expect that it might prove as efficacious as neat's-foot oil; but as yet I have not been able to trace any important advantages to its use. I have tried an oil obtained from a species of fish abounding on the Malabar coast, and frequently with encouraging results. The inefficiency of almond and olive oil, excepting when combined with phosphorus, I have already reported. The result of these trials at first induced me to distrust vegetable oils in general; but happening eighteen months since to have a patient engaged in a cocoa-nut manufactory, it occurred to me to try the oil of this nut, which, from the nutritious qualities of the kernel, and the peculiar properties of the soap obtained from the oil, seemed worthy of special consideration. In the first instance, I tried the common oil—sometimes the solid, sometimes the fluid part. Subsequently, I have used a purified oil, (of which I show you a specimen,) which is obtained by pressure from crude cocoa-nut oil, as expressed in Ceylon and the Malabar coast from the copperah, or dried cocoa-nut kernel, and refined by being treated with an alkali, which deprives it of its unpleasant smell and taste. It is then repeatedly washed in distilled water, in order to separate any of the saponaceous compound formed by the combination of the alkali with the impurities and rancid matter of the oil. It burns with a feeble blue flame, and is undrying. For the supply of this oil, and for much valuable aid in my investigations, I am indebted to Mr. George Wilson, of Messrs. Price and Company's establishment. Mr. Wilson has given to my suggestions the ready attention of an enlightened mind, and I am happy to bear witness to the value of the sympathy and co-operation which the well-informed laity can often render in our medical endeavours to apply scientific research to purposes of practical usefulness.

Of the first thirty cases of phthisis in which I administered the cocoa-nut oil, nineteen were much improved, five remained without material change, and only six got worse. Of the last twenty-three, fifteen were materially benefited, three remained unchanged, and five became worse. Three of these five were in so hopeless a condition at the time of commencing the remedy, that my clinical assistant thought it scarcely fair to include them in the report. I was careful, for the most part, to avoid the concurrent use of any other medicine; and it is proper to mention, that a large proportion of the patients had previously taken cod-liver oil, and discontinued it, from being disappointed of benefit.

Another oil which I have tried is that of the sunflower seed. It is slightly drying, and burns with a smoky flame, showing a large proportion of carbon. Although the sunflower seed is much used for feeding and fattening poultry, the oil has not, medicinally, afforded me much satisfaction. I have occasionally alternated it with the animal fat oil. Each of these oils has occasionally done a little good after the failure of the other, but no results have occurred worthy of record.

I felt curious to ascertain whether chemical science could suggest any explanation of the diversity of remedial properties in different oils, and, with this object, obtained from Mr. Dugald Campbell an ultimate analysis, which is subjoined, of some of the oils which I have employed.

#### Ultimate Analysis of Oils.

	Carbon.	Hydrogen.	Nitrogen.	Oxygen.
Cod-liver oil ...	80.18	13.72	0.246	5.354
Neat's-foot oil.	64.33	12.50	0.064	23.106
Cocoa-nut oil...	69.62	12.49	0.060	17.830
Olive oil.....	69.38	13.47	0.058	17.092

It will be observed that cod-liver oil differs materially from

the other oils in its elementary composition. The remarkable difference apparent between the proportions of these elements, especially of carbon and oxygen, in cod-liver oil, as contrasted with the other oils, might lead us to suppose that its superiority might thus be explained; but the inadequacy of such an explanation becomes obvious, when we further pursue the inquiry, and observe a close correspondence in elementary composition between olive oil, which may be regarded, when introduced into the stomach, as, medically, almost inert, and cocoa-nut oil, which is fairly comparable in efficacy with the oil obtained from the cod.

I have elsewhere supplied evidence,\* that the oils which I have chiefly employed evidently modify the condition of the blood. It is perhaps in this way that they accomplish more in correcting the morbid element on which phthisis depends, at whatever period administered, than any other remedy with which we are at present conversant. Can they be advantageously introduced by friction? For the last six years I have frequently adopted this plan, sometimes as a substitute, at other times as a supplement to the internal administration of the remedy, and often with excellent effects. In the first patient with whom I adopted this plan six years since, who was affected with vomica and exhausted by diarrhoea, the principal treatment consisted in rubbing in an ounce of the oil flavoured with lavender night and morning. He was restored to average health, and some years afterwards died of another disease. It is very rare that any measure of real value proves absolutely novel. I had till lately overlooked the fact that Aretæus, Celsus, Aurescians and Celsus, all speak ofunction with oil in phthisis.

Even neat's-foot oil at the commencement of this century was used by a quack named Samuel Braunston of Shuckburgh, in Warwickshire, for the cure of every disease, and cocoa-nut paste is used in the East for fattening poultry, although, as far as I am aware, its medical efficacy was hitherto unknown. I cannot believe, however, that the oil acts exclusively in the way of supplying nutriment, since on the use of a quarter of a pint a week a patient will often gain one or two pounds in weight. It seems to modify the condition of the granules which enrich the blood, and to dispose them to the calm progression of change by which they are made to contribute to the production of healthy structure. I have seen an ulcer with a surface of deficient granulations brought speedily into a healthy healing condition by the daily application of a drop or two of cod-liver oil. Let a few granules be brought into healthy action, and the mass of granules seem to adapt themselves to the law of improvement. The part of the ulcer not directly in contact with the oil is still modified by its influence, and I have sometimes been induced to suppose that something analogous to the contagiousness of action, (to use an expression of Liebig, as applied to some chemical phenomena,) must be concerned in such results. Let me mention, as an instance of this action, that nitric acid will not readily influence platinum; but if this metal be mixed with silver, the action which is immediately induced by the acid on the latter is soon extended to the platinum.

It is a popular, and probably correct, opinion amongst whale-voyagers, that their expeditions are a cure for consumption, the quantity of oil under such circumstances drank and introduced by the skin may contribute to a result which indeed may be further promoted by their active exercise and exposure to the air. In some hunting countries great efficacy is attached to drinking the blood from the jugular vein of a young doe. In both these instances collateral circumstances must be included in the consideration, and the same remark will apply to the experience of various observers, adduced by Dr. Simpson,† of the comparative immunity from scrofula and phthisis enjoyed by those who work at certain manufactories, where oil, being largely employed, is believed to be introduced into the system of the workpeople through the lungs and the skin; but the statement is well deserving of careful and extensive investigation. Neat's-foot and cocoa oil answer well, endermically, and are not offensive. In conducting a course of oil treatment we must not assume that the oil can be indiscriminately used without regard to the conditions of the system, and more especially of the mucous membrane. If a state of erythema exists, the preliminary administration of salines and prussic acid will often be desirable. Since the introduction of cod-liver oil, consumption has certainly been divested of many trying incidents; the progress of the disease is often long delayed, and the final sinking stage abridged. Often the fatal termination is ushered in by a sudden attack of congestion. I am inclined to think that this condition might occasionally be obviated, and that when the pulse has been for some time gaining strength, and the patient's weight

increasing, the oil should occasionally be suspended, aperients administered, and, should any sensation of thoracic oppression be experienced, cupping-glasses applied. Such measures, when well-timed, rather promote than counteract the appropriate effects of the oil.

Let us not forget, Sir, that the class of remedies we are considering has no exclusive adaptation to consumptive disease, but probably produces its good effects by correcting a condition which, in some degree, appertains to other disorders—for example, to anæmia in its various forms, whether associated with neuralgia, hypochondria, or hysteria, and, above all, that it is particularly suited for children of scrofulous constitution.

If hereditary tendency to phthisis exists in any family, it is surely of great importance to anticipate the pulmonary era, and introduce oleaginous medicines at an early period. The practice of daily inunction with preparations of neat's-foot or cocoa oleine might, I conceive, prove of peculiar efficacy. Were there time, I might be tempted to dwell on this subject as affording a practical illustration of a position with which I began my first lecture,—namely, that special observation is chiefly useful by conducting us securely to general laws. In the knowledge of laws dwells practical power and prophetic aptitude. It is by cautious experiment and scientific method we may hope to dissipate the mists of theory, and attain to discoveries sought in vain by the blind and guideless industry of former days.

In conclusion, gentlemen, allow me to say that your courteous attention to the lectures which I have had the honour to deliver will be a subject of grateful recollection in my future career. A motive to continued exertion is supplied by the example and sympathy of so many eminent members of this Society, thus willing to leave the attractions of domestic repose or of profitable engagements, in order to promote the association of scientific research with practical usefulness. It is a privilege to be incorporated with such a fraternity, since men whose minds are habitually exercised for the public good are amongst the greatest boons that Providence has given to the world.

## ON THE USE AND ABUSE OF POTASSA FUSA AND POTASSA CUM CALCE

### IN THE TREATMENT OF UTERINE DISEASE.

By J. HENRY BENNET, M.D.,

PHYSICIAN-ACCOUCHEUR TO THE ROYAL FERN HOSPITAL, &c.

(Concluded from page 24.)

WHEN a small caustic cylinder is merely passed gently inside the cervical canal, and only allowed to remain a few seconds,—all that is generally required,—the destruction of tissue is very slight, and there is afterwards no very marked tendency to contraction. If a more decided action is produced, however, the subsequent tendency to contraction is great, and unless counteracted by dilatation during the process of healing, may end in all but complete obliteration of the cervical canal, and that by a cicatricial tissue which it is very difficult to dilate. Several instances of the kind have come under my notice from the country. In one lady, I was a fortnight before I could discover the external orifice of the canal, and then I only found it through the advent of menstruation, the blood bulging behind the mucous membrane, for I had been previously dilating the orifice of a mucous follicle. This lady, aged forty, had scarcely seen any show for months, although the menstrual molimen came periodically; and had become liable at those times to severe hysterical attacks bordering on epilepsy. These attacks all but ceased on a free exit being procured for the menstrual discharge. I have now under my care a young lady aged twenty-six, in whom the cervical canal was so narrowed, from the same cause, that I was not able to pass the smallest bougie. Menstruation took place with extreme difficulty, and guttatum. Her state was one which it was very difficult to remedy, for the stricture was high up—half an inch from the os—and extended some distance. That such a cicatricial stricture must be difficult to remove stands to reason, as the union between the walls of the canal is no doubt very intimate. Two years ago I had an opportunity of examining the uterus of a former patient of my own, similarly, but more cautiously, treated some years previously, and found the cervical canal, although quite permeable, much diminished in calibre by ex-

\* Proceedings of Royal Society, vol. vii., No. 3.

† Edinburgh Monthly Journal, April, 1863, pp. 372—80.

tensive adhesions. This lady died at the age of thirty-seven of cancer of the cecum; the uterus was quite healthy.

These and other similar cases which I have met with prove that great care should be shown when this plan of treatment is followed, but not that it is one which should not be adopted if imperatively required. If the caustic is not too severely applied, on the one hand, and, on the other, the canal is kept open by passing a common bougie once or twice a week regularly, until the surface acted on is healed, and all tendency to contraction have ceased, no morbid diminution of the calibre of the cervical canal can ensue. Many of the cases which I see being extreme ones, I not unfrequently have to resort to this mode of treatment, and yet I have very seldom had occasion to dilate the cervical canal afterwards; and when I have, it has been because accidental circumstances have taken the patient out of my reach whilst under treatment. As a rule, I should say that no patient, in whose case the caustic potash has been applied to the cervical canal, should be lost sight of in less than six weeks, and during that time the canal should be kept open by the passage of a moderate-sized bougie once or twice a week.

The other accidents which may follow the use of caustic potash are, extension of the caustic to the vagina, and extension of the inflammatory reaction produced to the uterus and peritonæum. These accidents, like the former, may be avoided by common care and prudence. Potassa fusa itself ought, I think, to be discarded, now that we have in the potassa cum calce cylinders such an admirable and safe substitute. All the instances in which I have seen the vagina compromised have been cases in which pure potassa fusa had been used. It is so extremely deliquescent, that it is all but impossible to always avoid its running into the adjoining parts. As regards the extension of the secondary inflammation, that need not be feared if due precautions are taken both before and after the caustic is applied. All acute or even sub-acute inflammatory action should be first subdued, and the proper time should be chosen for the operation. Four or five days after menstruation is the best time, as it allows two or three weeks' quiescence from menstrual molimen. Lastly, the eschar produced should not be too extensive.

One of the chief arguments that have been adduced against the use of caustic potash to the neck of the uterus is, that it produces cicatrices that may interfere with the process of parturition. This is merely a theoretical objection, not founded on observation, and devoid of truth. The fact is, that the faintest trace of even a deep eschar produced in this region, either by a caustic or by the actual cautery, ceases to be visible after the lapse of a few months. So far from causing induration, the action of these surgical agents is to melt and soften induration of the cervix when the latter is the result of chronic inflammation, as is usually the case, by favourably modifying the morbid nutrition of the parts diseased. The idea of hard cicatrices has been taken from the observation of what occurs in the skin, without taking into consideration that the structure of the skin and of mucous membrane is essentially different. In the skin there is a fully developed fibrous framework, which is the principal foundation of the hard cicatrix that follows any loss of substance in which it is involved. This fibrous framework is merely rudimentary in mucous membranes, and thence the facility with which any loss of substance in them is repaired. This we see exemplified in the mouth and intestinal canal, where all traces of ulcerative action are eventually lost. In the cervix uteri we see how nature repairs divisions and losses of substance, by observing what occurs after the lacerations of the substance of the cervix, which are so common in parturition, and which, when no subsequent inflammation sets up, merely leave a soft notch as the trace of their occurrence.

Such being the case, it is clear that the application of potassa fusa to the cervix uteri, so far from hardening the organ, and proving an impediment to future labours, acts in the reverse manner, positively facilitating parturition, by removing chronic inflammatory hypertrophy. Indeed, I may here remark, that the more I progress in life the more I become convinced of the truth of an assertion which I made many years ago—viz., that most of the cases of rigid, undilating os uteri met with in practice are occasioned by chronic inflammatory disease of that organ, and not by constitutional conditions, spasms, &c., an important fact in practical midwifery.

In concluding these remarks on the use and abuse of caustic potash in the treatment of inflammatory disease of the uterus, I wish to lay stress on the fact, that I merely recommend it, and resort to it, when there is actual disease present, when the cervix is the seat of chronic inflammatory action, intractable to all other agents, general and local, and when the hypertrophy

is caused and kept up by such disease. In those cases of hypertrophy in which the cervix is merely passively enlarged, in which inflammatory action either does not exist or has given way to treatment or time, it ought not to be resorted to. The enlargement may then be safely left to nature and to general treatment. The absorbent powers of the uterus are, perhaps, greater than those of any other organ in the economy, and are generally sufficient, in the course of time, to fine down the enlarged cervix, when all actual disease has been removed.

I must be allowed to add, that the potassa cum calce cylinders constitute a very valuable and manageable caustic, whenever such an agent is required, for the destruction of chancres, the treatment of indolent sores, &c. I have found it of great use in the treatment of hemorrhoids, and, in some cases, preferable to the nitric acid, which has been of late so much recommended.

Grosvenor-street, 1854.

## ON THE TREATMENT OF CHOLERA.

By W. WILKINSON, Esq., Sydenham.

As cholera appears now unfortunately to have made its appearance once more amongst us, I would beg to offer some suggestions as to its treatment, which I hope may prove of some practical utility, and I do so with the less reserve, as there seems to be some variety of opinion upon the subject, and as there are few writers who appear to me to treat the subject in a sound common-sense manner. I would also beg leave to hint, with the greatest respect, that unless the treatment of this formidable disease, as well indeed as that of most others, be not based upon broad scientific principles, the *vis medicatrix nature* had better, as a general rule, be allowed to work its own way.

Cholera may be divided into three stages—

The first, or preliminary stage, being diarrhœa, painless or otherwise.

The second, diarrhœa continued, motions extremely thin, and devoid of fecal smell, cramps, &c.

The third being the stage of collapse, with unconsciousness, &c.

The first stage may be generally relieved by the exhibition of a *stimulant* emetic, which, by evacuating the stomach, prevents any accumulation of irritative matter there, and by its revulsive power produces a general alternative effect. This is to be followed by the following pills:—Chloride of mercury, five grains; ipecacuanha powder, half a grain; soap and opium pill, ten grains: divided into three pills.

The calomel as well as the ipecacuanha to act upon the secretions, and thus relieve the bowel of any viscid irritative matter; the opium to relieve or prevent pain, nervous irritation, and excitement, (so constantly followed by depression;) and with the ipecacuanha to produce an effect upon the capillaries of the skin, and thus cause a sympathetic derivative action. This may be followed by an evacuant, consisting of rhubarb and magnesia, with compound cinnamon powder and water.

This, even in the early part of the second stage, will be sufficient sometimes to cure the patient; but if the serous fluid lost be considerable, or if the disease should run into its third stage, it is of importance to administer some astringent which can be depended upon, together with some medicine, so to uphold or stimulate the nervous power, as to prevent entire loss of control over the capillaries of the intestinal mucous membrane.

From my own experience in diarrhœa and some few cases of cholera, I can corroborate the opinions of several members of our profession as to the efficacy of sulphuric acid; therefore I should—in every case in the second stage, after the preliminary treatment, or immediately in the third stage, when, from the copious action of the bowels, the preliminary treatment would be unnecessary—prescribe, dilute sulphuric acid, half a fluid drachm; strychnia in acid phosphoric solution, one-sixteenth of a grain. This medicine to be taken as frequently as the urgency of the symptoms might render it necessary. The sulphuric acid may be depended on, I think, as an astringent, and the strychnia (as mentioned in a recent paper of mine, published in THE LANCET) would also be of the greatest benefit to uphold or stimulate the nervous power, and thus prevent that loss of control over the capillaries, which seems productive of such infinite mischief.

If on trial these suggestions should be of use to the profession in reducing the mortality from this formidable disease, my object is accomplished.

July, 1854.

## ON A CASE OF TETANUS.

By EDWARD HODGES, M.D., Somersset.

RECOVERIES from tetanus being extremely rare, I forward you the following:—

On the 30th of December last, I was summoned to attend W. V—, a lad in his twelfth year, a light-haired, fresh-complexioned, and rather scrofulous-looking boy, on account of a lacerated wound of the great toe, necessitating the removal of a portion of its digital phalanx. The wound did exceedingly well, and the patient too, until the morning of January 11th, when the father called upon me, stating that his son could not open his mouth. I excited purgation without delay by the administration of a cathartic powder, and then resorted to the use of a hyoscyamus and camphor mixture, and directed the cervical spine and the lower jaw to be rubbed with a liniment. Powerful cathartics were (with due effect) again resorted to on the 13th, and followed by full doses of morphia, and for about ten days the patient was subjected to an antiphlogistic and sedative plan of treatment, calomel and tartar emetic being freely employed, as well as cathartics, opiates being administered nightly. This, however, did not prevent the disease extending to the extensors of the spine, and producing opisthotonos, and also to the muscles of the abdomen. About the 21st or 22nd of January, the symptoms of general excitement which had indicated the antiphlogistic treatment having subsided, though without diminution of the tetanic symptoms, that treatment was discontinued, and nocturnal doses of morphia only administered. On the 24th of January, the application of morphia (the hydrochlorate) to the wound was substituted for its internal administration—first in the form of powders, as the poultices were renewed, and subsequently by means of a piece of lint moistened with the following application:—Hydrochlorate of morphia, one scruple; tincture of hyoscyamus, two drachms; water, three ounces. This local treatment was continued until the 11th of February, when the general tetanic symptoms having much diminished, and the patient being able to protrude his tongue slightly, and to masticate a little, the foot was dressed and bandaged. The lad recovered perfectly, and is now to be seen daily about this neighbourhood, driving his father's (a baker) cart.

Though a considerable quantity of calomel was administered during the stage of arterial excitement, and also of tartar emetic, the gums were unaffected by the former remedy, and the latter produced no degree of emesis. On the subsidence of this stage, and the consequent discontinuance of the antiphlogistic treatment, the most liberal diet that could be taken by the spoon was allowed, and also some good bitter beer, and subsequently wine in small quantities.

I have only to add that the patient suffered no pain during the whole continuance of the complaint in the muscles most obviously affected, and that such as he did experience was of an equivocal character, and called pains in the bowels, which were sometimes severe at night, but which examination led me to refer to the muscles of the abdomen. It is not for me to say whether or not the treatment pursued in the above case had any influence in mitigating the violence of the disease, and preventing its full development, or in determining the final favourable result. Let the profession judge.

July, 1854.

## ON A CASE OF

## HEMATEMESIS, SUCCESSFULLY TREATED WITH ERGOT OF RYE.

By CHARLES NEATE, Esq., M.R.C.S. &amp; L.S.A.

THOMAS H—, aged sixty-two, labourer, has suffered of late years from severe catarrhal affections.

In the month of April last, after stripping off his clothes during a profuse perspiration, he states that he was suddenly taken with dimness of sight, weight, uneasiness, pain in the epigastrium, and griping of the bowels, immediately after which he vomited a large quantity of dark-coloured clotted blood; he was conveyed home, and I was sent for: this was on the 8th. Two or three hours had elapsed before I saw him, in the meantime he had vomited more blood, there was little or no fever present, pulse slow but hard, tongue furred, respiration short and embarrassed, the other symptoms much increased in severity. I ordered him acetate of lead in combination with opium every four hours, with a mixture of infusion of roses, necture of digitalis, and dilute sulphuric acid; a blister over

the epigastrium, cold and acid drinks, &c. On the following evening he became worse; had brought up more blood in the night; pain and gripings much aggravated; had passed two black motions. To discontinue medicines, and take a drachm and a half of tincture of sesquichloride of iron every four hours.

10th and 11th.—Better; has lost no more blood; expectoration sanguineous.

12th.—The blood has again returned; has vomited several ounces in the night. To discontinue medicine, and take a drachm and a half of oil of turpentine every four hours.

14th.—Much worse; passed a wretched night, and has brought up blood several times since the 12th; pain in epigastrium, anxiety; in short, all distressing symptoms have returned. I was now induced to try ergot of rye, and commenced by giving him a drachm and a half of the powder, divided into eight doses; one to be taken every four hours; and to omit the other medicines.

15th.—Better; has vomited no more blood since taking the second dose.

16th and 17th.—Very much improved; no return of blood, except in expectoration, which is rather sanguineous. To continue ergot.

20th.—All the distressing symptoms have entirely disappeared, and there is no tinge of blood whatever in expectoration; indeed, from this time he very rapidly convalesced, and, with the assistance of wine and nutritious diet, gradually recovered strength, and is now able to do light work.

*Remarks.*—Now, in this case, the ergot has shown itself as possessing considerable virtues, and evidently of an entirely specific nature. At any rate there is one recommendation to its use, that it is neither an excitant nor a stimulant.

Uttoreter, Staffordshire, July, 1854.

## A Mirror

OF THE PRACTICE OF  
MEDICINE AND SURGERY  
IN THE  
HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

## ST. MARY'S HOSPITAL.

CASE OF NON-MALIGNANT TUMOUR, OF CONSIDERABLE SIZE, SITUATED ON THE LATERAL PART OF THE NECK.

(Under the care of Mr. COULSON.)

AMONGST the admirable laws regulating the development of the animal economy, there is one on which physiologists have, perhaps, not dwelt as much as might have been expected—viz., the limits assigned to normal growths, as contrasted with the reckless and unrestricted increase of abnormal appendages. When once the maximum size of limbs, trunk, viscera, &c., has been attained, nutrition ministers to their continuance, and every portion of the frame retains a certain volume proportioned to the whole. But how differently are the various tumours circumstanced! They are unlimited as to size, and few of them are compatible with the healthful enjoyment of life, as they tend directly or indirectly to shorten existence. Some interfere with important functions, not exactly by their bulk, but by pressing upon organs the free play of which is indispensable to the maintenance of life; some produce the same effect after many years' growth, by dragging and irritating vital parts through their mere bulk or weight; some wear out the patient by pain; some exhaust his strength by profuse suppuration or by hæmorrhage; some seem to spare life, but render it miserable by depriving the sufferer of the use of one or more of the most important senses; and some, lastly, produce mere disfigurement at first, and slowly tend to destroy life by blocking up one of the canals of the economy, the patency of which is of primary necessity. An example of such a tumour has lately been offered at this hospital; it is mainly remarkable for its size, and for the moderate amount of inconvenience it has as yet produced:—

Edward T—, a carver, aged twenty-eight years, was admitted, under the care of Mr. Coulson, April 27th, 1854.

*History.*—Eight years before admission, the patient received

a blow from a man's fist, just in front of the left ear. This violence was followed, two months afterwards, by a painless swelling, of the size of a walnut, which, from his description, was probably subcutaneous, and very movable. The tumour gradually increased in bulk, although unattended with pain, and the second year it was about the size of a hen's egg. About the fourth year, it had proceeded both forwards on the face and downwards to the neck, and could be just grasped by the patient. At this time he went to the Margate Infirmary, where the tumour was opened in a depending part. A great deal of yellow matter escaped, and for seven or eight weeks there was a discharge of matter. The tumour, by this treatment, diminished in size, and the patient speaks as having derived great benefit in his health from his residence at the sea-side. At this time the swelling decreased to the size of a goose's egg; but a month afterwards, the patient having caught a severe cold, the tumour again began to increase, and in three months' time it had regained the size which it presented before it was opened. The development of the swelling was still unaccompanied with pain, but the man suffered much from earache and uneasiness in the forehead.

The swelling gradually became larger up to Christmas, 1853, (it being now of seven years' standing,) when it occupied the whole of the left side of the face, and had proceeded under the jaw of the same side. From the last-mentioned period to the man's admission (a lapse of about four months) the swelling has rapidly increased, and he supposes that during the time just mentioned, it has become nearly double in size, but he cannot assign any cause for this rapid increase, by which the tumour has extended to the opposite side under the jaw, and has mounted up on the face.

*Present state.*—The swelling now extends from the cartilage of the left ear to about midway between the jaw and the clavicle in the downward direction, and from the occiput to about half an inch from the commissure of the lips in the transverse direction; the most projecting part of the tumour being about three inches below the level of the chin, eight inches from the cartilage of the ear, and six inches to the left of the centre of the mouth. It extends from beneath the chin to nearly the level of the right zygoma; the lower maxilla is pushed to the same side, so that the two left incisor teeth of the lower jaw touch the first upper incisors. There is no hindrance to mastication, nor does the patient find one side of the mouth drier than the other, the flow of saliva through the left duct of Steno not being obstructed. The tumour is of a dusky hue, marked by a number of bloodvessels on its surface, and appears to be made up of a number of lobules. One very strongly-marked fissure passes from the left ear to the symphysis maxillæ. The tumour is soft, and gives the feeling of fluid beneath, which sensation is especially noticeable at the most projecting point, where pain of a shooting and lancinating character is experienced. The veins about the neck are much enlarged, and those on the forehead are also much swollen. At the posterior part of the sterno-mastoid muscle a second tumour is observed. The whole mass occasions some deafness, but it does not otherwise affect the man's health. The annexed engraving presents a faithful outline of the appearance of this gigantic growth:—

The principal tumour was punctured at its most projecting point, and a light straw-coloured fluid withdrawn, which, under the microscope, presented a few irregular-shaped bodies, composed of granular matter; but there did not appear any trace of anything like malignant cells. Attention was paid to his general health, and in a few weeks the swelling was punctured again, when arterial blood jetted out, but the bleeding was easily arrested.

After some months' stay in the hospital, the patient returned into the country, as the size and connexions of the tumour put any operative measures out of the question.

What is the nature of this tumour? Is it fibrous, with many vascular ramifications, the latter accounting for the arterial jet which followed the last puncture? Is the mass composed of enlarged lymphatic glands? Is it mainly formed of cysts? Is it a malignant growth? The latter supposition seems to be the least likely, from two circumstances: one is the length of time the tumour has been growing; the other, the negative evidence yielded by the microscope. We would not, however, attach much importance to the absence of malignant cells in the fluid removed by puncture, because it has been satisfactorily shown that this mode of investigation is defective. The fluid obtained may not have come from the actually malignant stratum of the tumour, or the part of it which possesses cancerous characters; and we cannot judge of the nature of the whole mass by the microscopic examination of a small amount of fluid discharged from a limited portion of the growth. The lancinating pains may be explained by the implication of nervous twigs, so that the tumour may, perhaps, be classed amongst those which are principally composed of the white bands characteristic of fibrous growths. These have been known to reach a very large size, and to follow upon violence offered to the soft or osseous portions of the frame. Still the cystic character may also be mentioned, as the swelling diminished in so marked a manner originally when it was opened at Margate. We shall acquaint our readers with the intimate nature of this large tumour when the opportunity for examining its internal structure shall occur. We may, in the meantime, refer to two cases of tumour of the neck, which were lately observed at St. George's Hospital. The connexions of these growths were also of such a kind as to preclude any attempt at removal; they were, after death, found to be of a malignant character. The notes were taken by Mr. Holmes, surgical registrar to the hospital.

#### ST. GEORGE'S HOSPITAL.

##### ENCEPHALOID DEPOSIT IN THE PAROTID AND CHAIN OF CERVICAL GLANDS.

(Under the care of Mr. HENRY CHARLES JOHNSON.)

GEORGE R—, aged sixty-four years, was admitted June 7th, 1854. The patient presented a swelling on the right side of the neck, the growth of which he had observed for about four months. The tumour was ill defined; it extruded from the jaw nearly to the clavicle, and presented, at its lower part, superficially, very obvious fluctuation; while above it seemed to be composed principally, if not entirely, of solid substance. The man's complexion was florid and healthy, his general condition appeared pretty good, and he was excessively fat. There was some difficulty of coming to a decided conclusion as to the connexions of the tumour, which appeared to go down upon the deeper structures of the neck, and to be movable, at least to some extent, independently of the jaw.

After the patient had been in the house a few days it was determined to puncture one of the spots in which fluctuation was most perceptible. A small incision was therefore made, and gave exit, not to pus, but to a glairy, serous fluid, which continued to ooze from the wound during the remainder of the time the man lived.

No distinct symptom was noticed during the first ten days of his stay in the house, but, on the evening of the eleventh, he was seized with a rigor and sickness, complained of headache, and could not sleep. Next morning, the headache and sickness remained as before, the patient was perfectly sensible in the early part of the day, but became rather delirious towards the evening, when some dyspnoea was also observed; this, however, was relieved by a mustard poultice. The sickness continued during the following day; he was very restless and unconscious of what passed around him; the faeces and urine escaped uncontrolled; the teeth were clenched; the patient had a distinct convulsive fit in the evening; and died in the night.

*Post-mortem examination, thirty-four hours after death, performed by Mr. GRAY, conservator to the museum.*—General appearance: Body well-formed, and a large quantity of fat in

the subcutaneous cellular tissue.—Cranium: The dura mater was more adherent to the bones than is natural; in other respects the membranes and substance of the brain were healthy.—Neck: On the right side of the neck, just below the body of the jaw, was a small aperture leading into a large aloughing cavity, full of offensive, purulent fluid, and implicating the margin of the parotid gland. On cutting into the latter, a small mass of encephaloid deposit was seen infiltrated into its tissue. The whole chain of the cervical glands on the right side of the neck was distended with a similar deposit, some of them being solid, whilst others were softened and broken down in their interior. Three cysts were also found on this side of the neck, one to the right of the thyroid gland, and two others above it, filled with a glairy, tenacious fluid. The glands on the left side were healthy. No malignant deposit was found, either in the chest or abdomen, the viscera being quite sound, excepting a certain amount of congestion.

**ENCEPHALOID TUMOUR DEVELOPED OVER AND IN THE PAROTID GLAND; DEATH; AUTOPSY.**

(Under the care of Mr. TATUM.)

W. C—, aged forty years, was admitted May 31st, 1854, on account of a swelling on the right side of the neck, which had been growing, according to his account, for about four months. It was difficult to make out the exact limits of the tumour, which seemed to extend from about the base of the jaw nearly to the root of the neck; the deeper parts of the tumour appeared to be solid and rather resisting; but superficial to this was a large quantity of fluid, which presented very distinct fluctuation a little above the thyroid cartilage on the right side.

The man's appearance was cachectic, but not remarkably so; he complained of weakness, and said that he had been falling away both in flesh and strength since the development of the disease, but had no other distinct ailment.

He was ordered good diet, bark, and iodide of potassium, and, as the disease was suspected to be malignant, it was thought better not to interfere too much with it.

A few days after admission, the skin at the most prominent fluctuating point gave way; on this opening being a little enlarged, a considerable quantity of bloody serum escaped, and continued to run through the wound during the remainder of the patient's life.

He was observed to get weaker for the next fortnight, and some wine was therefore allowed, although no distinct ailment could be made out. In a few days this weakness had so far increased, that the man took to his bed. On the twenty-fifth day, symptoms came on which were conjectured to arise from poisoned blood circulating through the brain—viz., frequent twitchings of the muscles of both lower and upper extremities, a semi-comatose condition, from which he could be roused only occasionally to answer questions, and low delirium. The pulse was very weak and frequent, and the bowels acted unconsciously. Diffusible stimulants and tonics were ordered, and he could swallow what was presented to him, but his condition never improved. The twitchings became more frequent and violent, amounting at length almost to convulsions. The man became listless and insensible, and, after lingering for three days, died exhausted, on the twenty-ninth day after admission.

*Post-mortem examination, performed, eighteen hours after death, by Mr. GRAY.*—Body well formed and very muscular. There was a small sloughy opening about the centre of the neck, of irregular form, leading into a large sloughy cavity, full of dark-coloured putrid pus, and extending beneath the centre of the sterno-mastoid muscle as high as the central portion of the parotid gland. The lower part of the gland was lying in the cavity, and was infiltrated with a plastic deposit, part probably of the tumour previously occupying this locality. At the back part of the sloughy recess were found lying the large cervical vessels, the common carotid and its bifurcation, and the external carotid, both covered with portions of the sloughing mass, but pervious throughout. Not so the internal jugular vein, for this vessel, for about two inches of its central part, had entirely sloughed away; the two ends of the vessel being blocked up by masses of lymph, as far as its junction with the subclavian vein. Some of the cervical glands on both sides of the neck contained masses of calcareous matter; on the right side others were filled with a soft pulpy substance of new formation, apparently a fibrinoid deposit, not malignant. No encephaloid growth was found in any of the splanchnic cavities, the viscera of which were in a tolerably healthy condition.

## Reviews and Notices of Books.

*Recherches Cliniques sur les Eaux Bonnes.* Par EDOUARD CAZENAVE, Docteur en Médecine de la Faculté de Paris, &c. 8vo. pp. 105.

THAT there is "nothing like leather" holds good with relation to authors as well as defenders of besieged towns. Whether the object of the writer be to recommend a particular kind of medicine, or a particular locality for the cure of disease, he fails not to give it his unqualified praise. Making allowance for much exaggeration, there is still a good deal of valuable matter in Dr. Cazenave's *brochure*, which contains an account of the physiological action of the Bonnes waters on the healthy, and of their therapeutical application to the diseased. Under the former head we are informed of a peculiar and specific power these waters are said to possess, in causing, after a few days' use, a state of active congestion of the cerian mucous membrane and fauces, with a sense of heat and constriction in the same parts. The circulation is quickened, and the digestive functions are performed with increased activity; the urinary and other secretions become more abundant, while at the same time the nervous system is much excited, with a degree of restlessness and sleeplessness, and the intellectual faculties become more active and exalted in their energies. These effects are very transient, and they leave the patient commonly in very improved health, particularly if there have been any chronic disorder of the air passages, such as aphonia, chronic bronchitis, asthma, incipient phthisis, &c.

The climate of the Eaux Bonnes must be very favourable to many of these pulmonary diseases, protected as this locality is from high winds by the elevated ridges of the Pyrenees, situated 790 metres above the level of the sea, it possesses a calm, soft atmosphere, with a remarkably steady temperature. The waters belong to the class of thermal hydrosulphurets alkaline. We subjoin the analysis of M. Ossian Henry:—

	Grains.
Azote	(traces)
Carbonic acid	0.0064
Hydrosulphuric acid	0.0055
Chloride of sodium	0.3423
magnesium	0.0034
potassium	(traces)
Sulphate of lime	0.1180
magnesia	0.0125
Carbonate of lime	0.0048
sulphur	(traces)
Silica and oxide of iron	0.0160
Matter, containing sulphur	0.1065
	0.6154

There is also sulphuret of sodium, and iodine and bromine have also been discovered.

*Female Physiology; a Treatise of the Diseases of Women, their Causes, Symptoms, and Means of Cure: with Hints on the Management of Health during Pregnancy and in the Lying in room, &c., forming a complete Ladies' Guide.* Illustrated with fifty engravings on steel. By THOMAS JAMES STURT, Doctor of Medicine of the University of London; Member of the Royal College of Surgeons, England; Licentiate of the Apothecaries' Hall; Associate of King's College, London; Accoucheur to the West London Lying-in Institution; Surgeon to the Dispensary for Consumption, Margaret-street; Fellow of the Medical and Microscopical Societies of London, &c. &c. London: James Gilbert, Paternoster-row, and of all Booksellers; also by post from the Author, 57, Margaret-street, Cavendish-square. Price 2s. 6d.; by post, 3s. 1854.

It has fallen to our lot to be obliged to review many absurd, and some indecent books, but we can safely assert, that we have never yet had to notice a more objectionable work, taken altogether, from the pen of a qualified practitioner, than the volume whose title page forms the heading of this article, and to which we beg particular attention. That the whole tendency of the work is obscene, must be apparent, when it is remem-

bered for whom the author writes; that it is trashy, the following quotation from the preface will prove:—"How wonderful are the changes which take place within and around us; mind influences mind, and matter acts on matter—the soul directs the material body—the body re-acts on the immaterial spirit—the two are linked in a manner inexplicable to our finite understanding, and the result is life. The child is father to the man, the mother is parent to the child, linked in a bond of union which death cannot sever."

We learn Dr. Sturt's reasons for writing in his expressed regrets that young ladies in their youth are at present debarred from all knowledge of the anatomy and physiology of the reproductive system. They hear, indeed, vaguely, of the sexual organs, but nothing positive is taught them. This want, this extraordinary deficiency in female education, our author undertakes to supply. Magnall's "Questions" forms a standard work of reference in Ladies' Colleges, why should not Sturt's "Female Physiology" be similarly employed. Just as fond parents trace the progress of their children's mental acquirements by harmless inquiries as to the situation and population of Denmark, so for the future our daughters may be able to return satisfactory replies as to the position and uses of the uterus, the causes of sterility, or the diagnosis and treatment of gonorrhœa. What! is it to be tolerated that a medical practitioner, a man above all others who should be imbued with true modesty, who of all men should help to preserve the young of both sexes innocent and undefiled in mind, that such a man shall unblushingly give to the ladies of England, drawings of the vagina, uterus, various stages of labour, spermatozoa, &c.; shall put into their hands, familiar and obscene descriptions of things which they never should hear of; that such an one should advise our wives to forward specimens of the vaginal discharge between two plates of glass, in order that they may be informed, by return of post, whether they are suffering from leucorrhœa or gonorrhœa?

"A little of the discharge may be enclosed between two pieces of their window-glass, the size of a shilling, and forwarded by post for examination; the duration of the discharge, and some particulars of the symptoms should be enclosed."—p. 190.

The italics are our own, for we are unacquainted with any means by which six weeks can be enclosed in an envelope. The author's grammar and mode of spelling, however, are often such as would excite the surprise of a child eight years old.

We say advisedly, that such disgusting rubbish has never before been put into type; and we blush to think, indeed we feel deeply humiliated at knowing, that the author of it is a brother practitioner, and a Doctor of Medicine of the University of London. But we are unwilling to allow for one moment, that the concocter of this work has any good though mistaken object in contemplation. Dr. Sturt fears that those who read his book may be delicate, may be too bashful to consult him personally. He need entertain no such apprehension; for we will warrant that any woman who will so far forget herself, so far allow her curiosity to master her reason as to peruse "Female Physiology," after becoming acquainted with the nature of the work, will lose all sense of modesty by the time she arrives at the conclusion. The paragraph on the causes of sterility may be well taken as showing the author's style, and indicating his reasons for writing. After remarking that "one remedy, the utility of which is shown in the case of Hannah, the mother of Samuel, should be earnestly borne in mind,"—he enumerates the following as the chief causes:—

"Dysmenorrhœa, or difficult menstruation, when accompanied by the discharge of clots, or the appearance of pieces of skin; debility of the parts from the whites, and too frequent sexual intercourse, may cause it; but it must not be taken for granted in any instance that the blame depends on the female, unless some very evident reason exists. My advice in all such cases is to apply at an early period, simple means being then efficacious, whereas delay will generally cause harm. If from delicacy an interview be objected to, advice can always be obtained by letter."—p. 92.

Let us conclude, however. We have been nauseated with our task of perusing Dr. Sturt's offensive volume, with its Mawworm piety, and we now cast it into the waste-basket, as the only proper place for it, having but this consolation—that no one out of Holywell-street, with the exception of the author, will degrade himself by selling it. Is it possible that Mr. Gilbert will continue to be its publisher?

## Foreign Department.

### M. FLOURENS' NEW WORK.

M. FLOURENS has just written a new work, entitled, "History of the Discovery of the Circulation of the Blood." In presenting the book to the Academy of Sciences, of which the eminent author is perpetual secretary, he thus sketched its principal features:—"I pass successively in review in this book the discovery of the circulation of the blood, of the lacteals, of the receptum chyli, of the lymphatic vessels, &c. I follow the chain of facts from Eriastratus and Galen to Servetus, and from Servetus and Caisalpinus to Harvey; then from Harvey to Pecquet and Thomas Bartholin. One point in particular has fixed my attention,—namely, I have endeavoured to inquire into, and in some degree to arrange, the ideas of Galen respecting the circulation in the adult and fœtus, the formation of the blood, of the spirits, of innate heat, &c. I examine, in one chapter, the claims of Scarpa to the discovery of the circulation of the blood; and, in the other, Servetus' opinions on physiology—for the latter author, though of a peculiar turn of mind, may be looked upon as a man of genius. The book concludes with two chapters on Gui Patin, the most witty and obstinate opponent of modern ideas." From this simple account of contents it may easily be imagined of what great value the book must be, and how delightful its perusal will prove to men of science generally, backed as it is by the name of the distinguished author.

### PRURIGO FORMICANS OF THE VULVA AND THE ANUS.

We find the following "specific solution" recommended by M. RICHARD, of Soissons, in the *Revue de Thérapeutique Médico-Chirurgicale*:—"Take of sulphate of zinc and alum equal parts; reduce these salts to a coarse powder, and put them upon an earthen dish coated with oxide of lead; place the dish on a gentle fire, and leave it until the mixture no longer emits air-bubbles and is turned into a stony consistence. Take the dish from the fire, pound the petrous substance into a fine powder, and throw about half an ounce of it, in divided parts, at about a minute's interval (to avoid too powerful an effervescence), into a quart of boiling water; then filter through paper, and keep the lotion for use. Every morning apply some of this solution with a fine sponge on the affected part; then, if it be the anal orifice which is suffering from prurigo, soak a piece of linen folded square (a little better than an inch to each side), and introduce one of the angles into the orifice. The mode of dressing is the same for the vulva. This lotion is also extremely useful for various kinds of eruption, but in the latter cases internal medicines should also be taken; these should principally consist of alkalies, bitters, and purgatives.

### NEW MODE OF ADMINISTERING COD-LIVER OIL.

Take the yolk of one egg; sugar, two ounces; orange-flower water, one ounce; cod-liver oil, three ounces; essence of bitter almonds, one drop. Either the sixth or eighth part will be a dose, according to the quantity of oil which is intended for the patient.—*Annales Cliniques de Montpellier*.

### CURE OF AN ANEURISM BY INJECTING INTO THE SAC THE ACETATE OF THE PEROXYDE OF IRON.

Dr. PAVESI, of Bergamo, has lately injected a strong solution of the above-named salt into an aneurism of the temporal artery affecting a young man. The sac was about one inch from above downwards, eight lines transversely, and might contain a drachm of fluid. A puncture was made into the tumour, and bright arterial blood escaped; the glass-pipe of one of Charrière's syringes was then introduced, and about sixteen drops of the solution thrown in. The tumour was ten minutes afterwards quite solid, and in one month no trace of the aneurismal tumour was left.

# THE LANCET.

LONDON: SATURDAY, AUGUST 5, 1854.

SINCE the memorable exposure of the anomalous condition of the Lunacy Laws, brought to light at the Commission on the late much-persecuted Mrs. CUMMING, no case has occurred of equal importance to that of Captain CHILDE. The case of Mrs. CUMMING is believed to have been the immediate cause which led to the revision of the Lunacy Laws last session. How far that revision led to amendment, we pointed out at the time when the new Bills were under the consideration of Parliament. We compared the measures proposed with the previously-existing laws, and expressed a very decided opinion that the new Bills were drawn up in the same narrow spirit that reigned throughout the laws it was professed to amend; and we foretold that abuses, similar to those which had been perpetrated under the sanction of the old laws, would continue to disgrace the new. The case of Captain CHILDE is the practical commentary upon our observations. The history of this gentleman shows, in the clearest manner, that that security for personal freedom, which this country boasts of as its peculiar privilege, if it really exist, exists not for those against whom insanity is imputed. To the man under this terrible accusation all protection is denied; he may be incarcerated without trial by jury; he may be kept in the most galling and soul-destroying confinement for years, even for life, without the opportunity of any public and open investigation into the justice of his detention; he may appeal to the *Habeas Corpus* Act for relief, but that famous palladium of British liberties has no remedy for his wrongs.

Let us briefly trace the melancholy history of Captain CHILDE. This gentleman was born in the year 1811, and entered the army at the age of eighteen. Endowed with considerable personal attractions, gifted with singular mental accomplishments, and placed by his fortune and family connexions in a position to gratify his every wish, it is not surprising that Captain CHILDE soon became a man of some mark in fashionable society. His vanity—a passion that in none of us wants the aliment of external adulation—was fed and pampered to the utmost. In the year 1838 he became impressed with the conviction that the Queen was personally attached to him. This conviction, improbable enough, and however apparently absurd, not necessarily nor in itself evidence of insanity, was still more deeply rooted, in a mind weak as to self-esteem, by the silly congratulations of his companions. His romantic passion was declared in a flood of letters addressed to the Queen. So strongly did this unhappy delusion possess his mind, that the Queen's marriage did not dispel it. He believed the marriage to be a "sham" and a "blind," to disguise the real sentiments of the Queen. Such conduct could not pass unnoticed. The authorities at the Horse Guards and the Home Office seem, in the first instance, to have treated him with kindness and consideration. Refusing to leave town, Captain CHILDE was subjected to a medical examination. He was reported to be labouring under delusions, and he was persuaded to go to Staffordshire, where he recovered so rapidly that he was enabled to rejoin his regiment. It does not appear that after this time he gave any evidence that

his old delusion influenced his conduct. At any rate he wrote no more letters to the Queen. But he had now a grievous complaint against the authorities. He insisted upon having his letters returned. His applications on this subject to Lord FITZROY SOMERSET became so urgent, and even violent, that Lord NORMANBY directed another medical examination. In consequence of this, he was seized at his hotel, and confined for six weeks in a private asylum kept by Dr. MONRO. When liberated, he went to reside for a short time at Leamington. He now complained bitterly, in addition to his former grievance, that the imputation of insanity had been unjustly fixed upon him. He again wrote angry letters to Lord FITZROY SOMERSET. He rejoined his regiment in Dublin, and, according to the report of his commanding officer, performed his duties in an "exemplary manner" for some months. Throughout this time, his offensive letters to the Horse Guards were continued. But it does not appear that he ever again committed any act which showed that his former delusion regarding the Queen exercised any control over his conduct. Lord FITZROY SOMERSET, however, moved, as it seems, by the letters addressed to himself, directed that Captain CHILDE should be examined before a medical board. This board came to the conclusion that he was of unsound mind; and—strange anomaly—he was removed to a private asylum kept by a member of that board: he became the profitable prisoner of one of his judges! In this asylum he remained for twelve years. He was visited from time to time by physicians, chiefly those who had formed the medical board, who always reported that he was still labouring under delusions regarding the Queen. On one occasion, however, Sir PHILIP CRAMPTON was deputed to see him. The opinion of this eminent surgeon is reported to have been to the effect that Captain CHILDE ought to be liberated. Now we desire to arrest particular attention to the position of those who still kept Captain CHILDE in confinement at this time. Throughout the whole period of his confinement, Captain CHILDE had never ceased to complain bitterly that he was detained in a lunatic on insufficient grounds, and to demand a trial by jury. His complaint was unheeded—his just demand systematically evaded. Were the authorities, and his father, who acted in concert with the authorities, so firmly persuaded of his insanity that they deemed a compliance with his request unnecessary? If such were their conviction, and we will not doubt their sincerity, can any conviction, however strong, justify their denial to Captain CHILDE of that which was his undoubted right? And might not their conviction of his insanity have been reasonably shaken by the independent testimony of Sir PHILIP CRAMPTON, who had declared that Captain CHILDE ought to be liberated? At this period of his incarceration, there exists a strong presumption, independent of Sir PHILIP CRAMPTON's evidence, that Captain CHILDE had really recovered from his delusion. His mind, indeed, was irritated by the sense of injustice, and at times depressed with the feeling of hope deferred. But we have no hesitation in stating our opinion, formed upon an intimate acquaintance with the case, and the consideration of the evidence adduced as to his state of mind at this time, that no sufficient reason for his further confinement existed. But, howsoever other persons may differ from us upon this point, we apprehend that no right-thinking or unprejudiced man will dispute that Captain CHILDE was fully entitled to have the question of his sanity tried before a jury.

Shortly after this occurrence, through the intervention and advice of two Members of Parliament, who, after seeing Captain CHILDE, had formed a strong opinion that he was of sound mind, he was, in October, 1851, removed to Hayes-park Asylum, near London. In this place he came under the jurisdiction of the Board of Commissioners in Lunacy. He was specially visited by them, and on two different occasions reports were drawn up. The tenor of these reports is somewhat remarkable. They will not bear too critical an analysis; nor, indeed, are they proof against the keen sarcasm and logical acuteness of the alleged lunatic who was the subject of them. It was stated that Captain CHILDE was still of unsound mind, but it was recommended that he should not be kept in confinement, and that he should travel under the care of a physician, to be nominated by his father. This proposition Captain CHILDE resolutely declined. He still persisted in his demand for a trial by jury, or for unconditional liberation. And surely the qualified terms of the Commissioners' reports ought again to have been admitted as a just and reasonable ground for complying with that demand. He had been immured as a lunatic for twelve years. He had no hope of relief from medical certificates. Sir PHILIP CRAMPTON's opinion, that he ought to be liberated, had been disregarded. He had appealed to the Commissioners, who, as Mr. BARLOW very truly observed at the Commission subsequently held, have the power of discharging persons detained as lunatics, who have, in their opinion, recovered. But Captain CHILDE well knew that he had nothing to hope from them. Firstly, they had decided against him; secondly, he was detained virtually under the authority of the Secretary of State, an authority superior to that of the Commissioners; thirdly, the Commissioners had never been known to exercise in a direct manner their power of liberation. Every other outlet closed, what remained but a jury for the unfortunate prisoner? To this end, therefore, he earnestly and unceasingly bent his attention. After many obstacles had been placed in his way, he put himself in communication with the Alleged Lunatics' Friend Society. It was the opinion of the representatives of that Society that he was illegally detained. Captain CHILDE was confined in England upon medical certificates issued in Ireland,—that is, beyond the jurisdiction of the English Lunacy Laws. Founded upon this circumstance, and the statement of at least one physician that he had been unable to discover any clear evidence of insanity, an application was made for a writ of *habeas corpus*. The illegality of his confinement was clear. A rule *nisi* was granted. When the case was heard, the writ was withheld, not because Captain CHILDE was not fully entitled to it by law, but on what we cannot but describe as a technical quibble. It was ruled that the evidence that Captain CHILDE had authorized the application was insufficient, although it was palpable to every one that the solicitor was acting upon his precise and definite instructions. The Habeas Corpus Act, then, like everything else, had failed him. At last, after nearly fourteen years of imprisonment, a Commission was obtained. The evidence adduced has been reported at some length in the daily papers. We cannot in this place venture upon so much as a brief recapitulation; we will state, however, this much:—The only evidence which can be considered conclusive was derived from numerous letters written by Captain CHILDE in cypher, the key to which was only discovered immediately before his case was to come before the jury. We do not hesitate to express our conviction that, had these letters not been deciphered, however decided

the opinions of some of the witnesses as to his unsoundness of mind might have been, no jury could have been found to pronounce him insane. These cypher-letters, we admit, bear witness of the existence of a delusion regarding the Queen. They were addressed to the Commissioners in Lunacy and to Dr. DUNCAN, in Ireland. The Queen is addressed under the fictitious name of "SERAT." They contain much advice about the conduct of the war; threats that he would not be satisfied unless the Ministers were dismissed; and they appear to be written under the impression that, although directed to other persons, by some mysterious means they reached the Queen's hands. The explanations of Captain CHILDE as to these letters reveal a singular psychological phenomenon. He says he is as conscious of the absurdities they contain as any one; they were written merely to beguile the weariness of confinement; he wrote down everything that came into his head; they were not meant for the Queen's eye, or to be perused by any one. But the impartial investigator will find it impossible to reconcile his explanations with the tenor of the letters and his conduct in sending them. They bear then, we say, sufficient evidence that Captain CHILDE's mind is, indeed, oppressed by a delusion as to his influence over the Queen. But we contend, at the same time, that the parties who have for fourteen years sanctioned his confinement as a lunatic, denying him throughout that dreary period the only tribunal that could satisfy Captain CHILDE, are not entitled to appeal to this evidence as the justification for their conduct. A month ago that evidence did not exist.

We will examine the case more minutely still. It does not appear that any letters in cypher were posted by Captain CHILDE prior to January, 1853. It may be presumed therefore, that before that date his mind was not so dominated by his delusion as it has been since. How is this to be explained? We answer unreservedly, that confinement, solitude, the dejection arising from the consciousness that he was an outcast from the world—the world of society and the world of intellectual life—had thrown him back upon his own mental resources, had driven him to that last refuge, the fearful contemplation of one's self, from which the mightiest intellects have recoiled. Could an inquisitor, skilled in the refinements of mental torture, contrive anything so sure to work the ruin of the human mind, as to deprive a man of every external attraction, to withdraw from him all those occasions which, in human society, are ever prompting new thoughts, and keeping the mind from that dangerous brooding over the creations of his own imagination? Does the body find the exercise necessary for the preservation of physical health if confined in a narrow space? Shall the mind find fitting exercise, if confined within itself, without collision with other minds? We repeat then our conviction, that the evidence by which Captain CHILDE's insanity has been established, *has grown out of his confinement*. We believe we are authorised in stating that such is the opinion of Dr. FORBES WINSLOW, Dr. BARNES, Dr. TYLER SMITH, and Dr. BUCHANAN, who had been consulted in this case, but who were not called to give evidence before the Commission. These physicians were unable to testify to the absolute sanity of Captain CHILDE; but they were prepared to state that confinement in a lunatic asylum was not only unnecessary and unjust, but calculated to destroy the prospect of his recovery. Facts strongly confirm this opinion. Down to the beginning of 1853, Captain CHILDE had enjoyed a certain amount of freedom from restraint. He had been permitted to

walk abroad unattended. His bodily health was thus maintained, and his mind was acted upon by the wholesome influence of changing external objects. His imagination was not encouraged to indulge in its own morbid flights, ever springing from the same associations, but was led into new and healthy exertions by fresh suggestions from the outer world. This partial but beneficial liberty was withdrawn from him, not because it was shown to be in any way injurious to him, but because it is said he posted letters. From this time, thrown, as we have said, upon himself, his imagination ran riot in cypher, and there can be no doubt that his mind relapsed into some of its former errors. A recovery that might have been permanent was thus untimely frustrated.

Some of the views we have stated appear to have been shared by the jury. The manner in which they arrived at their verdict is sufficient to show that the case was not free from ambiguity. The usual form of verdict declares "that A. B. is of unsound mind, and unable to manage himself or his affairs." After a deliberation of three-quarters of an hour, the jury returned with a verdict, expressing that "Captain CHILDE is of unsound mind"—that is, only one of the two distinct propositions contained in the usual verdict. Directed to retire for the purpose of completing their verdict, they spent another half-hour in deliberation before they could declare their acquiescence in the second proposition, that Captain CHILDE was unable to manage himself and his affairs: and in this second portion of their task they appear to have been guided less by the existence of any distinct evidence of his incompetency—for such was certainly wanting—than by that sort of mental proclivity induced by their previous assent to the first term of the verdict. The second term seemed in some manner to follow, as having a necessary connexion with the first. The feeling of the jury was further strikingly manifested by the recommendation they appended to their verdict—that Captain CHILDE should be removed immediately from Hayes-park Asylum, and that he should in future be allowed every facility to communicate with the Lord Chancellor. The prospect of his entire recovery thus contemplated, we earnestly trust will be realized.

In the brief account of this most important medico-legal case, we do not pretend to have given an adequate history of its psychological features. We have been chiefly desirous on this occasion of drawing attention to that aspect which exhibits the strange anomalies and disgraceful abuses which still exist under the "amended" Lunacy Laws.

In the month of May of last year, an inquest was held at the Birmingham Borough Prison, on the body of a poor lad, fifteen years of age, who was led to commit suicide from the severity of the sufferings he underwent in the course of his punishment. It appeared, at the investigation, that the wretched prisoner—a simple, feeble lad, fifteen years of age, who had been committed for stealing four pounds of beef—instead of being placed on the old-fashioned treadmill was made to turn a crank, the movements required being somewhat similar to those employed in turning a common grindstone. This crank, which was connected with the water supply of the gaol, had to be turned ten thousand times daily, two thousand revolutions having to be made before breakfast, four thousand between breakfast and dinner, and four thousand betwixt dinner and supper. Supposing the task to be uncompleted, the boy was dieted on bread and water, and the

shortcomings added to the ensuing day's work. As may be supposed, this youth, known to be in a weak state of health, was frequently unable to finish his work, and he was punished accordingly. He was also found to be dirty in his cell, and therefore, in addition to bread and water diet and increased hard labour, he was not permitted to go to bed until an hour and a-half after the other prisoners. The result was that the boy hung himself. At the inquest, the Rev. Mr. SHERWIN, the prison chaplain, put the coroner and jury in possession of certain facts known to himself. The deceased, who "appeared a willing lad, but very weak," stated that the pangs of hunger which he suffered, together with the crank punishment, were greater than he could bear; and this led him (the chaplain) to remonstrate with the governor, but without avail. The jury found the usual verdict of "Suicide in a state of insanity." It may be mentioned that two other prisoners had attempted to commit suicide about the same time from the same cause—hunger; and an inquest on one successful case of self-murder had been held only three weeks previously.

Of course the facts thus brought to light necessarily led to further investigations. A commission was specially appointed by the Government to inquire into the whole proceedings, the members of which have just presented their report, in which they find the late governor, Lieutenant AUSTIN, and the surgeon, Mr. BLOUNT, guilty of acts not only illegal but grossly cruel. As these two men are about to be publicly prosecuted, we shall forbear, for the present, making further remarks upon their conduct. We cannot help expressing our surprise, however, that no explanation seems, as yet, to have been demanded from Mr. PERRY, the Medical Inspector of Prisons. Was it this gentleman's duty to discover and prevent abuses in the Birmingham Gaol, or is this prison exempt from his supervision? The occurrences to which we have alluded did not take place in a day; on the contrary, they were spread over some length of time. Moreover, if we remember rightly, similar illegal practices were discovered to be taking place at one other prison at least.

We this week publish a letter from the Committee of the Royal Maternity Charity, in which they set forth the decision they have come to respecting the charges brought against Dr. T. L. BLUNDELL, the senior physician. Whether or not the decision will be held to be satisfactory by the profession and the public, may well be questioned. It is indeed stated that the requisitionists "have failed to substantiate these charges." But we cannot help remembering that the conduct of Dr. T. L. BLUNDELL caused the indignant resignation of no less than seven of his colleagues, who felt that a due regard to their professional character left them no alternative but to take that step. We find it difficult to believe that seven gentlemen of the highest respectability should have decided on such a course, except upon strong grounds. From the statements of Mr. PYE SMITH and Dr. BURCHELL, contained in the letters those gentlemen addressed to us, (see THE LANCET, Feb. 4th and 11th, 1854,) it appears that they determined on resigning, because they found the Committee upheld, or even justified, Dr. BLUNDELL. Is the present Committee equally bent on ignoring their representations? Is the recent investigation admitted to have been impartial and thorough? Possibly the Committee attach no very great importance to what they regard as a mere professional difference. Some persons are slow to appreciate the

importance of respecting those observances which regulate the intercourse of professional men. If such be the case with the Committee of the Royal Maternity Charity, we venture to tell them that they will find it impossible to conduct the affairs of that Institution with efficiency and credit, whilst setting at defiance the sentiments of the medical profession.

How far the Committee is competent to decide upon questions relating to the medical treatment and safety of the poor, may be judged from the view they take of what constitutes medical skill. When we said, that "so long as the Governors adhere to the inhuman maxim that midwives are good enough for the poor, so long will they fail to meet with the approbation of the public," we used the word "inhuman" advisedly. By what other term can we designate that principle which declares that poor women shall be abandoned, in the dangers of parturition, to the care of persons whom, perhaps, not one of the Governors would trust in the case of his own wife?

As to the delusion entertained by the Committee, that their midwives are "educated," we beg leave to tell them that their own education quite unfits them to determine upon what is necessary to render a person competent to undertake the most responsible duties of medical practice. The judgment of the public has long since decided that the science and practice of Medicine are beyond the grasp of the mental and physical capacities of old women.

A MOMENTOUS fact has occurred: the Board of Health has ceased to exist. After exercising its functions for nearly six years, the House of Commons has pronounced it unworthy of further confidence. It was provided, in the Act of the 31st of August, 1848, under which the Board of Health was constituted, "that the said General Board of Health shall be continued only for five years next after the day of the passing of this Act, and thenceforth until the end of the then next session of Parliament, and no longer." We were never amongst the indiscriminate admirers or opposers of the Board of Health; but to reflect on the past is superfluous, except to draw lessons from it with regard to the future. Doubtless the interval between the present and next session of Parliament will be employed by the Government in devising a measure to take the place of the Act for promoting the Public Health of 1848. The questions involved are too extensive for us to enter upon at present; but we shall not fail to recur to the subject. Meanwhile, we beg to recall the attention of our readers to the valuable memoir of Dr. GLOVER, "On a System of Sanitary Police," published in THE LANCET of March 25th of this year. At the present time, when cholera is surrounding us, this decision of the House involves most serious considerations.

**THE THAMES MARSHES.**—The report of the Select Committee appointed to inquire into the condition of the Thames marshes, states, upon the authority of intelligent and eminent medical gentlemen, residing in the neighbourhood of the marshes on both sides of the Thames below London-bridge, that the diseases prevalent in those districts are highly indicative of malarious influence, ague and fever being very prevalent; and that the sickness and mortality are greatest in those localities which adjoin imperfectly-drained lands, and far exceed the usual average; and that ague and its allied disorders frequently extend to the high grounds in the vicinity. The mortality of Woolwich, particularly East Woolwich, is much higher than the average. Woolwich adjoins the Erith and Plumstead marshes, where the water is frequently dammed up, which increases the quantity of decaying vegetation and malaria, and the ague which the people suffer is distressing, and produces many complications of disease.

## THE ANALYTICAL SANITARY COMMISSION.

RECORDS OF THE RESULTS OF  
MICROSCOPICAL AND CHEMICAL ANALYSES  
OF THE  
SOLIDS AND FLUIDS  
CONSUMED BY ALL CLASSES OF THE PUBLIC.

### PORTER, AND ITS ADULTERATIONS.

THE London public are indebted for porter, their favourite beverage, to a brewer of the name of Harwood, who introduced it in the year 1730.

At this period it was probably not possessed of such distinct features as at present, as the drink in favour up to that time had been a mixture of ale and beer, sold at twopence per measure then in use. Porter being intended to supersede this mixture, no doubt at first resembled it in strength, flavour, and colour, and the present empyreumatic and strong bitter flavour, and the other characteristics which distinguish the porter of the present day, were the results of gradual experiment, and the growing favour with which the new compound was received. The popularity which porter has attained may be judged of when it is remembered, that until the last few years it had entirely excluded the manufacture of ales from the leading breweries in London; now, again, there is an apparent slight reaction in favour of ale; but this is hardly real, as the returns show that very nearly, if not quite as much porter is consumed as ever, in proportion to the increased population, while there is a greatly-increased consumption of ales in addition.

Porter and stout should be brewed of malt and hops only, and the colour, as well as flavour, should be due to these alone.

The colour of all malt liquors is dependent upon the degree of heat to which the malt has been subjected in the kiln, and upon the amount of ripeness the hops have attained before being stripped from the poles. Thus, for the pale bitter ales, the greatest care is necessary to prevent the husk of the malt from charring in the least, and to maintain the original straw colour of the barley; and in the selection of the hops, that they should be picked as soon as sufficiently ripe to keep, and that no single brown or withered leaf should be suffered to remain. The reverse of all this is the case with the malt and hops required for porter. The malt should be briskly dried, until the flower of the grain is of a light brown-colour, and crushes with a crisp friability between the teeth; the hops, also, should have hung in the autumn sun till they have attained a rich golden hue, and the seeds are perfectly developed. With all attention to these requirements, however, the beer brewed would still be far from the necessary colour and flavour, and to attain these the maltster is compelled to prepare malt in a peculiar manner. It must be remembered, nevertheless, that the strength of the porter is due almost entirely to the pale malt, as the other kinds have their saccharine properties so dried up and burnt as to render them nearly useless, except for colour and flavour, as before mentioned.

In addition to these distinctive properties of porter and stout, there is one other of still greater importance—the peculiarity of the fermentation. Up to the commencement of this last stage of the process of brewing, the manufacture of porter is conducted in exactly the same manner as that of ale, with the addition of the different flavouring malts before mentioned; but during the fermentation the great difference is effected, as all the sugar is converted into spirit, excepting only such portion as is required to preserve the beer from the acetous fermentation, which is less than in ale, by reason of the larger amount of hops used in proportion to the strength of the wort. The difference will be best appreciated by the following figures:—Good porter should weigh about twenty-two pounds

specific gravity above water per barrel of thirty-six gallons before the fermentation, and single X ale about the same, but after fermentation, the porter will be found to retain only five pounds weight per barrel, while the ale has seven. Thus, ordinary ale is more liable to derange the stomach, by reason of its greater sweetness, while porter is more heady in proportion to its strength, and soporific in its tendency from the strong infusion of hops in its composition.

It may be interesting to make a few remarks, succinct as possible, upon the preparation of malt and hops before they come into the brewers' hands; and upon isinglass, the only substance which should be used for fining beer. It may be well to observe, before doing this, that sugar is permitted by law to be used for brewing, and has been and will be consumed extensively whenever malt rises to a sufficiently high price to render it profitable: nevertheless, it is advisedly the dogma that "porter and stout (and indeed all malt liquors) should be brewed of malt and hops only," as was enunciated in the commencement of this paper; for beer brewed from sugar has greater tendency to the acetous fermentation than malt liquor, so that, setting aside the undoubted superiority of flavour in the latter, the risk, both pecuniary and otherwise, is too great to tempt the prudent man of business.

Malt is barley in which germination has been carried on to a certain extent, and then suddenly cut off by the application of heat, and the process is conducted as follows:—After steeping the barley in a cistern of water till well swollen, it is thrown in layers on the slate floors of the long malt-house, buildings well known; it then heats and germinates very quickly; it is not, however, allowed to rest, but is turned over from time to time, until every grain has been alike exposed to the air, and to such light as is permitted to enter, which is not great, as the growth would otherwise be forced too speedily; and the object to be attained is the conversion of the starch into sugar, which is known to be complete when what is called the acrospire has reached three parts of the way up the grain, particularly observable by a thickening in the back of the grains of barley.

When the grain has arrived at this condition, it is thrown into the kiln in a layer of about three inches in thickness, and while there constantly turned over. The kiln has a perforated bottom, through which the heated air from a small furnace of Welsh coal ascends. The briskness of the fire and the time of drying depend upon the colour required in the malt. The process is then complete, with the exception of screening away the "malt-dust,"—the dried roots of the embryo plant, technically so called, a very nutritious food for cattle, and which also does duty sometimes for ground coffee, Scotch snuff, and it is believed other things besides.

In the choice of malt, the brewer is guided by the growth of the acrospire, as, if it be not sufficiently developed, there is less saccharine matter in the grain than is requisite, and more gluten; and, if overgrown, the saccharine matter is absorbed by the progress of the germination.

Malt contains, besides saccharine matter, a substance called *diastase*, which, in the *maash tun*, by the action of hot water and agitation by machinery, converts a far greater portion of the already partially-converted starch into sugar than is present in the malt before immersion.

The pale malt thus manufactured is the base and strength of all malt liquors. It now remains to notice the other malts used for the purpose of flavouring and colouring stout and porter.

Amber malt, used in the proportion to pale malt of one-eighth part, differs merely in being dried rather faster than the ordinary kind, and by a hotter fire. The delicacy of the flavour of porter is much dependent upon this malt.

Brown or blown malt is of the usual colour externally, but internally it is charred a deep-brown colour. It is manufactured by being placed in the kiln in a layer of only one inch in thickness, and dried by a fierce fire of wood in a very short space of time. This malt, used in the proportion of one-half of the pale malt, is the source of the rich empyreumatic flavour of porter, and does much towards its colour; but this is finally effected by what is called patent malt, which is of a very dark-brown colour. This malt is pale malt, perfected in the kiln in the ordinary way, and then roasted in a similar manner to coffee, only on an infinitely larger scale. The colour of porter, as before mentioned, is principally due to this malt; but it is so powerful an agent, that no more than one-fiftieth part of it is used in proportion to the other malts. Mr. Walsley, of 24, New-road, Mile-end, is the principal

maker of these malts for porter. His are the best in quality, and many improvements in the manufacture are due to him.

Hops will next demand our attention; but to consider the kinds and cultivation of these fully would occupy more space than can be afforded.

Hops are a very delicate and precarious crop, affected greatly by the weather, and they also fall a prey to various kinds of blight, of which the most devastating are the fly, technically so-called, and the mould or rust. The former is the well-known green insect and black fly, that attack the rose plants at the same time as, and accompanied with, honey dew; and its ravages are so great, that three-fourths of the year's crops are sometimes sacrificed. The latter is a fungus which attacks the hop itself, and not only prevents its proper development, and thus destroys its preservative properties, but also communicates an unpleasant flavour to the beer. Like the vine, the hop loves the sun, and can scarcely have too much of it; it also resembles that plant in the soils and situations it most prefers—the sunny sides of sloping hills, and the well-cultivated soil of Kent, resting on the Kentish rag or iron-stone. The most choice hops are grown in East Kent, and the next in estimation, in mid-Kent. In ordinary seasons, the hops grown in Kent nearly suffice for all the malt liquors brewed in England; but in seasons like the last—a most disastrous one—foreign hops are much used. Hitherto, the hops grown in Belgium have been considered the best, and, in appearance, there is no doubt they are so, as the Belgian growers have taken great pains to imitate our mode of preparation and packing; but the Bavarian hops are really much finer in quality and flavour, and the aroma is more perfectly preserved by their method of preparation, which differs from ours.

Some few hops are imported from America, but though very powerful, they are so rank and peculiar in flavour, that, without great improvement in cultivation, they are never likely to be extensively adopted.

The preparation of hops is a very simple process, and may be related in but few words. The poles, with the hop-plants still hanging on them, are pulled from the ground, when the hops are picked, by women and children principally, to a great number of whom it affords a temporary employment; they are then dried on a kiln, somewhat resembling the malt kiln, but the heat is much less, and the floor of the kiln is made of hair-cloth. A small portion of sulphur is burned on the kiln-fire, for the purpose, in the first place, of preserving the hops—at least this is the plea, and there may be some truth in it, as the sulphur may destroy any insect remaining in the hops, but the great reason for the use of sulphur is its bleaching property, which renders the hops more sightly to the eye. After they have been thus dried and bleached they are packed, by presses, tightly into the bags, or pockets as they are called, to exclude the air. They are packed so tightly by the hydraulic press that they become sufficiently solid to be cut in blocks with a knife.

All English hops are prepared in this manner, and the Belgians, finding that the bleaching and packing have a great effect upon the eye, have followed our example; but the Bavarian growers still adhere to the custom of their ancestors, and it is to be hoped they will continue to do so, with increased attention to cultivation and packing, which will render their hops equal to the best English produce.

The mode in use in Bavaria is as follows:—When the hops are ripe the plant is cut off close to the ground, and the hops are left on the poles to dry in the sun. This method preserves the aroma entirely, and all the essential oil; the consequence is, that although they are packed loosely in bales, and look like withered leaves, they have more strength and flavour in proportion to their quality than the English hops. It is somewhat premature to speak of this method as regards the preservation of the hops compared with that followed in England, as the Bavarian hops are a recent importation; in our variable climate the process by which they are dried would be unsuitable; but this at least may be deduced from the comparison, that great care should be taken in the use of the sulphur that the flavour is not affected; and, also, that a very low degree of heat is advisable, as there is no doubt much of the essential oil flies off in the drying process.

Having now touched, though imperfectly and cursorily, upon malt and hops, a few words upon isinglass will complete the account of the materials used in the brewing of porter.

The best isinglass comes from Russia, but a very large supply from the Brazils; that used by brewers is the cartilage of the sturgeon and other fish. The brewer buys it as imported, in rough pieces, as also the dressings and pickings rejected in the preparation of the finer sorts of isinglass for the confectioner, &c. The "finings" for porter are thus prepared:—The isinglass is put

into some sour beer to dissolve, technically to cut, which takes place in different times, according to the kind of isinglass made use of.

A small portion of this solution is added to every cask of beer, and well mixed with it. It being lighter, it almost immediately ascends, and carries up with it much impurity, leaving the beer as clear as wine. It may, perhaps, be well to mention, that the brewer sends finings, prepared as above described, to each of the publicans he supplies, and they are, by them, added to the beer as may be found requisite.

For many of the preceding details respecting the different varieties of malt and hops, and their uses in the preparation of several kinds of porter and ale, we are indebted to Mr. Thomas Druce, of the old and highly respectable firm of Druce and Sons, Hans-town Brewery, Chelsea.

(To be continued.)

## Correspondence.

"Audi alteram partem."

### THE LATE INQUEST AND THE PROFESSION.

[LETTER FROM MR. WEEDON COOKE.]

To the Editor of THE LANCET.

SIR,—Would you permit me space in your journal to hold up to the admiration of the profession; and to record publicly my thanks to, the following eminent men, who most kindly and generously put aside their engagements and their duties to give me the benefit of their testimony at the late inquest. The protracted nature of the inquiry obliged me to ask their attendance on many occasions, and I have much cause to be grateful to them for always promptly answering my call. One and all of these excellent men would have spoken to the difficulties and accidents occurring in lithotomy; but their testimony, although most valuable, was finally not considered absolutely necessary by my counsel, Mr. Clarkson, and they were therefore not called, much to my regret.

The profession will, I am sure, rejoice with me that so much kindly feeling was shown by men who hold the highest places in our ranks, and who have consequently the largest opportunities of appreciating the difficulties and chances of a mishap in a serious operation. Their honourable names are—Mr. Fergusson, of King's College Hospital; Mr. Edward Cook, of Guy's Hospital; Mr. Erichsen, of University College Hospital; Mr. Alex. Ure, of St. Mary's Hospital; Mr. Solly, of St. Thomas's Hospital; Mr. Adams, of the London Hospital; and although Mr. Coulson, of St. Mary's Hospital, was called by the coroner, I feel that I am deeply indebted to him for the kindly and professional feeling he exhibited in the witness-box. Mr. Henry Smith also would have given valuable testimony. My friend, Mr. Obré, of Dorset-square, kindly attended to state a case of protracted operation, and some other old and valued friends, to whom I need not publicly allude, were present, and ready with valuable testimony had it been necessary to call them. Since the termination of the inquest, I have to be grateful for many most kind intimations from gentlemen unknown to me before, of their warm sympathy, and I am glad of this opportunity to publicly acknowledge my thanks. I can scarcely ask you to print a most kind letter from Mr. Fergusson, but will send a copy of it in case you should feel justified in giving space to it in your journal. I am sure if you do it will honour your pages, and gratify exceedingly

Your most obedient servant,

T. WEEDON COOKE.

Upper Berkeley-street, Portman-square, August, 1854.

[NOTE FROM MR. FERGUSSON TO MR. COOKE.]

COPY.

16, George-street, Hanover-square, July 24th, 1854.

MY DEAR SIR,—Now that this unhappy inquest has come to an end, I beg to offer anew my sympathy with you on the occasion, as throughout the whole investigation nothing more appeared against you than you yourself originally admitted, viz., that you had an unsuccessful operation for stone, having committed a blunder which has often occurred before in the hands of others both older and more experienced. The evidence on all other points clearly showed that you had acted with great kindness and attention to the poor child, both before and after the operation.

My own impression is, that you have been hardly dealt with under all the circumstances, and those who know you as I do, and who appreciate your gentlemanly bearing, and excellent surgical knowledge generally, will hope with me that no serious evil will ultimately arise out of this painful incident in your surgical career.

Believe me, my dear Sir, yours very faithfully,

T. Weedon Cooke, Esq.

WM. FERGUSSON.

[LETTER FROM MR. BEDINGFIELD, NEEDHAM-MARKET, SUFFOLK.]

To the Editor of THE LANCET.

SIR,—I admire equally with yourself the manly, straightforward, and ingenuous manner in which Mr. Weedon Cooke gave his evidence at the late miserable inquest upon the remains of Alfred Richardson. Callous indeed must the heart of that man be who could hear without emotion the self-accusing exclamation wrung from the tortured witness—"It was a sad mistake altogether."

The sad mistake or accident (for I think it will not be contended even by Mr. Skey that it was done by design) was in supposing that the staff had passed into the bladder at all. This is evident from the statements of all the parties, as well as from the post-mortem examination. The knife did not "slip from the groove," as imagined at the time by Mr. Cooke, but unfortunately passed along the groove between the bladder and the rectum; in fact, the staff ruptured the membranous part of the urethra, (which in a child is very small, thin, and delicate,) and passed between the bladder and the rectum.

This is not a very rare occurrence. Accidental circumstances, such as a spasmodic state of the urethra, in connexion with the small calibre and tenuity of its membranous portion, may give rise to it, even in the most skilful hands.

When the accident has occurred, it may be known, first, by the immobility of the staff itself; it appears to be, as it were, bound down; you cannot move it about with the facility with which it can be moved when it is in the cavity of the bladder; neither can you by any possibility make it strike *distinctly* upon the calculus. Thirdly, if pushed forwards, it will be found to rest upon the prominence of the sacrum, as it did in the present instance.

To prevent the possibility of this accident, the index of the left hand of the operator ought to be passed into the rectum, in order to direct the point of the staff as it is passing along the membranous part of the urethra into the bladder.

Not only have I read and heard of these cases, but I was present at a case precisely similar to Mr. Weedon Cooke's some forty years ago. It occurred at the Bristol Infirmary. The operating surgeon passed the staff through the membranous part of the urethra, between the bladder and the rectum. The nature of the accident was not detected; the boy remained about fifty minutes upon the table; he was then removed to his ward, and died two days after the operation. At a post-mortem examination, it was found that the bladder had not been opened. The stone was taken from it, and the poor boy was "quietly inured" without any one so much as dreaming of an inquest, or casting the slightest censure upon the operator or his assistant. All present regretted the unfortunate result, but had any one hinted at a public exposition of the circumstances, he would, I feel assured, have been treated with contempt, and his name branded with infamy.

Before I conclude, allow me to make one more observation. When the staff has been withdrawn, after the incision into the membranous part of the urethra, it is perfectly useless to endeavour to reintroduce it into the bladder through the natural passage. The attempt should be made by passing a straight director through the external wound, under the arch of the pubis, into the bladder.

I am, Sir, yours respectfully,

Longville-house, Needham-market, Suffolk,  
July 29th, 1854.

J. BEDINGFIELD.

[LETTER FROM MR. J. POWELL WILDING, MONTGOMERY.]

To the Editor of THE LANCET.

SIR,—I beg to enclose for publication in your next LANCET (if you think proper) the copy of a letter I have this day sent to the Association Journal.

At the same time I wish to express my deepest regret that a much traduced profession should be still more traduced by the editor of one of its own journals, deliberately stating "That the jury had apparently a clear course to follow, so far as the cause of death and the skill of the operators were concerned." A legal journalist might just as well say a lawyer ought to be prosecuted in a criminal court for losing a trial. For the sake

of our profession, I hope you will, for once in your life, step out of your beaten track, and issue a second edition of your last number gratuitously, and send a copy to every professional man in the kingdom, otherwise thousands will never see the coroner's splendid address to the jury.

I remain, Sir, your very obedient servant,

Montgomery, July 31st, 1864.

J. P. WILDING.

*To the Editor of the Medical Association Journal.*

"SIR.—I hope, as I am a member of the Medical Association, you will publish a short letter for me in our next journal, a copy of which I have sent to THE LANCET.

"I will not for one moment inquire your reasons for taking up the cause of Mr. Gay so strongly, nor will I at present make further remarks upon your conduct as editor than this:—However honest and well-intentioned it might have been, it has, in my opinion, more than anything, tended to promote dissension in the Association, and the profession at large.

"As regards your editorial remarks on the low moral tone given to the profession by certain publications, and that we (its members) must become contaminated by reading (I presume) THE LANCET, I beg to say that I have taken that journal for twenty years, that I still do so, and remain, I hope, uncontaminated. I think it is hard for us, possessing (I hesitate not to say) at least as much general knowledge and good feeling as any other professional body, to be taxed by you with not being capable of selecting our own literature.

"Now for the 'suppressed inquest.' The jury returned a verdict 'That the child, Alfred Richardson, died of inflammation, caused by an operation unskillfully performed by Mr. Thomas Weedon Cooke and Mr. Thomas Wakley, jun.'

"The jury had a right to return that or any other verdict they thought proper; but, Sir, had you the right (occupying the position you do, and in which you ought to hold up the honour and dignity of our much maligned profession)—had you the right, I say, to stab one of its members when down, by saying 'that the jury had apparently a clear course to follow, so far as the cause of death and the skill of the operators were concerned?' *Proh pudor!* Who in future will carry out the blessed command of our Saviour—'Go forth and heal the sick.' Mr. Cooke in this (his maiden) operation did not enter the bladder; so far he was unfortunate, not criminal. Coupled with the evidence of Mr. Coulson, to the effect that expert operators have failed to enter the bladder, and the testimony of the late Sir Astley Cooper, who had known twelve such cases, I think such an editorial remark ought not to have been made in a journal purporting to be the organ of provincial medical men.

"I have performed several of the capital operations—in fact, am compelled to do so whether I wish or not, as I reside more than twenty miles from a consulting surgeon—and if I cannot calculate upon our own medical journals to defend my professional character when assailed, I shall only be thrown back upon my own resources, and will willingly abide the consequences, and have no doubt the result will be as triumphant in my case as I am sure it will be in Mr. Cooke's.

"I remain, Sir, your obedient servant,

Montgomery, July 31st, 1864.

J. P. WILDING.

## NAVY MEDICAL OFFICERS.

THE WARNING VOICE!

*To the Editor of THE LANCET.*

SIR,—Alas! what degradation seems to hang over this branch of our profession. Not many years ago, we read in the public prints of an old assistant-surgeon in the Mediterranean taking poison to close a long and weary servitude; then of another who, goaded to desperation by ten years of a midshipman's mess, was found in a Portsmouth hotel with his throat cut; then another became an incurable lunatic. These, varied with continual dismissals of assistants for drunkenness—and within the last month it has reached the full surgeons, two of whom have been dismissed by a court-martial for intoxication, their characters ruined and blasted after many years of the best part of their lives spent in the navy.

Happy, happy system! Delude young professional men into the public service, insult and degrade them in every way, and when driven by disgust and despair to habits of intemperance, rain them for ever by a court-martial! I am informed by naval surgeons that such is the case of the two unfortunates lately dismissed; they were both, on their entry into the navy, young men of the highest respectability and the best attainments.

Mr. Brady has moved for certain Parliamentary returns of the naval medical officers. From what I can learn, if he moved

for a return of the assistant-surgeons of the navy who, within the last twenty years, have committed suicide, together with a list of the medical officers who have left the navy after reaching the rank of full surgeon within the same time, he would, by comparison with the same data from the army, produce some startling facts.

One would suppose, that when the Admiralty is so strict with their medical officers, they would also give them corresponding encouragement. Now, how do they show this? Compare the medical personnel of the two branches now employed. A naval friend has furnished me with the following comparison, which please to insert in columns opposite each other, to show the disparity, and then even "Brummagem" will be able to decide if it were creditable to apply for naval assistant-surgeons.

### The Army in Turkey.

One Inspector-General of Hospitals, receiving £700 per annum, with 20s. per diem allowances, and ranking with a full Colonel in the army.

Four Deputy-Inspectors of Hospitals, receiving from £520 to £550 per annum, with allowances of from 10s. to 20s. per diem, and ranking with a Lieutenant-Colonel in the army.

Fourteen Staff-Surgeons of the 1st Class, receiving each from £400 to £440 per annum, besides allowances, and ranking with a Major in the army, or a Deputy-Inspector of Hospitals in the Navy.

### PRIZE MONEY.

Surgeons of the 1st Class receive the same share as a Major in the army.  
All other Surgeons the same as Captains.  
Assistant-Surgeons the same as Lieutenants.

Navy Surgeons, old and young, receive the same as a Mate R.N.; relatively the same as an Assistant-Surgeon in the army.

### WIDOWS' PENSION.

Widow of Assistant-Surgeon in the army, £40 per annum, the same as the widow of a full Surgeon R.N.

Widow of a full Surgeon receives £40 per annum, the same as the widow of an Assistant-Surgeon in the army.

Add to this the average ten years in a midshipman's mess, and the list of inducements to enter the navy is complete. I see, by a contemporary journal, that the ships, instead of having extra assistants, as they should have, are absolutely on peace numbers. Put the two services on the same footing, and then it may be possible to command medical talent and skill of the first class for the navy, but not until then.

Thanking you for your untiring opposition to all abuses,

I remain, your old subscriber,

Manchester, July, 1864.

PATER FAMILIAS.

## HOSPITAL ABUSES.—THE ROYAL MANCHESTER INFIRMARY.

*To the Editor of THE LANCET.*

SIR,—Of all the questions calculated to engage the attention and call forth the active energies of the students thoroughly to investigate, perhaps that of the irregularities exhibited by heads of hospitals, in conducting the surgical department, will be found the most important, although, as far as my knowledge has gone, it is one respecting which the students have offered but comparatively little public opinion, and to which they have presented still less actual opposition. To what can this circumstance be attributable? Can we ascribe it to direct indolence of disposition? It is to be feared, indeed, that there might be assigned to a certain few a still more despicable reason. But, although it is not easy to account for the

inactivity of the students, as a body, in these momentous matters, so immediately affecting their own interests, we may, with more certainty, show the inevitable evils which are the result of it. There may, and in all probability will be, a *select few*, (to whom I have before alluded,) who, inclined by false notions of interest to follow blindfolded at the skirts of the hospital-surgeons, still pretend to think the objects of these charities have not been perverted; but I would beg all such to reflect upon the many precious hours they have idly passed, vainly waiting for a surgeon's arrival, and how many difficulties they have experienced in striving to collect a few facts of a case they have wished to investigate. It may be said by some, that much of the inconstancy of attendance on the part of the surgeon has originated from the carelessness of the students; but I deny that (at least, whilst I have known this hospital) this has in any degree been the case, and whoever has taken the trouble to make observations will confirm me in charging its origin to the neglect of the surgeons to attend at the appointed hour, by which the students have been kept loitering and grumbling about the wards; and what is the consequence? Why, that most of them after a sacrifice of much money, have hardly thought of visiting the hospital at all, and that themselves and the public have suffered, and still must suffer.

From these truths, may I not come to the painful conclusion that pupils have large sums of money extorted from them for contracts which are never fulfilled, and that they have no opportunity for improvement, but, on the contrary, everything to impede them in the progress of professional knowledge? And who that contemplates this for a moment but will be ready to exclaim, "it is time to escape from such evils." Is not our position in society in after-life entirely dependent upon our success in practice, and this likewise upon the extent of our knowledge, which last is proportionate to our advantages now?

Let it pass that we have borne with silent lips, insult and wrong. Let it pass that we have seen ourselves deprived of our privileges one by one, and, like Sheridan when he saw his house in flames, never attempted to wrest an atom of property from destruction, or to quench the devouring element. The existence of evils has now been proved, and of evils fraught with pernicious effects to us and to the world; and can we bear this sacrifice of our future comfort and of human life with apparent approval?

Past events have fully testified that nothing can be done on our part without the united exertions of many. Perchance a puny arm may now and then be raised in defence of the right, but it has only served those before whom it has been bared as a laughing-stock, or they have passed it by "as the idle wind which they regard not." The question then arises as to what would be the most speedy and effectual means of remedying the various and serious evils under which we are labouring.

Trusting that I am not encroaching on your valuable space, allow me to remain—Your humble servant,  
Manchester, July, 1854.

OBSERVER.

## THE ROYAL MATERNITY CHARITY.

To the Editor of THE LANCET.

SIR,—IN THE LANCET of the 17th of June is inserted a short notice of a special meeting of the governors of the Royal Maternity Charity, convened to consider the report of a sub-committee, respecting the medical staff of the Charity, &c.; and in reference to an amendment moved at that meeting, viz.—"That the report be referred back to the committee, to inquire into the charges made against the senior physician of this Charity, and report as to the expediency of the surgeons being paid by the Charity instead of by the physicians," it is merely stated that, "the motion for the adoption of the report was declared to be carried." Upon this the committee are desirous of observing, that the meeting was one of the largest known in the Charity for some years; that the "amendment" was supported by only four out of the large number present, viz.—by Mr. E. Pye Smith, Dr. Burchell, and Messrs. Bamford and Bailey; and that upon the "amendment" being lost, the original motion for the reception and adoption of the report was carried with only one dissident. The committee beg, then, to state, that in their opinion, the rejection of that amendment would quite exonerate them from instituting any inquiry into the charges therein referred to; but having subsequently received a letter, or requisition, signed by nine governors, calling upon the committee to investigate certain charges affecting Dr. Blundell's conduct in connexion with his office of senior physician to the Charity, and also a letter from Dr. Blundell, requesting the committee to undertake that investigation, the attendance of those gentlemen was invited by

letter, to a special meeting of the committee, held on the 17th ultimo for that purpose. At that meeting, only one of the nine requisitionists (viz.—Mr. Bamford) and Dr. Blundell attended, and in order to give a further opportunity for substantiating the charges, the meeting was adjourned to the 19th, and the result was, that after a full consideration of the matters submitted to them in respect to the complaint, the committee unanimously came to the following resolution, viz.—"That the requisitionists having failed to substantiate the charges against Dr. Blundell, the committee regret that they (the charges) should have been brought; and they record it as their opinion that Dr. Blundell, as senior physician to this Charity, is fully entitled to the continued confidence of the committee and of the governors generally of the Royal Maternity Charity."

The committee further feel themselves bound to advert to an article on the Royal Maternity Charity, in THE LANCET of the 24th of June, and to express their surprise and regret at its insertion; and in respect to the passage in the concluding paragraph, that "So long as they (the governors) adhere to the inhuman maxim, that midwives are good enough for the poor, so long will they fail to meet the approbation of the public," they will observe, that in their judgment the "efficient working" of the "system of relief" afforded to the patients of this Charity for nearly a century, is proved by the fact, that 400,000 women have, in the hour of child-birth, as well as before and after it, received the assistance of the Charity, and that a less mortality has ensued, in proportion to the number of cases, than under any other "system" adopted by any similar institution.

Upon this conviction, the committee have no hesitation in requesting the attention of the Editor to the following paragraph in the "Report" of the sub-committee, which was adopted by the governors at the general meeting in June last, viz.—

"As bearing upon the constitution of the medical staff of the Charity, the sub-committee earnestly recommend that the services of the midwives be continued; *educated as they are by one of the physicians of the Charity*, they form a class of *well-instructed matrons*, whose services are not only of great advantage to the Charity, but also in the neighbourhood in which they reside, there being always some married women who from choice, as well as others, independently of this Charity, who, upon pecuniary considerations, gladly resort to midwives for assistance; and the sub-committee find that midwives have from its foundation constituted a part of the Royal Maternity Charity, and in their opinion are a most valuable medium for carrying out its benevolent designs."

By order of the Committee,

JOHN SEABROOK, Secretary.

Little Knight-riding-street, Doctors'-commons,  
July 20th, 1854.

[LETTER FROM MR. BAMFORD.]

To the Editor of THE LANCET.

SIR,—I intend to give notice of the enclosed motion, in conformity with the rules of the institution, at the general meeting on Thursday. The Committee went into the inquiry so far as regarded the fact of Dr. T. L. Blundell having made the offer alluded to in the motion, unqualified and unconditionally; and they fully admitted that he had done so; but it was perfectly clear that they meant to burke the substance of the inquiry, and which I believe they have done.

I am, Sir, yours respectfully,

Aug. 2nd, 1854.

JAMES BAMFORD.

*Notice of Motion.*—That the several sums proposed to be given to the three physicians by the special committee appointed to inquire into the duties connected with their office, as represented to the general meeting, is excessive, and a violent invasion of the funds of the Charity, unmerited and undeserved by any services such officers render to the Charity. The best proof of such fact is that given by one of the present physicians, long connected with the Royal Maternity Charity—namely, Dr. T. L. Blundell, who voluntarily offered, in 1852, to the chairman of the committee, Mr. Norris, to undertake the whole professional duties and responsibility, and provide all necessary assistance, in behalf of the institution, for a salary of £100 per annum. It is therefore due to the welfare and respectability of the Charity that the committee and governors at large should reconsider the present arrangement and organization of the medical staff, and effect such alterations in reference thereto as shall place every officer under the direct control of the managing committee; and also that both physicians and surgeons shall be paid in proportion to the duties actually performed, the ratio of which hereafter to be determined and settled by the committee.

## ON THE USE OF EUPATORIUM VILLOSUM AND NERVOSUM IN THE TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—A gentleman holding an official position in Jamaica, who is a frequent correspondent with the Royal Dublin Society, and a liberal contributor to its museum of natural history and botanic garden, has, in his recent communications, called my attention to a remarkable and, I believe, novel addition to the remedies used in the treatment of cholera. I may premise that his statements are confirmed by a friend, also holding a high official station in the island. The following is quoted from his letter:—

"I have put up a box of the bitter bush, *Eupatorium*, for this packet; and, should an opportunity offer, I hope it will be tested, as I am satisfied it will be found a safe and sure remedy in cholera. I have given it, with remarkable success, in every stage of the disease, even after collapse, and have not heard of a single death when the remedy has been administered in time, and persevered in. It is used by making a strong decoction by boiling about two drachms in a pint of water, and giving a small teacupful, cold, every half-hour until the symptoms abate. In severe cases it is given alternately with the saline powders recommended by the Board of Health. In simple diarrhoea, one dose is generally found sufficient. The first dose often produces vomiting; in such cases repeat the dose immediately. It is certainly a wonderful remedy, and the effect of it sometimes appears to be magical. I have used two species of it, which appear to be *Eupatorium Villosum* and *E. Nervosum*. That used in St. Ann's is, I believe, the *E. Rigidum*. We have several species here, all of which appear to possess the same active properties, but those I have named appear the best. The box I have sent contains the two species I have used; they are very similar, except that one (which I think the best, *E. Nervosum*) is inodorous, and that the other possesses a strong fragrance, which we think to be *E. Villosum*. The *E. Odoratum* is also common here."

It is right to state that the writer of the foregoing is not in the medical profession; still his observations on this plant should not, on that account, be disregarded. We know that several of the *Eupatoria* possess very active properties. Some are emetic and purgative, as our native *E. Cannabinum*; while others are powerfully astringent, or even styptic, as the *Matico E. Glutinosum*. Probably, the *E. Nervosum* and *E. Villosum*, and others whose efficacy has thus been stated in cholera, are powerfully astringent, and on that account may have a decided effect in restraining the choleraic diarrhoea, and thus give time for using the other remedies for restoring the heat and vital powers, which, from the continued drain of the fluid part of the blood, would otherwise inevitably end fatally.

Not having as yet received the box, I am unable to give any account of the drug from actual inspection.

I am, Sir, your obedient servant,

WM. EDWARD STULO, M.B.,

Royal Dublin Society,  
Kildare-street,  
July, 1854.

Assistant-Secretary to the Royal Dublin Society  
Fellow and Registrar to the King's & Queen's  
College of Physicians.

## THE CHOLERA.

It becomes again our painful duty to record in a specific manner the increasing progress of malignant cholera, which is reappearing with considerable virulence in different parts of Great Britain, and in some cases assuming a character of great intensity and rapidity of symptoms. That we are partakers in the fatal influences of a simultaneously very widespread epidemic force, is clear from the ravages the disease is making in distant parts of the globe. We last week drew attention to its fatal effects at Barbadoes and the Mauritius, and now we may, *en passant*, remark, that a despatch from Genoa announces that, at Leghorn, Florence, and Naples, the disease is prevailing to a considerable extent; at the former city above 124 cases occurring in one day. Turin and its vicinity are as yet healthy.

In ENGLAND the disease has been very fatal in a colliery village called Trimdon, (in South Durham,) lying between the Ferryhill station of the York and Berwick railway and Hartle-

pool, during the past fortnight. Its outbreak was very sudden, and many of the cases are said to have occurred without any marked premonitory symptoms, and ended fatally very quickly. The principal portion of the village is situated on a hill, and is rather favourably placed for draining. The disease has been most fatal amongst the poorer and least prudent portion of the pitmen, though temperate, regular-living persons have fallen victims to it. On Sunday morning week, a Primitive Methodist local preacher conducted divine service in the chapel belonging to that denomination in the village; without any marked premonitory symptoms, he was seized with the disease at midnight, and was dead in four hours. There was one death on Monday, and the disease appears to be quite epidemic. Though surrounded by colliery villages, no cases have appeared in any of them but Trimdon, and it is thought, therefore, that the epidemic must have its origin in some unhealthy local condition not yet discovered. Great complaints have been made, arising out of the apparent negligence of the General Board of Health in London. Immediately upon the appearance of the cholera in a fatal form, Mr. Wood, the overseer of the colliery, wrote to the board, informing them of the circumstance. Down to Saturday night last no answer had been received to his communication. The cases had been attended to by Mr. Scott, the colliery surgeon; Mr. Gordon, his assistant; and Mr. Ruddock, the union surgeon. The colliery surgeons instituted a "house-to-house" visitation immediately on the appearance of the disease, and have continued it without intermission. The other parts of the county are reported to be healthy.

We regret to say that the cholera has also appeared in a virulent form, during the present week, in Canterbury; and that fatal cases have occurred at opposite points of the City. At Fulham, Kennington, Chelsea, Lambeth, Whetstone, Southwark, Limehouse, Stepney, and Romney, fatal instances have likewise been recorded.

The following account of its outbreak on board a troop-ship was received on Monday night by electric telegraph from Plymouth:—"The teak-built barque, *Lord Auckland*, which left Gravesend on the 25th ult., bound to Kurrachee, East Indies, having on board 186 men of the 10th, 24th, 60th, and 87th regiments, put into Plymouth this afternoon with twenty-seven ill of the cholera. One private of the 24th, and two of the 87th, have died since leaving. It was deemed advisable to bear up for this port on Friday evening. The *Lord Auckland* is an old ship, and the breaking out of the fatal disease is attributed in part to bad ventilation. The authorities here have sent a hulk into the Sound to receive the cholera patients; five are now dangerously ill."

In IRELAND the disease has also had its victims, as the *Belfast Banner*, of a few days back, states that twenty-four cases of cholera have occurred since that day week, and that the disease has assumed a very aggravated character, and proved unusually fatal. The home of the disease is, as hitherto, the ill-ventilated and filthy alleys of the town.

As regards SCOTLAND, we extract the following from the *Edinburgh Witness*:—"We have to announce the occurrence of two deaths from this disease in the course of last week, although we are happy to believe they may be considered sporadic. The parties were Mr. Livingstone, of Danube street, and a son of about four years of age. Mr. Livingstone had gone to attend the funeral of his mother in Wishaw, who had died of cholera. On his return home on Tuesday, he felt a little out of order, and took some medicine, but did not call in a medical man till Thursday, by which time all the symptoms of cholera had set in. He died on Friday morning. His boy took ill in the course of the week, and died on Saturday of the same disease."

According to the *Alloa Advertiser*, the pestilence has shown itself in Coalsnaughton, in the immediate vicinity of Alloa. Two cases occurred on Saturday week, and one on Monday, all three terminating fatally within less than twelve hours' illness.

An interesting question connected with the pathology of cholera is that of its relation to the lower animals. Contemporaneous with the prevalence of the disease in different districts and towns of India and Europe, certain partial or distinctly localized epizootics have been observed, and believed by many to be examples of cholera in the lower animals.\* But in reference to the majority of the examples which have been collected together of local epizootic disease, more or less coincident with and resembling cholera, the authority we have referred to below remarks, that it unfortunately happens that neither the symptoms nor the post-mortem appearances have been made the subject of accurate medical investigation. We

\* See an able paper on the subject, by Mr. Marshall, in the eleventh volume of the *British and Foreign Medical-Chirurgical Review*.

admit, then, with Mr. Marshall, that we should at once reject them as positive evidences of the effects of a cholera agent upon the animals concerned; and we would add, that a more accurate account should, for the future, be taken of any unusual amount of disease amongst the lower animals during the time cholera is prevalent. We are led particularly to these remarks from observing that the Scotch papers refer to an uncommon amount of disease continuing amongst the grouse, and of its spread to the young birds. According to the *Greenock Advertiser*, "in Perthshire, the young broods of grouse are suffering so much from a disease, which is supposed to be tape-worm, that in some districts there will be a total failure of young birds."

The more than warnings that are now prevailing of the fatality that will in all probability ensue before the summer has passed away from us, should be made use of by the profession and the public to their fullest available extent. By the former, no opportunity should be lost of at once impressing upon public boards and private individuals how materially a defective hygiene and "medical police" tend to the wide-spread development and increased malignancy of the disease, if not to its actual genesis. As to the latter point, some, we know, differ; as regards the former, none are at variance, and hence no obliquity of purpose, whether scientific, political, or economic, should be permitted to prevail in arresting for one moment the furtherance of all those great sanitary regulations, whether of general or individual reference, which tend to greatly mitigate, if not entirely to arrest, the terrors of a pestilence so fearful as cholera. By the public, whilst it assists to the utmost of its powers the endeavours of the medical practitioner in preventing the occurrence of the affection, care must be taken that it does not delay seeking that advice and curative attention which are so absolutely necessary on the very first occasion of a single symptom or precursor of the disease. Again and again have we said—and we here repeat it—in cholera there is nothing so dangerous as delay. One hour, or even less, may settle the destiny of a man, for that which, as a simple diarrhoea, was amenable to the resources of the healing art, may pass with irresistible rapidity into the forlorn condition of the stage of collapse, if unchecked by the early and thus useful interference of the medical practitioner.

Since the foregoing was written, we are glad to perceive that all the hospitals in London have prepared wards for the immediate reception of cholera patients.

## Parliamentary Intelligence.

### HOUSE OF LORDS.

TUESDAY, AUGUST 1ST.

#### MEDICAL GRADUATES (UNIVERSITY OF LONDON) BILL.

On the motion of Lord MONTAGUE, the House went into committee on this Bill.

The Duke of ARGYLL said, he should move the insertion of the Scotch universities into the Bill. He had received several communications from the professors of the great medical schools of Glasgow and Edinburgh, and he was assured that a large number of medical men in the English provinces had taken the Scotch degree, every one of whom was now practising in violation of the law, and was liable to penalties, although it was not easy to put the law in force against them. He wished to put these persons upon a legal footing, not as surgeons, apothecaries, or general practitioners, but as physicians in England. The University of Durham had been included in the Bill, and he could not, therefore, understand how the insertion of the Scotch and Irish Universities could injure the Bill in any degree.

The Marquis of LANSDOWNE wished to see some regular uniform standard of medical examination throughout the country, to the benefits of which all bodies and institutions might be admitted. The whole subject required consideration, but it would be unjust to deny to the University of London the privileges which its medical graduates had been led to expect were secured to them by their charter. He thought their lordships might safely pass the present Bill, if surgery and pharmacy were excluded from its application.

Lord CAMPBELL could not imagine that any objection could be made to the introduction of the great medical schools of Edinburgh and Glasgow into the present Bill.

Lord WYNFORD was not hostile to the present Bill, but objected to partial legislation on a subject of so much importance. What was wanted was, that every man who obtained the right to practise, should bring with him to the neighbourhood

in which he settled, some guarantee that he was a proper and safe practitioner. He recommended the Government to consider the general question during the recess, and to bring in a Bill next session dealing with the whole subject.

The Earl of GALLOWAY thought that enough had been said to show that it was desirable to postpone the first clause of the Bill, in order that the subject should be considered in all its branches.

The Earl of DERBY had not much directed his attention to the Bill, but from the conversation he had just heard, he was inclined to agree in the opinion that their lordships were hardly in a condition to legislate, and that it was not fitting they should legislate in the partial manner proposed by the Bill. The whole subject of the license to practise arising from degrees granted by universities was worthy of the consideration of the Government, and a partial measure ought not to be adopted without consideration. The measure had been introduced on the part of a private member, and he did not believe, so far as the University of Oxford was concerned, that the slightest jealousy would be entertained to granting the privilege of conferring degrees to other universities. In this case the noble duke came forward on behalf of the Scotch universities, and asked why the Scotch universities should not be put upon a footing of perfect equality with the English universities. The noble duke, however, omitted to consider that a portion of the clause would interfere with a measure of that nature.

The Duke of ARGYLL said, he proposed to strike out that portion of the clause.

The Earl of DERBY thought that in that case the whole character of the measure would be altered, and the new question would be introduced, whether the license to practise in England, Scotland, and Ireland, should not be co-extensive, and apply to each kingdom?

The Duke of ARGYLL observed, that there was no penalty whatever upon an English medical man practising in Scotland.

The Earl of DERBY confessed, that if they were to deal with the question at all, they ought to deal with it as a great question of medical reform on some established and avowed principle. They ought to be either prepared to legislate upon the question as a whole, or to introduce a measure which would not be opposed to any general legislation upon the subject hereafter. It appeared to him that a question, involving principles of so much importance to the community at large, ought to be a question taken up by the Government, and dealt with as a Government measure. He did not, however, intend to take the sense of the House in opposition to proceeding with this Bill, but if the noble lord on the cross benches, or any other noble lord, thought that he ought to divide the House upon the further progress of the Bill, he should feel it his duty to do so.

Lord MONTAGUE remarked, that though the Bill was originally brought forward as a private Bill, it had unquestionably been taken up by Government, and had been supported by every member of the Government.

Lord CAMPBELL thought there was no prospect of proceeding with a measure now which would be perfectly unobjectionable, and if a motion were made that the Bill be further considered that day three months, he would second it.

Lord WYNFORD said that without intending to act in any way hostile to the Bill, but desiring that a general measure should be introduced, he would move that the House go into committee that day three months.

Their lordships then divided:—

Content	...	...	...	...	17
Not content	...	...	...	...	15
Majority for going into committee	...	...	...	...	2

The Bill, with some amendments, then passed through committee.

#### THE BOARD OF HEALTH.

The Earl of SHAFTESBURY moved for certain papers connected with the Board of Health, and entered into some further explanations as to the constitution of that body.

#### THE BURIALS BEYOND THE METROPOLIS BILL

was read a third time and passed, after a statement by the Bishop of London as to the disgraceful way in which interments were often conducted in unconsecrated cemeteries.

### HOUSE OF COMMONS.

MONDAY, JULY 31ST.

#### BOARD OF HEALTH BILL.

Lord PALMERSTON moved the second reading of the Board of Health Bill, and in so doing called on the House to recollect

that the present Act of Parliament in relation to the General Board of Health would expire at the end of the session, and also that upon the existence of a Board of Health depended the moral, commercial, and local interests of millions of their fellow-countrymen. The cholera had lingered in this country for the last twelve months, and one of the most efficacious means of dealing with this formidable disease was by a house-to-house visitation. He therefore hoped Parliament would continue the Board of Health, amended, as it would be, by this Bill. He proposed that the Board should be under the control of the Secretary of State for the Home Department. As to the persons composing the present Board, they had all placed their appointments in his hands. He felt bound to state this, in justice to those gentlemen, because a very considerable amount of clamour and prejudice had been raised against them in the discharge of a very important and difficult duty.

LORD SEYMOUR opposed the second reading of the Bill; the Board of Health Act being on the point of expiring, this was a proper occasion for reviewing its operations. He did not deny that there ought to be a Board of Health Act, but the value of such an act must depend upon the manner in which it was administered. The Board had two powers entrusted to them, namely, to advise as to the best sanitary measures to be adopted, and secondly, to administer the existing law with justice and discretion. He was prepared to show that in neither of these cases had the present Board given satisfaction. The noble lord said that this Bill would not remedy the evil complained of, and he therefore moved as an amendment that the Bill be read a second time that day three months.

SIR B. HALL seconded the amendment.

M. MILNES opposed, and defended the Board of Health from the attacks made upon it by Lord Seymour.

MR. HENLEY contended that the Board had given dissatisfaction to the public, and supported the amendment.

LORD JOHN RUSSELL, believing that a Board of Health was admittedly necessary for the safety of the public, earnestly urged the House to adopt the limited proposal of the Government, in preference to that put forward by Lord Seymour, and leave it for next session to decide in what manner the Board should be permanently reconstituted.

MR. HEYWOOD stated that Mr. Chadwick's medical advisers had recommended him not to remain connected with the Board.

MR. HUME expressed his willingness to vote for the Bill if the Government promised that Mr. Chadwick should not be connected with the new Board.

LORD PALMERSTON reiterated his former statement, that all the members of the Board had placed their resignations in the hands of the Government, to be dealt with as they shall think fit; and the House had heard from Mr. Heywood that Mr. Chadwick's medical advisers had recommended him not to remain connected with the Board.

On a division, Lord Seymour's amendment was carried by a majority of 74 to 65. The Bill is consequently lost, and the Government subjected to another defeat.

#### EXCISE.

On the motion of Mr. BRIGHT, returns were ordered of the total cost of the chemical establishment of the Excise Department from the 5th of January, 1844, to the 5th of January, 1854, giving the number, the names, and salaries of such officers as had been specially selected for chemical education at University College; of the seizures made during the same period, by whom made, and the amount of penalties incurred; the amount recovered, and in what manner appropriated; and of the cases compromised, the amount of money paid, and the grounds on which a compromise was agreed to; distinguishing the trades of the several delinquents. The returns to include all monies paid to independent chemists employed by the Excise during the said period.

TUESDAY, AUGUST 1ST.

#### PUBLIC HEALTH ACT.

SIR W. MOLESWORTH moved for leave to bring in a Bill to make better provision for the administration of the laws relating to the public health. The Bill was framed, he said, in strict conformity with the opinions, views, and wishes expressed in the House, yesterday—namely, that there ought to be a department which should have the administration of the matters under the cognizance of the present Board of Health; that the Board, as now constituted, was not a good Board for the purpose; that there ought to be a person in that House directly responsible to Parliament for the administration of the law, and present to give explanations; and that the new department should not be a portion of the Home Office, but be constituted in the same

manner as the Poor Law Board. The Bill, therefore, proposed to give to the Board of Health the same constitution (with certain exceptions,) as the Poor Law Board, and a clause would be introduced to make compensation to one of the present members of the Board of Health—namely, Mr. Chadwick.

After a short conversation, in the course of which Lord JOHN RUSSELL said the Government would be ready next year to consent to an inquiry into the whole working of the Board of Health, leave was given to bring in the Bill.

## THE WAR:

### MEDICAL INTELLIGENCE.

THE SCOTS GREYS.—Assistant-surgeon Robert Augustin Chapple has gone on board the *Himalaya*, in charge of the Scots Greys, who, although they number 400, have no other medical officer. Upon reaching Turkey he will be permanently attached to the regiment.

TURKISH ACKNOWLEDGMENT OF MEDICAL SERVICES.—The Sultan has expressed his intention of honouring Dr. Sandwith, staff-surgeon to General Beaton, with a title.

HEALTH OF THE BALTIC FLEET.—Cholera is rapidly disappearing. The *Austerlitz* at one period had 150 cases on board. The *Majestic* went to sea to recruit the health of her crew. A very singular feature regarding the disease is, that the screw ships only have been attacked by the epidemic, the sailing-vessels escaping with impunity.

THE PERILS OF MEDICAL MEN IN WAR.—In the sanguinary affair during the late attack on the gabion battery, north bank of the Danube, Dr. O'Hogan who was standing close to Captain Parker, who was shot dead, had his clothes riddled with Minié bullets; and just before Captain Parker landed, the gallant officer ordered Dr. O'Hogan to throw the yoke-line, and turn the boat, which he accordingly did, and was the next moment affording medical assistance to his gallant commanding officer, but in vain, as the fatal bullet entered Captain Parker's heart. Mr. Sorbey and Dr. King had charge of the others who were wounded.

RUSSIAN WOUNDED.—Upwards of five thousand men of the Russian army of occupation in the Danubian provinces are in the hospitals of Ibraila. Scurvy has broken out to a considerable extent, and affects the troops greatly. The disease is said to have been brought on by unwholesome food, insufficient clothing, and the character of the locality where they have been so long encamped. Upwards of three hundred waggons, containing sick and wounded, passed through Galatz on the 2nd ult. from the entrenchments before Silistria.

The following news is derived from a letter dated Malta, July 21st:—"The cholera has broken out both at Gallipoli and the Dardanelles. Many of the French troops have died. The mail steamer *Egyptus*, which arrived here this morning, has had cases of cholera on her passage down, and has lost, amongst others, her surgeon, of that disease."

### SANITARY NOTICE.

THE following important notice to the citizens of London has just been drawn up by the Medical Officer of Health for the City of London, Mr. Simon, and was issued on Tuesday week, by order of the City Commissioners of Sewers:—

"The attention of the public is earnestly invited to the necessity of taking every care for the maintenance of cleanliness in all parts of their houses and premises, and especially for the frequent removal of all refuse matters, animal and vegetable.

"It is of the utmost importance to health that the air should be kept free from offensive smells; and it is therefore requested that in case of any nuisance, prompt information may be given at the Sewers Office, Guildhall, where the Inspectors of Nuisances attend daily at twelve o'clock.

"All complaints of public nuisance may be thus addressed; as also all complaints relating to defects of water supply, to neglect by dustmen and scavengers, or to any filthy or unwholesome conditions of houses and premises.

"By order of the Commissioners of Sewers of the City of London.

"(Signed) JOSEPH DAW, Principal Clerk."

"Sewers Office, Guildhall, July 25th, 1854."

APPOINTMENT.—Mr. Edward Canton has been elected Assistant-Surgeon to Charing-cross Hospital.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at the meeting of the Court of Examiners on the 28th ult. :—

HOWARD, CHARLES OLDROFT, York.

HYDE, JOHN MARTIN, Oxford.

JOHNSTON, CHARLES EDWARD, Hon. East India Company's Service.

LUCAS, ROBERT, Army.

MARSTON, JEFFERY ALLEN, Newcastle-on-Tyne.

MINES, THOMAS, Belfast.

PEARCE, RAVENHILL, Llangarrew-court, Herefordshire.

WRIGHT, SAMUEL, Cottenham, Cambridgeshire.

The following gentlemen were admitted Members on the 31st ult., being the last court this session :—

BEALE, ROBERT HENRY, Harleyford-place, Kennington.

COLEMAN, WILLIAM WARMAN, Hon. East India Company's Service, Bombay.

HAMILTON, JAMES ALEXANDER, Omagh, Tyrone.

KERSHAW, BENJAMIN, Rochdale.

MILNER, ANDREW, High Hartgate.

ROCH, SAMPSON, Youghal.

STEWART, WILLIAM, Cork.

TOWLE, HENRY, Leeds.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, July 27th, 1854.

DOLMAN, ARTHUR HENRY, Melbourne, Derby.

HARDING, JOSEPH JAMES, Newcastle-on-Tyne.

RUSSELL, DAVID, Preston.

WRENCH, EDWARD MASON, Cornhill.

**UNIVERSITY OF GLASGOW.**—The following gentlemen obtained the degree of M.D. from this university at the summer examinations :—

FERGUSON, WM. EDWARD L., England.

GAMMILL, JAMES, Glasgow.

GRUNLUS, J. Glasgow.

HAMILTON, JOHN TRAVIS, Ireland.

HOUSTON, J., Scotland.

MC ADAM, J., Glasgow.

SMITH, WM. C., Loch Winnoch.

STEWART, WM., Glasgow.

WEIR, JOHN, Ireland.

YOUNG, JAMES, Norwich.

**CHARING-CROSS HOSPITAL.**—The annual distribution of prizes to the students most distinguished for their acquirements in the various classes of medical instruction during the past winter and summer sessions, took place in the board-room of the above hospital on Saturday, the 29th ultimo. The Rev. Dr. Worthington presided, who delivered an appropriate address to the company assembled, remarking upon the great progress which had of late years been made in medical science, and that the profession had become of increased importance now that we have a large army in the East, where the inhabitants were, by the laws of the Koran, forbidden the practice and study of anatomy. The several professors of the school offered some remarks introductory to the presentation of the prizes in the several classes; and all of them spoke in terms of the highest praise of the conduct of the pupils, their attention to their studies, and their general proficiency.—*General Proficiency:* Gold Medal, Mr. T. Simpson, Bishop's Stortford, Essex.—*Chemistry:* Silver Medal, Mr. C. F. Goldsbro', West-square, London; Certificate, Mr. G. Barnes, 6, Gower-street.—*Practical Chemistry:* 1st Certificate, Mr. J. Watts, Gerrard-street, Soho; 2nd Certificate, Mr. R. Biggs, Bath.—*Anatomy (Senior):* Silver Medal, Mr. E. J. Worth, Devonport; Certificate, Mr. J. M. Heward, South Lincolnshire.—*Anatomy (Junior):* Bronze Medal, Mr. J. W. Procter, West-square; Certificate, Mr. C. F. Goldsbro'.—*Medicine:* Bronze Medal, Mr. J. Watts; Certificate, Mr. J. M. Heward.—*Midwifery (Senior):* Silver Medal, Mr. J. Watts; Certificate, Mr. R. Biggs; Certificate, Mr. H. Holland, Godalming, Surrey; Book, Mr. E. J. Worth.—*Midwifery (Junior):* Bronze Medal, Mr. C. F. Goldsbro'; Certificate, Mr. J. W. Procter.—*Surgery (Senior):* Silver Medal, Mr. H. Holland; Book, Mr. J. Watts; Certificate, Mr. R. Biggs.—*Surgery (Junior):* Bronze Medal, Mr. C. F. Goldsbro';

Book, Mr. J. W. Procter; Certificate, Mr. G. Barnes.—*Physiology (Senior):* Silver Medal, Mr. J. Watts; Certificate, Mr. J. M. Heward.—*Physiology (Junior):* Bronze Medal, Mr. J. W. Procter; Certificate, Mr. C. F. Goldsbro'.—*Medical Jurisprudence:* Silver Medal, Mr. J. Watts; Certificate and Book, Mr. R. Biggs.—*Botany:* Silver Medal, Mr. C. F. Goldsbro'; Certificate, Mr. G. Barnes.—*Materia Medica:* Silver Medal, Mr. G. Barnes; Certificate, Mr. C. F. Goldsbro'.

**WESTMINSTER HOSPITAL SCHOOL OF MEDICINE.**—The annual distribution of prizes to the students of the above School took place on Thursday, the 27th ultimo, in the board-room of the hospital, and the following are the names of the successful competitors :—*Anatomy:* Prize, Mr. Wilson.—*Physiology:* Prize, Mr. Morgan.—*Surgery:* Prize, (Senior Class,) Mr. Legge; Certificate, (Junior Class,) Mr. Morgan.—*Dental Surgery:* Prize, Mr. Wallis.—*For Reports of Surgical Cases:* Prize, Mr. Wilson.—*Medicine:* Certificate, Mr. Wilson.—*Materia Medica:* Prize, Mr. Harris.—*Midwifery:* Prize, Mr. Morgan; 1st Certificate, (Jun. Class,) Mr. Harris; 2nd Certificate, Mr. Curran.—*Diseases of Women and Children:* Prize, Mr. Wilson.—*Forensic Medicine:* Prize, Mr. Morgan.—*Botany:* Prize, Mr. Harris.—*For General Proficiency,* (2nd Year's Students,) Prize, Mr. Morgan.—*For General Proficiency,* (1st Year's Students,) Prize, Mr. Harris.

**THE LATE DR. SPILLAN.**—We are glad to find that the notice which appeared in this journal relative to the lamented death of Dr. D. Spillan in a workhouse, and the great distress of his widow and children, has been responded to in the most liberal manner. Since writing the above we have ascertained that the distress of Mrs. Spillan has been increased by the death of a son in St. Giles' workhouse, from phthisis.

**THE AMICABLE MEDICAL SOCIETY.**—This society held its Annual Dinner at the Plough Tavern, Blackwall, on Thursday, the 13th ult., James Baker, Esq., in the chair. After the usual loyal and patriotic toasts and prosperity to the society had been disposed of, the chairman rose and said :—“The gentleman who had done them the honour of proposing prosperity to their society had stated that his was the toast of the day, but he begged leave to differ with him, for although no one could be more sincere than himself in wishing all success to their society, still he thought it was so much indebted for the way in which its affairs were conducted by their honorary secretary, that without his aid he doubted whether there would be a society at all; he therefore thought his must be considered the first toast, and he had much pleasure in proposing to them the health of Mr. G. W. H. Coward, the honorary secretary, who had discharged the duties of the office with so much credit to himself, and satisfaction to every member of the society, that a subscription had been entered into for the purpose of presenting him with some substantial token of their respect, and he had, upon the present occasion, the gratification of carrying their wishes into effect by offering for his acceptance this testimonial of their esteem.” (Here a massive and beautifully chased silver inkstand, with suitable inscription, and bearing Mr. Coward's crest, &c., was handed to him.) “He wished him and his family all the prosperity this world could afford, with health and long life to enjoy it.” Mr. Coward replied in a suitable address, and, after passing a convivial evening, the company separated.

**ESSEX AND HERTS BENEVOLENT MEDICAL SOCIETY.**—The Annual General Meeting of this excellent institution was held on Monday, the 17th ult., at the Brunswick Hotel, Blackwall. The chair was occupied by Mr. Gilson, of Halsted, during the business proceedings, and Sir John Forbes presided at the dinner. The society was instituted in the year 1786, and has been enabled, by liberal donations of members of the profession and the gentry of the two counties of Essex and Herts, to fund a sum of upwards of £8000, from the interest of which, and the annual subscriptions, they pay annually £337 to distressed members, and the windows and orphans of deceased members. Since the formation of the society, upwards of £20,000 has been expended in grants of this kind; and the amount granted in some years has exceeded £400. The subscriptions and donations have latterly decreased, owing to several energetic members of the society dying, and the younger members of the profession not taking so deep an interest in it. The business of the day, viz., the auditing of the accounts, the awarding of the sums to be paid to widows, &c., and other general affairs of the society having been transacted, the company sat down to a sumptuous dinner, and, after the cloth was removed, the chairman proposed “the Queen,” after which he gave the health of “Lord Viscount Maynard,” the president of the society, and a liberal subscriber to its funds. The next

toast was "Prosperity to the Essex and Herts Benevolent Society," when the chairman referred in eloquent terms to the usefulness of this and all other local institutions of a similar character, and remarked that it was the duty of all members of the profession, who have the means, to contribute according to their ability towards sustaining them in full activity. The chairman then proceeded to eulogise the more recently-established general societies, called the Medical Benevolent Fund and the Medical Benevolent College, and stated that it must not be supposed that these general societies militate against the interests of the local institutions, for it was unfortunately proved that the number of cases of extreme distress amongst the families of deceased medical men far exceeded the means placed at the disposal of the directors, and it was rather to be wished that every county in the kingdom possessed a local institution similar to the one whose foundation they were then met to commemorate. Several other toasts were drunk, including the health of Mr. Wormald, of St. Bartholomew's Hospital, and thanks to him for his donation to the society.

**THE CHOLERA IN AMERICA.**—The cholera has been very fatal in Canada, but is said to be now declining. It has spread into nearly all parts of the United States. The following is the account from Chicago on the 12th ult.:—"The cholera has been raging in this city with the greatest violence for the past two or three weeks, and people have been dying off like sheep. From the 3rd to the 9th of this month the deaths by cholera have averaged over 100 per day, and the carts conveying the dead to their last resting-place have been traversing the streets day and night for the last two weeks, some of them containing three and four bodies. A great many are buried before they have been dead half an hour. The emigrants appear to have suffered most. The number of deaths has been so great that the undertakers were unable to furnish coffins, and great numbers of the dead bodies were put in rough boxes, hastily constructed, and so buried. Indeed, it became so bad at one time that a great many were only wrapped up in the sheets on which they lay, or were buried in the clothes they had on them. As you may suppose, every one whose business has not kept him here has fled the city. The weather for the last two weeks has been the hottest—to continue for two weeks—that I have ever experienced. On Saturday there was a change in the weather, since which time it has been much cooler. With the change in the weather came a change in the cholera cases, and the number of deaths has considerably decreased."

**ABATEMENT OF INCOME-TAX ON LIVES ASSURED.**—On Monday, the 24th ult., an Act received the royal assent, to continue the Act of the last session of Parliament, for extending, for a limited time, the provisions portion of income-tax in respect of assurance on lives. The Act is continued until the 5th of July, 1855, and is applicable with respect to the double rate of 1s. 2d. in the pound.

**CITY SANITARY IMPROVEMENTS.**—From last Tuesday, all the offals from slaughter-houses in the City must, by order of the authorities, be removed between six P.M. and six A.M., under a penalty not exceeding forty shillings and not less than ten shillings.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, JULY 29.**—From 1008 in the preceding week, the deaths in London rose to 1219 in the week that ended last Saturday. In the ten weeks corresponding to last week of the years 1844-53, the average number was 1072, which, if raised in proportion to increase of population, becomes 1179. The present return is therefore in excess of the estimated amount. The zymotic class of diseases, which numbered 293 deaths in the previous week, rose last week to 422. The increase is caused by cholera, which has made considerable progress since the 26 deaths occurred which were announced in last report. It was fatal last week to 133 persons—namely, to 42 children under 15 years of age, 78 men and women between that age and 60 years, and to 13 persons 60 years old and upwards. Seventy-one, or more than half the number of cases, occurred on the south side of the river, 35 in the east districts, and the remainder in various other parts of the metropolis, as far as its western extremity. Diarrhoea increased from 53 to 84 in the last two weeks.

Last week, the births of 768 boys and 750 girls, in all 1518 children, were registered in London. In the nine corresponding weeks of the years 1845-53, the average number was 1361.

At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 29.990 in. The mean daily reading was above 30 in. on Sunday, Friday, and Saturday.

## Obituary.

Mr. GEORGE FREDERICK JONES, aged thirty-four, at his residence, 31, Edward's-terrace, Caledonian-road, Islington, on the 17th ult. The deceased gentleman destroyed himself, during an attack of delirium tremens, by swallowing nearly half-an-ounce of hydrocyanic acid in the presence of his wife. What is remarkable in the case is, that whilst his wife ran for medical assistance, after his informing her what he had done, he managed to walk up stairs to the second-floor landing, where he was found lying quite dead when the surgeon arrived.

At Belmont, Shrewsbury, on July 22nd, Mr. HENRY EDWARD BURD, Surgeon, aged sixty-four.

## BOOKS RECEIVED FOR REVIEW.

Mr. Edwin Lee's Notes on Spain, with a special account of Malaga and its Climate.

Mr. Edwin Lee on Nice and its Climate, with notices of the coasts from Marseilles to Genoa.

Dr. Henry Jeanneret's Vindication of a Colonial Magistrate from the aspersions of his Grace the Duke of Newcastle.

The Journal of Psychological Medicine and Mental Pathology. July, 1854.

Mr. James Paget's Lecture on the Importance of the Study of Physiology as a Branch of Education.

Mr. W. B. Hodgson's Lecture on the Study of Economic Science as a Branch of Education.

Mr. John Horsley on the Chemistry of Poisons.

Dr. Nottingham's Practical Observations on Conical Cornea.

Mr. E. J. Waring's Manual of Practical Therapeutics. Pharmaceutical Journal. August, 1853.

Mr. Francis Cooper on the Ventilation of Coal Mines.

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET Office 423, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

*The University of London (Medical Graduates) Bill.*—The Bill for conferring the promised equality with Oxford and Cambridge on the University of London is not, it seems, to be carried without formidable opposition. The triumph of justice and of free education will be all the more signal. In the House of Commons the representatives of the old monopolists were ignominiously beaten. In the House of Lords the contest was more closely drawn. On Tuesday last the Bill was carried through committee by a narrow majority of two, the numbers being—contents, 17; non-contents, 15. It is gratifying, however, to observe the uniform testimony borne by all parties to the high position the Medical Faculty of the metropolitan University has attained in the scientific world. Even Lord Derby admitted its superiority in this respect to the Universities of Oxford and Cambridge. He also stated that the concession of equality in civil privileges was regarded with no jealousy by the old Universities. Avowing these sentiments, it is a little surprising that he should oppose the only measure by which it is possible to give to the new University those privileges to which it is admitted to be entitled. In the House of Lords, the University of Durham has been struck out. The clause restricting the London Graduates from practising in Scotland has also been expunged. These alterations will bring the measure again before the House of Commons. Neither of the provisions referred to constitute an essential feature of the Bill. One was introduced by the friends of the University of Durham; the second was inserted to conciliate the Scotch Members in the Commons. By a strange perversity of policy the

Scotch Lords have struck it out. Let it be so. The conduct of the Scotch party, in making common cause with the bigoted monopolists of our old corporations in this contest, reflects as little credit upon their boasted liberality as upon their national discernment. Whatever be the fate of the Bill this session—and we still cherish the most confident expectations of success—the speedy installation of the University of London into all its rights and privileges is certain.

**A Voice from the Crystal Palace.**—A correspondent is astonished to find the bust of Frederick Carpenter Skey amongst those of the worthies in the Crystal Palace. The occasion for his astonishment is small. Not very far from the faultless surgeon is the bust of the arch-impostor, Hahnemann. If we were inclined to criticise the judgment or the taste of the directors, we might also refer to their omissions. But the vitreous nature of the dwelling selected for the effigy of the faultless surgeon might have suggested caution in throwing stones.

**A. B., (Manchester.)**—At the proper time the subject shall be noticed.

**Mr. H., (Finsbury.)**—A candidate for the appointment of assistant-surgeon in the Royal Navy has to undergo an examination before a board, consisting of Sir John Liddell, Sir John Richardson, and Dr. Bryson, at Sir W. Burnett's office. He has also to be examined at the College of Surgeons, and, if resident in Ireland or Scotland, at the Royal College of Surgeons of Edinburgh or Dublin; he has also to be examined at the College in London again on obtaining his promotion of full surgeon, whether he is a member of that College or not.

#### TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—As I perceive that occasionally there are accounts of the cholera breaking out in various places, particularly on board ship, permit me, through the medium of THE LANCET, to state to my medical brethren the practice I have invariably found to be successful in the first stages of this complaint. Presuming that, in a great majority of cases, some offending material is irritating the bowels, I have generally given from twelve to fifteen grains of rhubarb, with one grain of ipecacuanha, five of mercury with chalk, and, in some cases of severe cramp, about fifteen grains of aromatic powder. In all cases I have restricted the diet to farinaceous food, and have covered the abdomen with a mustard poultice, to which have been sometimes added a couple of drachms of tincture of cantharides. This plan of treatment has never once failed me, and I may add that the cases I have seen in which the opposite system, of giving brandy and opium, with large doses of calomel, has been pursued, have terminated fatally. In the last stage of cholera, ether and capsicum may be tried; but, in my opinion, aperiants, whatever may be the amount of purgation, are infinitely preferable in the first stage.

Your very obedient servant,

A SURGEON BOTH AFLOAT AND ASHORE.

July, 1854.

**Fiat Justitia.**—At present there is no Registration Bill before Parliament. It is probable that in the Medical Reform Bill, which is expected to be brought forward by Government next session, most of the anomalies which at present exist will be remedied. The one mentioned will, no doubt, be included in the list.

**Chirurgo.**—The suggestion shall not be neglected.

**Mr. Richard C. A. Hamilton.**—We have examined the specimens of patent prepared corium, or lamb-skin; they appear well adapted for the purposes intended.

**M.R.C.S. Eng.**—There is no such provision in the Act.

**A Subscriber.**—No difficulty can be experienced by any reasonable person in giving an answer in the negative.

**Chard.**—Alum acts as an astringent. As an external application it is quite harmless. It may be used in the proportion of a drachm to two quarts of water.

**A Friend.**—The statements were made at a public meeting, and ample opportunity was given for their contradiction, or for any questions to be put with a view of proving their correctness. If we are not mistaken, the writer of the letter was present; but whether or not, we have more important duties to perform than to answer such questions proceeding from such a quarter.

**An Enquirer.**—It is necessary that a "surgeon" to an emigrant ship should be "qualified." A law is in existence which prevents unqualified persons from taking the medical charge of emigrants.

**Justitia** must authenticate his letter, in confidence.

**An Old Subscriber.** (Sheffield).—There is "no law in England to prevent a licentiate of Apothecaries' Hall recovering a debt for surgical attendance." Retention of urine, requiring the use of the catheter, is a case in which an apothecary can recover for attendance.

**An Assistant.**—We regret to state that no such institution exists. The case is a hard one, but we fear by no means singular. There are one or two hospitals in London—the Charing-cross, for instance—at which there are free scholarships. "An Assistant" appears to be a person peculiarly fitted for the reception of such a bounty.

**F.R.C.S.** is thanked for his note. Will he allow us to attach his name to it? There is no occasion, of course, to mention the names of the surgeons to whom he alludes.

**Mr. J.'s** valuable communication shall be commenced in an early number.—To the last question, Yes.

**Dr. Sexton.**—The page is always bound up. The omission is caused by the odd number of pages of advertisements.

**A Suffering Working Man.** (Bath).—We have no recollection of any such paper. Careful search has been made in THE LANCET for the last four years, but without success.

THE trial of Aldrich and Harris v. Seaber shall appear next week.

**Poisoning with Potted-Meats.**—The Analytical Sanitary Commission of THE LANCET has repeatedly drawn the attention of the authorities and the public to the great caution which should be used in the various preparations of food, both preserved and otherwise, as so many of the ingredients were largely adulterated with foreign substances, or imperfectly manufactured. It is to be regretted that the Government does not acknowledge and act upon the necessity which exists for a proper supervision of every article of diet, from the humble "food" of the London mechanic to the more luxurious confections of continental artists. THE LANCET has created for itself no small amount of hostility and undying hatred by its exposure of the extensive and pernicious adulterations which have been found in almost every article of table consumption now vended by the licensed and unlicensed purveyors of the metropolis. This hatred and hostility on the part of dishonest adulterators has gloatingly sprung at every opportunity of displaying itself, and has, we have every reason to believe, even penetrated into that great citadel of justice—that "pure well of English undefiled"—a British jury-box, rather than forego the chance of revenge, which promised for the moment to repay its exposures. We will not further illustrate our meaning at present, but content ourselves by saying what has been said of old under similar circumstances, and will hold good to the end of time, "*Experientia docet.*" Without in any way averring that the foregoing remarks, beyond the caution with which we set out, apply to what we are about to draw public attention to, we reprint the following from the *Eastern Counties Herald* of a recent date:—

"On Saturday afternoon the inhabitants of Gibson-street, Foundry, were thrown into a fearful consternation by the report that six or seven families were poisoned with having eaten potted-meat, purchased at a shop at the corner of the street. About five o'clock in the afternoon, so alarmingly ill were those who had partaken of the meat, that Mr. Munroe, surgeon, was sent for, and found no fewer than twenty persons, comprising men, women, and children, all violently sick and purged, with severe cramps, and some of them, who had eaten more than the others, going fast into collapse. The whole neighbourhood was in great alarm, for it appeared that every one who had partaken of this meat was more or less affected. The police, whose exertions during the exciting time were exceedingly praiseworthy, at once stopped the sale of any more of the meat, which had been purchased of Mr. Andrews, a pork-butcher, in the shambles, who was also the maker. The same afternoon three or four cases of a similar nature occurred in Paradise-row, and the police at once stopped the sale of the meat, which had been obtained from the same source. On account of the alarming symptoms which some of the cases exhibited, the Mayor, on Monday morning, caused an investigation to be made in the magistrates' room as to the cause of the sudden and violent sickness. The meat-inspector deposed that potted flesh-meat, during very hot weather, will undergo a sort of putrefactive fermentation, which, even in that incipient stage, chemical analysis will not be able to detect, and will produce all those symptoms of gastric irritation and poisoning exhibited in those persons at the Foundry. He also thought that during the very hot weather, potted-meat, of the character of that sold, ought not to be taken, as it was almost impossible to judge of its soundness save by the effects produced. Some of the worst cases were those of children who had scarcely eaten more than an ounce of the meat. The Mayor showed the great danger to the public health by the sale of such meats during the hot weather, and remarked that similar cases occurred last year from the same cause. He recommended Mr. Andrews to cease making potted-meat during the hot weather—a request with which the latter stated he would be most happy to comply."

In addition to this, we had occasion last week to record the death of a girl through eating sweet-meats, which were coloured with some poisonous substance.

**A Student (Manchester)** will perceive a letter on the subject at page 111. Our correspondent's communication arrived too late for insertion in the present number.

**A. Y. Z.** deserves the initials. We will cheerfully adopt his valuable suggestion in the *BRITISH MEDICAL DIRECTORY* for the ensuing year. To his other inquiry, *Most certainly.*

**A Constant Subscriber.**—We know of no law to prevent a member of the College of Surgeons, only, holding such appointment.

**Enquirer.**—Dr. Beaman recommends that great quantities of common salt should be taken with the food, to prevent an attack of cholera. Dr. Beaman states that where this course has been adopted, the persons have never been attacked with the disease.

**J. M.**—We shall notice some portion connected with the case next week.

**Mr. W. H. Bellot.**—The fragments of tea forwarded consist of what is known as *lie tea*—that is, it is composed of tea dust, made up with sand and gum into little masses, which are afterwards faced, or black-leaded, in the usual manner. This is the work of Chinese adulterators.

COMMUNICATIONS, LETTERS, &c., have been received from — Mr. G. Lewis Cooper; Mr. Edwards, (Cheltenham); Mr. Tucker; Mr. James Bamford; Mr. Weedon Cooke; Mr. Everton; A Voice from the Crystal Palace; Mr. Beddingfield, (Needham-market, Suffolk); Mr. F. H. Harris, (Milden-hall, Suffolk); Mr. R. H. Bakewell, (Stafford); Mr. J. Parrish, (Kingswinford, with enclosure); Mr. E. A. Howard; Mr. J. Ody, (Market Harborough, with enclosure); Mr. J. E. Jennings, (Coleford, with enclosure); Mr. Burd, (Shrewsbury); A Student, (Manchester); J. M.; Dr. Furlong, (Antigua); Mr. J. P. Wilding, (Montgomery); M.R.C.S. Eng.; Mr. W. H. Hobkirk, (Charlotte Town, Prince Edward's Island); A Subscriber; Chard; J. F. W.; Amicus, (Aberdeen); Mr. E. Steele; M.B.; Charing-cross Hospital; Dr. Aston Lewis; Dr. M. J. Rac, (Carlisle); Mr. Masters, (Ilminster); Mr. Elliot; Dr. Sleete, (Dublin); Mr. Wieland; A Suffering Working Man, (Bath); Mr. Edwards; A Twenty Years' Reader; Dr. Sexton; A. B., (Manchester); A Foreigner; Mr. W. H. Bellot, (Stockport); Pater Familias; Fiat Justitia; Mr. R. C. Hamilton; Mr. C. Hogg; J. F. W.; F.R.C.S.; An Enquirer; An Old Subscriber; Justitia; Mr. H., (Finsbury); Chirurgo; A Friend; An Assistant; F.R.C.S.; A. Y. Z.; A Constant Subscriber; &c. &c.

**Hooper's Invalid Water Cushions and Mattresses, or Beds, for Bed-sores,** whether threatened with Sloughing, or in which Sloughing has actually taken place.—Fractures, Diseased Joints, Ulcerated Cartilages, Paralysis, Spinal Affections, Renal Diseases, Inflammation of the Bowels, Spasms, Lassitude, Typhoid and other Fevers, Gout and Rheumatic Affections, Cancer, Ovarian Dropsy, Coldness of the Stomach and Feet, Consumptive, and all Bed-ridden Patients. Mr. Hooper has succeeded in obtaining Waterproof Sheetings (Bed Protectors) at a Great Reduction in Price, Free from Smell, and not affected by Temperature, Urine, Acids, or Alkalies; and, MAY BE WASHED AS FAMILY LINEN. Also—

## IMPROVED URINALS, AND ELASTIC BED PANS, OR RECEPTACLES,

INDIA-RUBBER, ENEMA, and DOUCHE, answering equally for either purpose, and may be carried in the Pocket.

For Hospitals and other Institutions a Discount is allowed. Their advantages over the costly and cumbersome Water Beds have been published in the Medical Journals, and they are particularly applicable for Paralytic and Lunatic Patients.

"I HAVE in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water-Bed.

"JONN. PEREIRA, M.D.,  
"Physician to the London Hospital.  
"Finsbury-square,  
"February 27, 1852."

"North Wales Lunatic Asylum.

"Sir,  
"Your Water Cushions and Mattresses answer most admirably; indeed, they are invaluable. They have been in use here for eighteen months.

"Jan. 1854." "R. L. WILLIAMS, M.D., Visit. Phys.

INVALID CUSHION,  
FOR GENERAL PURPOSES.

CUSHION MORE ESPECIALLY USEFUL FOR SLOUGHING  
OVER THE SACRUM.

CIRCULAR CUSHION, FOR SITTING ON.

MATTRESS OF AN INTERMEDIATE SIZE.

FULL-LENGTH INVALID MATTRESS OR BED.

Being greatly preferable to the original costly and cumbersome Water Bed. The above are simply to be placed on an ordinary Bedstead.

## HOOPER'S SPIRAL SUPPORTERS.

[The Figures 1, 2, 3, &c., show the points at which measures should be taken in circumference.]

KNEE CAP.

SPIRAL SUPPORTER.

ABDOMINAL SUPPORTER.

ANKLE SOCK.

STOCKING.

HOOPER, 7, PALL MALL EAST, AND 55, GROSVENOR STREET, LONDON.

## GOLD CHAINS AND JEWELLERY.

**Watherston and Brogden, Wholesale Manufacturing Goldsmiths and JEWELLERS,** beg to announce to the Nobility, Gentry, and Public in general, that in obedience to the numerous calls made upon them since the Great Exhibition, where they were awarded a Prize Medal, they have resolved to throw open their Manufactory to the Public at Manufacturers' prices, a closer connexion than has hitherto existed between the real worker in the precious metals and the Public being obviously an advantage to both parties. Gold is capable of being alloyed to any extent, and therefore, in order to protect the Public in the article of Chains, Watherston and Brogden will make the Mint price of 77s. 10½d. per oz. for British standard the basis of all their operations, and, making their profit on the workmanship alone, will charge the bullion in their Chains at its intrinsic value, undertaking to re-purchase it at any time at the same price: thus—15 carat gold will be charged and will realize 53s. 1d. per oz.; 18 carat gold will be charged and will realize 63s. 8½d. per oz.; 22 carat gold will be charged the Mint price of 77s. 10½d. The price for workmanship will be charged according to the intricacy or simplicity of the pattern: for example—a Chain weighing 2 oz. of 15 carat gold is worth, at 53s. 1d. per oz., £5 6s. 2d. intrinsic value; supposing the workmanship to be £2, total £7 6s. 2d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a Gold Chain, and, being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of Jewellery, all made at their Manufactory, 16, HENRIETTA STREET, COVENT GARDEN. (Established 1798.)

**Cocoa-nut Fibre Matting and Mats,** of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 22, Ludgate-hill, London.

**Improved Invalid Cot Carriages—**the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

**Metcalf and Co.'s New Pattern** TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'s only establishment, 130 B and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

**Rice Harris and Son, Islington** GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES. These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroys the effluvia and smoke, which have hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham, and at Mr. JOHN SHORTER'S, Chapin-street, Spitalfields, London.

**Purification of Linen—Prevention of** DISEASE.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

J. BOILESSVE, Esq. SAMUEL HUBERT, Firm of JOHN WOOLLAWS and Co., Paper-stainers

**Warming and Ventilating, by Hot** AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

New Independent Chapel, Longsight, Manchester, January 10th, 1852.

SIR,—I am instructed by the building committee of the above Chapel to order one of your No. 3 Calorifere, for heating and ventilating the School in connexion therewith. As the sub-committee, upon examination of most of the public buildings, churches, and chapels in the town, find such general satisfaction with the existing apparatus and their imperfect heating and ventilation, they have examined your Calorifere as in operation, and believe it best adapted to meet their wants. It is intended, should it prove successful, to apply another apparatus to the chapel.

To J. Boilessve, Esq.

SAMUEL RIGBY, Secretary.

New Independent Chapel, Longsight, Manchester, April 12th, 1854.

DEAR SIR,—I am authorized to inform you that the No. 4 Calorifere, erected to warm the Longsight Independent Chapel, is in every respect satisfactory to the committee and the congregation.

Yours respectfully,

To J. Boilessve, Esq.

ROBERT RUMFEX, Chairman.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**For Hot or Wet Weather, Berdoe's**

LIGHT SUMMER COATS of superior description, at the lowest charges; also the well known Ventilating Waterproof Light Coats, Capes, Shooting-Jackets, Ladies' Mantles, Habits, &c., all effectually resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs. W. BERDOE, Tailor, 96, New Bond-street, and 69, Cornhill, (only.)

**To all who cannot get a Fit; the**

importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance. R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

**Novelty in Bedsteads, adapted for**

the Nursery, Sick Chamber, Sitting-room, and Drawing room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, matted complete, 35s.—the most complete article ever introduced to the public.—

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

**Railway Travellers, and all persons**

suffering from weakness, should obtain one of W. S. SPARKS'S newly-invented URINALS, for night and day use, for both male and female. They are made on the most approved principles, so as to prevent any unpleasantness, are very durable, and at prices within the reach of all. W. S. also manufactures all articles in india-rubber and gutta-percha for invalids, including bed-pans, sheeting, water and air cushions, pillows and mattresses, hearing-tubes, portable baths, elastic bandages, stockings, knee-caps, &c. &c. Water-beds on sale or hire. The medical profession, hospitals, and country dealers supplied on the best terms, and circulars, &c. forwarded on application.—W. S. SPARKS, India-rubber Manufacturer, 115, New Bond-street.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

**Important Saving, by Pre-payment,** in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSPLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

½ oz.	1 oz.	& 1½ oz.	per Gross, 6s.
2 oz.	"	"	7s.
3 oz.	"	"	8s.
4 oz.	"	"	10s.
6 oz.	"	"	15s.
8 oz.	"	"	18s.

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London.

No charge for Package.

Breakage at risk of Purchaser.

4½ oz. graduated in 3 doses 12s. 6d.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSPLEY PELLATT & CO., FALCON GLASS WORKS, LONDON.

## Caution!—Messrs. Allsopp and Sons

find it necessary to caution the Public, and especially Shippers of their Ales to the Colonies, against frauds committed by parties in selling spurious Ales for those of Messrs. ALLSOPP & SONS.

Messrs. ALLSOPP & SONS have felt compelled, by the extent to which this disgraceful practice has been carried, to proceed, in several cases, by obtaining Injunctions from the Court of Chancery; and have ultimately been driven to prosecute criminally, for the commission of this offence. They beg to call attention to the case of "THE QUEEN v. GRAY & GOSLIN," in which Lord Campbell sentenced the parties charged to TWELVE MONTHS' IMPRISONMENT WITH HARD LABOUR.—*Vide Times and Morning Advertiser of the 18th May.*

Messrs. ALLSOPP & SONS will thank all persons having reason to doubt the genuineness of any article sold under their name, to send them the earliest information, in order that immediate steps may be taken for prosecuting the parties.

Messrs. ALLSOPP & SONS will be happy to furnish the names of respectable houses, where a supply of their Ales may be depended on, as genuine from the Brewery.

Brewery, Burton-on-Trent.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 6s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## Baron Liebig on Allsopp's Pale Ale.

"I am myself an admirer of this beverage, and my own experience enables me to recommend it, in accordance with the opinion of the most eminent English physicians, as a very agreeable and efficient tonic, and as a general beverage, both for the invalid and the robust."—*Glessen, May 6.*

ALLSOPP'S PALE ALE ONLY IS BOTTLED BY PARKER & TWINING, Beer Merchants, 54, Pall-mall.

IMPERIAL MEASURE.—Quarts, 8s.; Pints, 5s.; Half-pints, (for luncheon,) 3s. per dozen. Also in Casks of 18 gallons and upwards.

## Allsopp's Pale Ale.—Medical gentlemen

who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTY, 132, Upper Thames-street, London.

## Tobacco Smoking.—Tobacco Smoke

contains two very powerful poisons, which, when absorbed by the system, as in ordinary smoking, produce many serious diseases destructive of the physical and mental health of the smoker.

PHILLIPS and CO.'S Patent Condensing and Filtering Pipes and Stems for Meerschaums are the only inventions known that permit of healthful smoking, and which the medical profession will find worthy of their notice as a valuable therapeutic agent in all cases where the smoking of tobacco and stramonium may be desirable.

Read the Smoker's Friend, or the Philosophy of Smoking, which may be had gratis of all Phillips and Co.'s agents, and also of the Patentees and Manufacturers, 9, Lyon-street, Caledonian-road, Islington, London, who will send them post free to all applicants.

A Pipe or Stem sent post free, price 2s. each, or two for 3s. 6d.

## THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## Do you bruise your Oats yet?—New

Oat-crushers, £2 15s., £4 5s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Aerated Waters, and Patentees of the Syphon Vase and Valvular Stopped Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking aerated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

## Major's Remedies for the Horse,

the best and most effectual ever discovered, superseding the "burning iron" and the torture of the "cautery."

MAJOR'S BRITISH REMEDY, for the cure of ringbone, spavins, splints &c. A single bottle sufficient to cure from four to six spavins, £1 15s.

MAJOR'S SYNOVITIC LOTION, (the Remedy, No. 2.) for grogginess, weak joints, sprains of the back sinews, ruptures of the sheaths of tendons, suspensory ligaments, shoulder lameness, and inflammation; also for the cure and prevention of breaking down, &c.—In bottles, large size, £1 1s.; small, 10s. 6d. each. The above invaluable remedies can now be forwarded to any part of the United Kingdom. Pre-payment by check or post-office order, made payable to Joseph Major, Post Office, Charing-cross.

JOSEPH MAJOR, Horse Infirmary, British-yard, Cockspur-street, Charing-cross.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttee P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"To Mr. Brown." "Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham." Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiralty-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

**Asthma, Chest, and Throat Affections.**—Immediate Relief and Effectual Cure by Markwick's Patent 2s. 6d. Respirator, Chest Protector, &c.  
**GOUT, RHEUMATISM, and LUMBAGO.**—For a speedy Cure, use Markwick's Patent Plaine Gout Socks and Gloves, Knee and Shoulder Caps, Lumbago Bands, etc.  
**SHOE SOCKS**, of Markwick's Patent Plaine, surpass every other for comfort; being waterproof, you are also protected against damp.  
**MARKWICK'S PATENT SPONGIO-PILINE POULTICE or FOMENTATION**, is invaluable for its extraordinary efficacy, easy application, cleanliness, and durability.  
**G. TRIMBEY**, sole Manufacturer, Queen-street, Cheapside, London. Sold retail by all respectable Chemists and Druggists.

**TO THE SURGICAL AND MEDICAL PROFESSION.**  
**W. F. Duroch, late Smith, begs to**  
 inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas'-street, (near the Hospital), in Southwark.  
 Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.  
**SPECULUM ANI**, made by W. Duroch, for John Hilton, Esq., may be had at a moderate price.

**Every excellence which the**  
 Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.  
 H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.  
**HUXLEY and CO.**, 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**RUPTURES.—BY ROYAL LETTERS PATENT.**  
**The Moc-Main Lever Truss is**  
 allowed by upwards of 300 Medical Gentlemen to be the most effectual invention in the curative treatment of HERNIA. The use of a steel spring, so often hurtful in its effects, is here avoided; a soft bandage being worn round the body, while the requisite resisting power is supplied by the MOC-MAIN PAD and PATENT LEVER fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fall to fit) forwarded by post, on the circumference of the body two inches below the hips being sent to the Manufacturer, Mr. WHITE, 228, Piccadilly, London.

**ELASTIC STOCKINGS FOR VARICOSE VEINS**, and all cases of Weakness and Swelling of the Legs, Sprains, &c. They are porous, light in texture, and inexpensive, and are drawn on like an ordinary Stocking. Price from 7s. 6d. to 16s.

MANUFACTORY—228, PICCADILLY, LONDON.

**Mr. Bourjeaud's Registered Elastic**  
 APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

**FIG. 1. THE THIGH AND KNEE-PIECE.**—Mr. Bourjeaud begs to state that these are combined to answer certain purposes of compression when oedema or distension of the thigh and knee exist together.

**FIG. 2. SPIRAL STOCKING MADE TO FIT FROM THE TOES TO ABOVE THE KNEES.**—This appliance is one of the most valuable, and gives such support to the whole limb that the venous blood is returned with great ease. Patients affected with varicose veins should generally resort to this stocking, which, like the other appliances, is made of varying compressing force to suit every shade of difference among patients. All the above spiral apparatuses may be put on with the greatest ease, as they will stretch to almost double the size, and the force is so managed that support is given without creating the least uneasiness.

**Mr. T. H. Wakley's Stricture Instruments.** Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

**New Urethrotome, by Mr. Ure.**  
 Surgeon of St. Mary's Hospital, described in THE LANCET of June 10th. —Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

**PATENT SELF-ADJUSTING TRUSSES.**  
**Salmon, Ody, and Co., most respect-**  
 fully inform the Public, that their Patent Self-adjusting Trusses afford more ease and security for the relief of HERNIA than any other instrument for the purpose. They will answer for right or left side, requiring no under-strap or any galling bandage. Persons in the country are requested to send the circumference of the body one inch below the hips.  
**CAUTION.**—As many mercenary druggists are vending an inferior article, purchasers are requested to observe that SALMON, ODY, and CO., 292, Strand, London, is marked upon the leather case.  
 Sold by one or more druggists in every city and principal town in the United Kingdom.

**A New Discovery.—Mr. Howard.**  
 Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.  
 52, Fleet-street. At home from Ten till Five.

**Teeth.—Mr. Alfred Jones, of Gros-**  
 venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Teeth—By Her Majesty's Royal**  
 Letters Patent.—Newly-invented and Patented application of Chemically-prepared White India-rubber in the construction of Artificial Teeth, Gums, and Palates.—Mr. EPHRAIM MOSELY, Surgeon-Dentist, 61, Grosvenor-street, Grosvenor-square, sole Inventor and Patentee.—A new, original, and valuable invention, consisting in the adaptation, with the most absolute perfection and success, of CHEMICALLY-PREPARED WHITE INDIA-RUBBER as a lining to the ordinary gold or bone frame. The extraordinary results of this application may be briefly noted in a few of their most prominent features, as the following:—All sharp edges are avoided; no springs, wires, or fastenings are required; a greatly increased freedom of suction is supplied; a natural elasticity, hitherto wholly unobtainable, and a fit perfected with the most unerring accuracy is secured; while, from the softness and flexibility of the agent employed, the greatest support is given to the adjoining teeth when loose, or rendered tender by the absorption of the gums. The acids of the mouth exert no agency on the chemically-prepared white India-rubber, and, as it is a non-conductor, fluids of any temperature may with thorough comfort be imbibed and retained in the mouth, all unpleasantness of smell or taste being at the same time wholly provided against by the peculiar nature of its preparation. To be obtained only at 61, Grosvenor-street, London; 22, Gay-street, Bath; 34, Grainger-street, Newcastle-on-Tyne.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MARINA SALT BATHS.

When dissolved in a Cold, Tepid, or Warm Bath, imparts so consistently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 1s. per packet, by the Proprietor, C. MEXING, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTHBERT, 12, John-street, Adelphi, London.

## Pontefract Dispensary.—Wanted, a

**SURGEON AND APOTHECARY** for the above Institution. It is requisite for him to be a Member of the Royal College of Surgeons, and a Licentiate of Apothecaries' Hall; also to have certificates of unexceptionable moral conduct. The salary is £80 a year; with rooms, attendance, fire and lights, in addition, a gratuity of £20 annually, if his conduct be satisfactory. Testimonials to be sent before the 9th of August, the day of Election to be on the 11th.—Apply to BENJAMIN JORRITT, Carleton, near Pontefract.

## Lectures on Comparative Anatomy

AND NATURAL PHILOSOPHY, AT ST. MARY'S HOSPITAL MEDICAL SCHOOL.—Gentlemen proposing to be Candidates are requested to send their applications, with testimonials, on or before Thursday, the 10th of August, under cover, to the Secretary of St. Mary's Hospital, who will also give to candidates any further required information on the subject.

Board-room, July 29th, 1854. S. SKERRETT, Sec.

## University of St. Andrew's.—Notice

is hereby given, that the next EXAMINATION for the Degree of DOCTOR OF MEDICINE, will commence on Wednesday, the 18th of October. Fellows and Members of the Royal College of Surgeons of England, Edinburgh, and Dublin, of the Faculty of Physicians and Surgeons of Glasgow, and Licentiates of the London Apothecaries' Company, are eligible for Examination. Every candidate is required to communicate by letter, with Dr. Day, the Professor of Medicine, fourteen days before the period of Examination, and to present himself to the Secretary for registration, on or before the 17th of October.

By order of the Senatus Academicus, St. Andrew's, 1st August, 1854. JAMES M'BRAIN, A.M., Secretary.

## Sydenham College Medical School,

ST. PAUL'S SQUARE, BIRMINGHAM.—THE SESSION 1854-55 will commence on Tuesday, October 3rd, with an Introductory Address by Dr. BAKERSTON.

Anatomy and Physiology—John White Keyworth, M.B.  
Pathology—James Russell, M.D.  
Practical Anatomy and Demonstrations—Messrs. George Elkington, Frowd Jones, and John Postgate.  
Principles and Practice of Medicine—Bell Fletcher, M.D., F.R.C.P.L., Physician to the General Hospital.  
Principles and Practice of Surgery—Mr. Alfred Baker, F.R.C.S., Surgeon to the General Hospital.  
Chemistry—Mr. Alfred Hill.

### SUMMER SESSION.

Therapeutics—Dr. Russell, formerly Senior Physician to the Birmingham General Dispensary.  
Materia Medica and Pharmacy—Mr. Bassett.  
Midwifery and the Diseases of Women and Children—Dr. Elkington, Consulting-Accoucheur to the Lying-in-Hospital, and Mr. V. W. Blake, Medical Officer to the Lying-in-Hospital.  
Practical Chemistry—Mr. Alfred Hill.  
Botany—Mr. Westcott, Assoc. L.S.  
Forensic Medicine—Mr. Orford, Medical Officer to the Lying-in-Hospital; the Toxicological part of this course by Mr. Hill.

The College is situated within a short distance of the General Hospital, and the hours of Lecture are so arranged as not to interfere with the attendance upon Hospital Practice.

Clinical Courses will be given by those Lecturers who are attached to the various public institutions in the town.

The Introductory Lecture will be delivered on October 3rd, at three P.M., in the theatre of the College; after which, the annual distribution of Prizes will take place.

Further particulars may be obtained on application to the Principal, Dr. FLETCHER, or to Mr. ALFRED HILL, Hon. Sec.

St. Paul's-square, Birmingham, Aug. 1854.

## King's College, London.—Medical

DEPARTMENT.—THE WINTER SESSION, 1854-5, will commence on Monday, October 2, 1854.

The following Courses of Lectures will be given—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854. R. W. JELLY, D.D., Principal.

## TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## West-End.—For Disposal, the Stock,

Fittings, and Goodwill of a respectable and old-established CHEMIST'S BUSINESS, returning £400 per annum (chiefly from Dispensing.) The premises are convenient, in good repair, and moderately rented. The neighbourhood presents an unusually good opportunity for commencing Practice. Purchase money, £350.—Apply to Mr. BOWMER, 50, Lincoln's-Inn-fields.

## Clerical, Scholastic, and Governess

AGENCY OFFICES, (late Valsey, Established 1833,) 7, TAVISTOCK-ROW, COVENT-GARDEN, LONDON. The gentry and families requiring Tutors, Governesses, or Companions, for either residence, travelling, or daily attendance, on making known their requirements to Messrs. MAIR and SON, will at once be introduced ~~FREE OF CHARGE~~ to qualified and experienced applicants with good testimonials. Schools recommended, and Ecclesiastical and School property transferred. A prospectus forwarded on application.

## Westminster General Dispensary,

9, GERRARD-STREET, SOHO. (Established 1774.)

Patron—The Queen.

President—His Grace the Duke of Northumberland.

A Vacancy having occurred by the resignation of the Resident Medical Officer of this Institution, gentlemen who wish to become Candidates for that office are informed that they must be unmarried, Members of the Royal College of Surgeons, and Licentiates of Apothecaries' Hall. Salary £80 per annum, with apartments, coals, candles, and attendance.

Testimonials will be received until the 8th, and Candidates must attend the Board on Thursday, the 10th, at Twelve o'clock precisely.

July 29th, 1854. W. J. G. ESCHMANN, Secretary.

## Dover Hospital and Dispensary.—

Wanted, a RESIDENT MEDICAL OFFICER to this Institution. He must be a Member of the Royal College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of the Apothecaries' Company. He will be restricted from private practice, and expected to enter upon his duties on or about the 1st of September next. His salary will be £90 a year, with furnished apartments, coals, and candles.

Duties and further particulars may be known on application to the Secretary, Mr. Elwin, No. 35, Castle-street, Dover, to whom testimonials may be sent on or before Wednesday, the 23rd of August inst., at Ten o'clock A.M.

The Hospital contains at present Twelve Beds for In-patients.

EDWARD ELWIN, Secretary.

Dover Hospital, Aug. 2nd, 1854.

## Torbay Infirmary and Dispensary,

TORQUAY, DEVON.—HOUSE SURGEON.—The Governors will proceed to the Election of a House Surgeon (to act also as Secretary) to the above Institution, on Thursday, the 24th day of August next. Candidates must send in their testimonials, under cover, to the House-surgeon, on or before Tuesday, the 15th day of August. Candidates must have a diploma from one of the recognised Universities of the United Kingdom, or from one of the Royal Colleges of Surgeons, and must be Licentiates of the Apothecaries' Company. They must be single, and not less than twenty-four years of age. No private practice allowed. The salary is £80 per annum, together with board, lodging, coals, candles, and attendance; or £30 per annum in lieu of board.

Torquay, July 24th, 1854.

## Manchester Royal Infirmary,

DISPENSARY, LUNATIC HOSPITAL, or ASYLUM.—Wanted, in consequence of the resignation of Mr. F. A. Heath, who has completed the period of his engagement, an unmarried Gentleman, as HOUSE SURGEON to these Charities. Every candidate for the office will be required to produce a Diploma from the Royal College of Surgeons in London, Edinburgh, or Dublin, and a License from the Worshipful Society of Apothecaries in London. The duties of the house surgeon are, to assist the surgeons at operations, and in dressing the patients; to visit the patients in the absence of the surgeons, under whose control he is to consider himself; and to take charge of the accidents in the absence of the surgeon of the week. He must take an engagement for one year. No salary is given; but the whole medical and surgical practice of the house will be open to him; and he will be provided with board and lodging in the Infirmary.—Letters from candidates, together with the diplomas and testimonials, are to be sent, free of postage, on or before Saturday, the 26th August next, addressed to the Secretary.

By order of the Board,

Weekly Board, July 31st, 1854. R. THORPE RADFORD, Secretary.

## Derbyshire General Infirmary.—

OFFICE OF PHYSICIAN.—A Vacancy being occasioned by the Resignation of Dr. Bent, the Senior Physician of this Institution, gentlemen properly qualified, wishing to procure the appointment, are requested to send in their applications and testimonials as to their professional qualifications to the Secretary, not later than Twelve o'clock, on Monday, the 21st August next.

No gentleman is eligible who is not a Graduate in Medicine of Oxford or Cambridge; Doctor of Medicine of the University of London, Dublin, Edinburgh, Glasgow, or Aberdeen; or Licentiate or Extra-Licentiate of the Royal College of Physicians in London; or who practises any of the following branches of the Profession—viz. Surgery, Pharmacy, or Midwifery; or who is connected in partnership with any gentleman in such practice.

The Election will take place at a Special General Meeting, to be held on Monday, the 29th August next.

By order, SAMUEL WHITAKER, Secretary.

Derby, 24th July, 1854.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**Unlimited Introduction. Price £600,**  
with immediate and entire possession, a GENERAL PRACTICE in a large and central manufacturing town, yielding over £500 a year. The vendor is retiring from the Profession, but will continue to reside in the place.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**A Medical Retail, nine years estab-**  
lished in the most commanding position on the Surrey side of the Thames, offering to a young Surgeon the nucleus of an extensive and remunerative Practice, is to be sold for £200. Rent £110, of which £48 is let off.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Wilts. — A gentleman of some**  
standing in the Profession can be introduced to an Opening for select General Practice to the probable extent of about £800 a year, by paying a Premium of £250, and taking on Lease, at £100 per annum, Premises and Grounds suited for a small first-class Asylum.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**A General Medical Practice for**  
Disposal, realising upwards of £400 per annum, in a town in Dorsetshire.—Apply to M.D., Post-office, Wimbleton, Putney, near London.

**Wanted to Purchase a Practice of**  
£400 a year, within two or three hours' ride of London.—Address, W. H. S., Michael-place, Brompton.

**A gentleman, of middle age, is desirous of a PARTNERSHIP, or Purchasing a PRACTICE, in Brighton or its environs.**—Address, A. B., 19, Steyne, Worthing.

**Wanted to Purchase a Medical PRACTICE, in a good village or rural district.**—Apply, with full particulars, (to be deemed strictly confidential,) to C. D., 6, Tavistock-street, Covent-garden.

**A gentleman, having finished his**  
studies at one of the London Hospitals, but not qualified, wishes for an engagement as Visiting and Dispensing ASSISTANT.—Address, J. O. S., 50, Union-street, Lambeth-walk, London.

**To be Sold, a Practice, in one of the**  
largest towns in England, averaging for the past ten years about £1000 per annum.—For Terms, &c., apply by letter to Z., care of Mr. Geo. Davies, 4, Pancras-lane, City.

**Medical Pupil. — A married Physician,**  
attached to one of the largest West-end hospitals, and resident within a convenient distance of St. George's, the Middlesex, and University College Hospitals, has a Vacancy for a PUPIL.—Address, M.D., 62, South Molton-street, Grosvenor-square.

**To the Proprietors of Lunatic**  
ASYLUMS.—The Medical Superintendent of a large County Asylum, of considerable professional reputation, and first-rate references, is desirous of an Engagement in a private Asylum.—For particulars apply, by letter, to the Medical Superintendent of St. Luke's Hospital.

**MEDICAL.**  
**To be Disposed of, a highly respectable and well-established GENERAL PRACTICE, in a Market-town in Norfolk.** Receipts, £300 per annum. A good Introduction will be given, and satisfactory reasons why the present possessor retires.—Address, Mr. Fromow, Wholesale Druggist, Norwich.

**TO SURGEONS, &c.**  
**In Kent. — A respectable Practice,**  
Receipts, £500 per annum, for Transfer on favourable terms. Very superior Residence, with large Garden, Coach-house, Stabling, and every convenience.—For Terms, apply to Mr. Jacobson, No. 38, Walbrook, City, near the Mansion-house.

**TO SURGEONS, &c.**  
**Near Cavendish-square, a desirable**  
CHEMIST'S RETAIL for Transfer, that would afford an Opening to a select and extensive Practice. Premises in excellent repair, and at a moderate rent. Purchase, £350.—Apply to Mr. Jacobson, No. 38, Walbrook, near the Mansion-house, City.

**For Disposal, a General Practice,**  
averaging above £800 per annum (without union), situated in a very pleasant neighbourhood, within an hour's access of Manchester by Railway. The present incumbent has held it upwards of thirty years, and is retiring on account of declining health. A good Introduction will be given.—Address, R. S. D., care of Mr. B. Reynier, 166, Dean's-gate, Manchester.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**  
and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Practice at Brompton. — To be Dis-**  
posed of, the nucleus of a Practice most favourably situate in this healthy and agreeable suburb, with very desirable residence attached. The entrance will involve but a small investment.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

**An M.R.C.S.E. and L.A.C. wishes to**  
Purchase a PARTNERSHIP with a gentleman who has a respectable town Practice, and intends retiring in a few years. The half-share to be not less than £400 a year.—Address, A. B., care of Mr. Loveridge, High-street, Merthyr Tydvil.

TO CHEMISTS AND DRUGGISTS.

**A gentleman, wishing to become**  
acquainted with the business of a Chemist and Druggist, is willing to devote his services after six o'clock in the evening in return for instruction.—Address, A. E., 14, Salisbury-square, Fleet-street.

**To be Disposed of, an unexception-**  
able GENERAL PRACTICE. Appointments worth £160 per annum. Established fifty years, in a rich agricultural district. Bonâ-fide income at present, £500; has reached £800. Partnership; or the whole, with Introduction.—Address, M. D., care of Mr. R. Grove, Dudley-road, Wolverhampton.

**Wanted, by a Surgeon in the**  
Country, an active English ASSISTANT, not less than six-and-twenty, fully competent to Visit, Dispense, and attend Midwifery. The most satisfactory testimonials of professional ability and moral character will be required. Salary, £50 per annum.—Address, Medicus, care of Messrs. Corbyn and Co., Chemists, Holborn.

**A Clergyman wishes to place his**  
Son (who has served his time with a medical man in London) in the Family of a respectable Surgeon. He would be willing to make himself generally useful. Salary not so much an object as a comfortable home. The neighbourhood of Birmingham, Wolverhampton, or Dudley would be preferred.—Address, A.M., Post-office, Dudley.

MEDICAL.

**A Surgeon, in good practice, residing**  
in a healthy district, within thirty miles of London, and of easy access, is willing to receive into his house an Invalid or sick Child under sixteen years of age, requiring change of air and medical or surgical treatment. Terms moderate.—Address, M. D., Mr. T. D. Thomson, Bookseller, 13, Upper King-street, Russell-square.

MEDICAL.

**To be Disposed of, in one of the**  
most respectable localities in Dublin, on moderate terms, in consequence of the decease of the proprietor, a MEDICAL ESTABLISHMENT in perfect order, to which is attached a lucrative and respectable PRACTICE. For a General Practitioner it is an opportunity seldom to be met with, as the incoming purchaser would without difficulty realize a considerable income. For particulars, apply to John George Boileau and Company, Wholesale Druggists, 28, Mary's-abbey, Dublin.

**To be Disposed of immediately, a**  
GENERAL MEDICAL PRACTICE, established upwards of twenty-five years in a rapidly-increasing city of 30,000 inhabitants. The average receipts for the last five years exceed £800 per annum, of which about £200 per annum is derived from a Poor-law Union and Benefit Societies, which there is every reason to believe could be secured to a purchaser. A good House, with stabling, &c., and furniture, might be taken with the business.—Apply by letter, post-paid, to D. J. M., 81, Lombard-street, London.

TO MEDICAL PRACTITIONERS.

**The Parents of a Youth, aged seven-**  
teen, wish to Apprentice him to a Medical Man (a Licentiate of the Apothecaries' Company) in London, or a provincial town possessing a Medical School, with whom he would have good opportunities of visiting, when qualified. He has already attended some Lectures at a Medical School, and can read Prescriptions, &c. Having been engaged for several years with Accounts, he could keep the Books very well. He passed the recent Matriculation Examination of the University of London in the First Division. The Medical Profession being his own exclusive choice, he would assist his master to the utmost of his power. If a premium be required, his parents are only able to give a very moderate one. Excellent references can be given, and an interview if required. Address, W. M., Post-office, Wakefield.

PRINTED BY THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county; at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, August 6, 1864.

## British Medical Directory for 1855.

All duly-qualified Medical Practitioners are respectfully requested to forward, as soon as possible, their "ENTRIES" or "RETURNS" for this Annual Volume. References to the Entries in the Directory for the current year (1854), stating that they are correct, will be sufficient. When alterations are required, they should be distinctly specified, and in all cases the names of the writers should be written clearly, and at full length.—Address to the Editors at the "British Medical Directory" Office, 423, Strand.

A New Edition will be ready next week of

## Sulphur, as a Remedy for Epidemic

CHOLERA. By JOHN GROVE, M.R.C.S., L.S.A., &c. &c.  
James Ridgway, Piccadilly; and all Booksellers.

Just published, 8vo, cloth,

## Practical Observations on Conical

CORNEA. By J. NOTTINGHAM, M.D., F.R.C.S., Surgeon to the St. Anne's Eye and Ear Institution, Liverpool.

London: John Churchill, New Burlington-street.  
Liverpool: Deighton and Laughton.

HARVEY ON THE EAR.

Just published, foolscap 8vo, sewed, price 2s. 6d.

## The Ear in Health and Disease;

or, A Manual of Aural Surgery. With Practical Remarks on the Prevention and Treatment of Deafness. Illustrated with Wood Engravings. By WILLIAM HARVEY, F.R.C.S., Surgeon to the Royal Dispensary for Diseases of the Ear.

London: Henry Renshaw, 356, Strand.

Fourth edition, just published, illustrated, price 1s.

## Gilbert on the Extraction of Teeth;

being a work descriptive of a new and much less painful method of operating, by means of GILBERT'S PATENT FULCRUM. The jaw cannot be fractured, or the gums lacerated; there is less danger of breaking the diseased tooth, and of hæmorrhage, &c.

Mr. Gilbert invites the profession to inspect his invention from eleven till four, 3, Suffolk-street, Pall-mall.

"We can confidently direct attention to it as a boon to the profession and the public."—THE LANCET, Dec. 2nd.

"It allows of the extraction of teeth in the most scientific and easy manner; and in performing certain other surgical operations the chair will prove of inestimable value to the surgeon."—MEDICAL TIMES, Feb. 10th.

London: Henry Renshaw, 356, Strand.

No. 1615.

Now ready, Second Edition, in 8vo, boards, price 7s. 6d.

## Dr. Collier's Code of Safety, or Laws OF EPIDEMICS.

Ne quid detrimenti respublica capiat.

London: Longman, Brown, Green, and Longmans.

Will be published in a few days, a Pamphlet,

## On the Use of Vegetable and Mineral

ACIDS IN THE TREATMENT, PREVENTIVE AND REMEDIAL, OF EPIDEMIC DISORDERS OF THE BOWELS. By J. H. TUCKER, Honorary Secretary of the Epidemiological Society.

London: John Churchill, New Burlington-street.

NEW VOLUME OF

## Braithwaite's Retrospect of Medicine.

JANUARY TO JUNE, 1854.

Just published, price 6s., the Twenty-ninth Volume of this work. Edited by W. BRAITHWAITE, Lecturer on Obstetric Medicine in the Leeds School of Medicine, &c.

N.B.—A limited number of Sets—Vols. I. to XXV.—have been made up, and are offered at the reduced price of £4 in cloth. Separate Vols. at the original prices—viz. Vols. I. to III., at 4s. 6d. each; Vols. IV. to XI., at 5s. 6d. each; Vols. XII. to XXIX., at 6s. each.

N.B.—Vol. XXVIII. contains a General Index to the four previous Volumes. London: Simpkin, Marshall, and Co. Edinburgh: Oliver and Boyd. Dublin: Hodges and Smith.

Illustrated with 250 Wood Engravings. 8vo, £1 5s.

## The Science and Art of Surgery.

Being a Treatise on Surgical Injuries, Diseases, and Operations. By JOHN ERICHSEN, Professor of Surgery in University College, and Surgeon to University College Hospital.

"The aim of Mr. Erichsen appears to be, to improve upon the plan of Samuel Cooper; and by connecting in one volume the science and art of Surgery, to supply the student with a text-book and the practitioner with a work of reference, in which scientific principles and practical details are alike included. "It must raise the character of the author, and reflect great credit upon the College to which he is Professor, and we can cordially recommend it as a work of reference, both to students and practitioners."—MEDICAL TIMES.

"We do not hesitate to say, that the volume before us gives a very admirable practical view of the science and art of surgery of the present day; and we have no doubt that it will be highly valued as a surgical guide, as well by the surgeon, as by the student of surgery."—EDINBURGH MEDICAL AND SURGICAL JOURNAL.

London: Walton and Maberly, Upper Gower-street, and Ivy-lane, Paternoster-row.

Just published, price Sixpence, 6d., cloth, 8s.

## Practical Observations on the Use and ABUSE of TOBACCO.

By JOHN LIZARS, late Professor of Surgery to the Royal College of Surgeons, and Senior Operating Surgeon to the Royal Infirmary of Edinburgh.

W. H. Lizars, Edinburgh; and S. Highley, jun., London.

Just published, price 2s. 6d., cloth, for the

## Society for Improving the Condition

OF THE INSANE, RULES and LIST of MEMBERS; with the PRIZE ESSAY awarded to D. H. TUKE, M.D., of the York Retreat.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 8s.

## The Diseases, Injuries, and Malformations of the RECTUM.

By T. J. ASHTON, Surgeon to the Blenheim-street Dispensary; formerly House-Surgeon at University College Hospital.

"We find in it more information than is to be obtained from any single volume yet published on the subject of which it treats."—THE LANCET.

London: John Churchill, New Burlington-street.

This day is published, price 2d., No. 7, of

## The Epitomist, a Weekly Journal of

Literature, Criticism, Art, Science, and Manufactures; comprising Fiction of the highest class, Reviews of new Works, all the Scientific Intelligence of the week, a list of Patents, with abstracts of Specifications, a Domestic Miscellany, and Correspondence; 32 pages, 8vo.

Office, 49, King William-street (City), London.

Order of all Booksellers and News-venders in the Kingdom.

## Mayall's Daguerreotype Portrait

GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS of EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

## H. Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## Allen's Illustrated Catalogue, con-

taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,)

18 & 22, WEST STRAND.

**If you require Family**

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seals, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Empaled, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, illuminated, and Embellished on Vellum.

H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

## Tarratt's Bandage and Strengthening

PLASTER.—This Plaster, from the nature of the composition and the material on which it is spread, is adapted for a permanent bandage, as it neither produces irritation of the skin, nor, when applied, does heat cause it to lose its adaptation to the part. Having these qualities, it is peculiarly valuable in the treatment of ulcerated legs, varicose veins, &c., where equal and constant support is required. Several of the most eminent surgeons continue to use this Plaster in their practice, preferring it in certain cases to any other. It is well suited for exportation and use in warm climates, the high temperature having less effect on it than on any other plaster.

The profession are referred to Messrs. Westwoods and Hopkins, Wholesale Druggists, Newgate-street, where the plaster may be had in packets containing three yards, for 2s. 6d., or spread upon skins of chamois leather, at 8s. 6d.

Westwoods and Hopkins also call attention to their Compound Adhesive Plaster for fractures and wounds, as likewise to their concentrated preparations, essences, &c.

## Cocoa-nut Fibre Matting and Mats,

of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## To Professional Men and others.—

The Oxford Mixed Doeskin Trousers, price 21s. The Striated Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## Notice.—Before leaving town, Ladies

and Gentlemen should provide themselves with one of Berdoe's well-known VENTILATING WATERPROOF GARMENTS, which resist any amount of rain, without confining perspiration, (the fatal objection to all other waterproofs;) while their respectability adapts them for general use, equally as for rainy weather. An extensive variety for selection.

W. BERDOE, Tailor, 96, New Bond-street, and 69, Cornhill, (only.)

## A Thoroughly Good Fitting Garment

INDISPENSABLE.—To those who have been pestered with badly-cut garments, J. SANDS begs to state that, having had great experience in studying the human form, he will engage to fit the most difficult figure or please the most fastidious taste. In passing his Establishment, 17, HOLBORN HILL (opposite Furnival's Inn), it will be seen that every peculiarity of style is consulted, both in price and pattern. Dress and Frock Coats from 35s. to 70s.; Black Dress Waistcoats, from 8s. 6d., and Trousers from 21s. Fancy Clothing and Juvenile Dresses in great variety.

## To all who cannot get a Fit; the

importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance.

R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## Novelty in Bedsteads, adapted for

the Nursery, Sick Chamber, Sitting-room, and Drawing-room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattress complete, 35s.—the most complete article ever introduced to the public.—

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

## Funeral Extortion avoided, by Exe-

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.

Originated in 1842.

# Recherché Wines! — First-growth

Wines only! At the following very reduced prices, on cash terms only:—

Sherry—"Amontillado and Montilla character." In Dock, at £52 per Butt, £28 per Hhd., £13 per Quarter Cask. Duty paid—£21 per Quarter Cask, £42 per Hhd., £24 per Butt, 42s. per dozen.

Port.—Very rare old Wines, 48s. and 54s. per dozen. Connoisseurs, who cannot suit their taste, except on rare occasions, are invited to try these Wines. Vintage Ports for laying down.

The qualities of Wines most prized being different, some preferring pale, others brown, some dry, some fruitiness and smoothness, all of which are consistent with purity, gentlemen are solicited to call and taste the Wines at Mr. HAMMICK'S Offices, No. 11, Pall-mall, London.

First class! Champagne, Moselle, Hocks, Clarets, Sauternes, &c., at the most moderate prices.

These Wines are patronised and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples, with List of Prices, forwarded on application.

There being no credit on freights, neither on duties, and to buy in the best market, cash terms command every advantage, and are essentially requisite to obtain the best and purest Wines at the lowest possible prices.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

## JOZEAU'S COPAHINE MÈGE.

Or SACCHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1862.) Price per 100, 4s. 6d.; 50, 2s. 8d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Enns, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22s, Henrietta-street, Cavendish-square. — N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Blake's Aërated Citrate of Potash

WATER.—BLAKE, SANFORD, and BLAKE, 47, Piccadilly, have recently prepared an Aërated Solution of Citrate of Potash, which they beg to introduce to those members of the profession who may desire it for the use of their patients. It will be found a valuable auxiliary in the treatment of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicarbonate in each bottle; Soda, 15 grains; Magnesia, 12 grains; and Ammonia, 10 grains. Seltzer, Vichy, and other foreign waters, from the respective analyses.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Aërated Waters, and Patenteses of the Syphon Vase and Valvular Stopped Bottle. The objection generally made to the common soda-water bottle, in the inconvenient attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking aerated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

## Briet's portable Gazogène, OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SELTZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler

PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN, and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## Metcalf and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130a and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

## Warming and Ventilating by Hot

AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Eardiston House Worcestershire, March 1st, 1864.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising, I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Boileve, Esq.

WM. SMITH. (Sir, Baronet.)

## Purification of Linen—Prevention of

Disease.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1863

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1862, by Mr. Boileve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy; I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boileve, Esq.

J. PALFREMAN, House Steward.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment, in the PURCHASE of

NEW WHITE MOULDED VIALS.

\*APSLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., & 1 1/2 oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 sizes 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## ELECTRICITY.

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis or by post for Two Stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 5s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of CHOLERA the continuous current from the colon to the liver has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-battery.) 103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.) Prospectus gratis, or by post for two stamps.

The Policies of this Office are a sure and safe provision for settlements, renewal of leases, security of debts, &c.

The Medical Attendant consulted as the Medical Adviser and Examiner of the Society, is awarded a fee of £2 2s., when the sum assured amounts to £250, and £1 1s. when under that sum. The Medical Practitioner also receives for business introduced by him the usual commission of ten per cent. on the first payment, and five per cent. on the payments of subsequent years.

The Society also claims the support of the Medical Profession on the following grounds—

For several years the "Medical, Legal, and General" was the only Mutual Life Assurance Society connected with the Medical Profession. The rates are lower than those of any other Medical Life Office.

Bonuses divided annually.

Persons desirous of assuring Diseased or Rejected Lives will find that from the experience acquired by this Society it is enabled to accept such lives at rates both equitable and safe.

From the outset the expenses of management have been kept within the narrowest limit, consistent with the efficient working of the establishment.

Loans, Annuities, Endowments, and every form of assurance contingent upon Life, transacted at moderate rates.

ANNUAL PREMIUM FOR ASSURING £100 AT DEATH WITH PROFITS.

Age.	Premium.	Age.	Premium.	Age.	Premium.	Age.	Premium.
15	£1 10 10	30	£2 6 2	45	£3 12 3	60	£6 19 0

GEORGE CARR GLYN, Esq., M.P., Treasurer.

The NEW TABLES adopted by the GLOBE include two Scales of Life Premiums, *Participating* and *Non-Participating*, combining, with moderate rates, those principles of solidity and security which have distinguished this Company from its competitors.

Two-thirds of profits apportioned as Bonus.  
One-third of the Premium may remain *Unpaid* as a debt upon the Policy.  
Facilities afforded to Insurers.  
Insurances to the extent of TEN THOUSAND POUNDS on a single approved Life.

Every class of FIRE and LIFE Insurance business transacted.  
Prospectuses, with full Tables and Details, and Forms, may be had at the Company's Offices, or of the Agents.

WILLIAM NEWMARCH,  
Secretary.

**Shower and all Domestic Baths.—**

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECUMBENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

**Cotyledon Umbilicus.—Epilepsy**

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Inspissated Juice. Dose, half a drachm to a drachm; 10s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's Liquor, or Fluid Extract, prepared by Spontaneous Insipitation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

FOR EPILEPSY.

**Cotyledon Umbilicus.—The intro-**

duction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared by Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter never used any but what he has obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

**Hooper's Inspissated Juice of Tarax-**

ACUM, prepared by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE OF SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—DR. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

INSPISSATED JUICE OF COTYLEDON UMBILICUS, for Epilepsy, introduced by Mr. Salter, of Poole (see "Medical Gazette" of March 2nd and May 11th), for whom Mr. Hooper first prepared it, and has continued to do so, Mr. Salter finding it to possess the properties of the fresh juice.

The following remarks of the Rev. A. Leapingwell show the value of Taraxacum when properly prepared:—

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it.

"I remain, yours truly,

ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Sleaford.

BRIGHTON SELTZER WATER, 4s. per doz. Other factitious Mineral Waters, at a reduction of 25 per cent.

## A Course of Lectures

ON

## DISEASES OF THE EYE,

*Delivered at the Medical School of the London Hospital.*

By GEORGE CRITCHETT, Esq., F.R.C.S.,

SURGEON TO THE ROYAL LONDON OPHTHALMIC HOSPITAL; LECTURER ON SURGERY AT THE LONDON HOSPITAL, ETC.

## LECTURE VII.

*Serous fluid beneath superficial layers of cornea; first described by Mr. Tyrrell: treatment. Conical cornea; peculiar appearance: mechanical treatment. Aquo-capsulitis, or corneo-iritis; seat of the disease; symptoms; history: constitutional treatment; results; diseases of anterior chamber. Hypopion: various causes; blood in anterior chamber; abnormal accumulations of fluid in anterior chamber.*

GENTLEMEN,—In my last lecture, I described the history of "corneitis," as the specific disease of the cornea; and before I proceed to deeper textures, I propose briefly to notice some other changes that occasionally occur in that tissue. Cases sometimes present themselves, in which a superficial layer of the cornea is separated from the rest by the infiltration of a small quantity of clear, serous fluid, resembling a minute blister. This may be raised and flaccid, so that on pressing the surface with the lid the fluid may be seen to move between the layers; or it may form a defined, circumscribed, tight, transparent blister; or the fluid may be somewhat opaque and infiltrated between the layers of the cornea, so as to resemble, on a cursory view, an ordinary circumscribed opacity. These are modifications of the same disease, and though rare, have each come under my observation at intervals, and have impressed their symptoms strongly on my mind, from the painful and intractable character they assume. They are often found in eyes that have been previously damaged by inflammation of the globe; and when they occur in a healthy eye, they produce more or less permanent damage to the sight. The appearance of this loose form of blister is very peculiar and characteristic; the fluid is quite superficial and transparent, and only partially fills up the space in which it is contained, so that the little bag is compressible, and the fluid moves as the lid is passed over it. Some of the cases that I have met with of this affection have occurred in eyes previously injured by deep-seated inflammation of the globe, attended with abnormal firmness and tension, and I have attributed this peculiar change in the cornea to this cause. The pain is severe and intermittent, and does not very readily yield to any form of treatment. Where the blister is small, circumscribed, slightly opaque, and less flaccid, the disease occurs in a previously healthy eye; but like the one I have just described, it is very painful, persistent, and ultimately leads to penetration of the cornea.

Mr. Tyrrell has very clearly described this curious affection. He is of opinion that it occurs in persons suffering from some organic disease, and mentions its extreme intractability, and particularly recommends warm baths. I think that where there is evidence of an over-distended globe, and the pain is very severe, it may relieve the symptoms to introduce a fine needle through the cornea, and allow some of the aqueous humour to escape, and this may be repeated, if necessary, from time to time, until permanent ease is obtained. I have not found any other local treatment of any use in the few cases that have come under my notice.

I have now described the principal changes that occur in the true corneal tissue as the result of inflammatory action; and I proceed, in the next place, briefly to notice an alteration in the form of the cornea that is occasionally observed to take place, to which the term "conical cornea" is applied. Instead of presenting its usual convex surface, it is gradually raised from the circumference towards a central elevation, more or less prominent, so as to present a complete cone. The appearance is peculiar and characteristic, and can always be recognised when it has been once seen; the apex glistens, and the eye looks as if a piece of solid glass had been stuck on to the centre of the cornea; in fact, it was thought formerly to consist of a solid thickening of this body. In the latter stages the extreme apex sometimes becomes opaque, probably on account of the friction and irritation of the lids; it occurs usually soon after puberty, and most commonly in the female; it generally attacks both eyes, but not

No. 1615.

simultaneously, nor to an equal extent, and one remains permanently more seriously damaged than the other. This change occurs very slowly, occupying many months, and even years, and, having attained a certain point, usually remains stationary; there is no pain or other evidence of inflammatory action. The cause of this change is very obscure; it is generally observed in feeble, ill-nourished persons, and is probably due to some partial arrest of nutrition, giving rise to a gradual thinning of the cornea towards its centre. Such, in fact, was found to be the condition of the part in a case examined by Professor Jäger, of Vienna, after death, and it seems highly probable that this is the usual condition of the part in this disease. The important practical point is the serious damage to the sight, occasioned by this change; the rays of light are so very much refracted, that images are very imperfectly formed upon the retina, and only when held very close to the eye, and when they are of some considerable size; where the apex of the cornea has become opaque, even this very short and imperfect vision is lost.

As regards treatment, we certainly possess no means, either local or constitutional, that can restore to the part its normal shape; the utmost we can hope for is to arrest the morbid change at the stage at which it first comes before our notice, and even this it must be admitted is very doubtful. The best plan seems to be by the use of some mild local astringent collyrium, and by the exhibition of tonics to check the progress of the disease. Another important consideration is to endeavour, by some mechanical means, to obviate or diminish the extreme refraction of the rays of light; various plans have been suggested for this purpose: thus it has been proposed to remove the lens, also to employ an extremely concave glass; both these means having a tendency to counteract the effect of the extreme convexity of the cornea. The late Mr. Tyrrell proposed to draw the pupil towards the margin of the cornea, where the convexity of the cornea is not in an extreme degree; and he states that he has done this with very marked benefit in some cases. Again, it has been proposed to shut off all rays except those passing through the apex of the cornea by means of a small aperture through a thin, dark substance, or, what is better, by means of a fine horizontal slit through some dark medium; this last method I have sometimes found of great service, enabling the patient to see both near and distant objects with great precision, and even to read with ease. This is, upon the whole, the most efficient palliative means we possess, but in some cases it altogether fails, and we may then try the effect of an extremely concave glass. I recently had an opportunity of examining a case of conical cornea that was under the care of my friend, Dr. Miller, of Stoke Newington; the vision of this patient was considerably lengthened and improved by the use of a concave glass that had been made at Dr. Miller's suggestion and under his direction with a degree of concave power far beyond that usually employed by opticians. If we could only succeed in exactly counteracting the excess of the refraction by a corresponding concavity in the artificial lens, we might hope to produce a very perfect result in mild cases where the cornea retains its transparency at its apex. The case I have seen is encouraging, and the subject well deserves further efforts and investigation. I have had no experience as regards the removal of the lens, but should anticipate advantage from it. Mr. Tyrrell's plan of making an artificial pupil has not been found of much value in other hands.

In an ingenious monograph upon this subject, published some time back by Dr. Pickford, of Brighton, the writer stated that he had found considerable advantage from the constant and prolonged use of emetics. I must confess to considerable scepticism as to the value of this treatment. In a disease so slow in its progress, and so prone to become arrested spontaneously at various stages, it is a matter of extreme difficulty (requiring a large number of cases and high powers of mental scrutiny) to estimate the value of any remedy. It is contrary to all analogy and probability to suppose that a cornea that has become altered in shape should be restored to its normal state by any constitutional treatment. I should therefore be very unwilling to subject a patient to so severe and trying an ordeal as is here recommended, with so very slender a prospect of advantage to the sight, and so much risk of constitutional damage.

Proceeding onwards, from the diseases of the proper tissue of the cornea, we come, in the next place, to the diseases of the parts lining and filling the aqueous chamber. To the most important of these the term of "aquo-capsulitis" has been applied. It seems doubtful whether we are justified anatomically in using this term; recent investigations show

that there is no distinct membrane lining the aqueous chambers. The disease that I am now about to describe, of which I have seen very many well-marked examples, and which is well figured in Mr. Dalrymple's plates, is probably seated in the inner or the elastic layer of the cornea, and extends slightly and superficially over the surface of the iris—perhaps the term "corneo-iritis" would most correctly indicate its true seat. This disease resembles, in some respects, "true corneitis;" it occurs most frequently in children and in young adults; it comes on very insidiously, usually attacks one eye at a time, and is often limited to one eye; the pain is slight; there is but little intolerance of light; the patient chiefly complains of dulness of vision; the sclerotic vessels around the margin of the cornea are considerably injected. On examining the cornea carefully, it is observed to be quite smooth and bright upon its surface, instead of finely granular, as in corneitis; and upon the inner layers of the cornea are some tolerably well-defined whitish spots or patches, varying very much in size, shape, and thickness, but they are usually round, and most thickly studded near the centre of the cornea. I have seldom seen them quite at the circumference. It is very difficult to ascertain how far the iris is involved, because, looking through an altered medium, its colour seems changed, and its natural transparency lost. This, however, is frequently not the case in the early stage of the disease, as shown by the perfect activity of the pupil; and, when it extends to the iris, it seems to be limited to the delicate membrane covering it, and not to invade its proper texture, because the pupil can generally be acted upon by belladonna; and when the cornea regains its transparency, no change is observable in the iris, except some slight adhesions to the capsule of the lens, although, during the height of the disease, I have on several occasions observed large red vessels on the surface of the iris.

This disease presents great varieties as regards its intensity. In some cases, almost the only evidence of the disease is the presence of a few small, well-defined spots on the inner surface of the cornea, the remaining parts being clear and bright, and vision being only slightly interfered with, and there being little or no increase of vascularity; whereas, in the other extreme, the patches on the inner surface are larger, more irregular in shape, and denser, and the intermediate parts of the cornea are hazy, the surface of the iris is dull and vascular, the sclerotic vessels are much injected, and there is severe, dull, aching pain, and intolerance of light; vision is also very seriously impaired. Between these two extremes we find every shade of difference. This disease belongs to the same family as corneitis; it is less frequent in children, and never occurs, according to my observation, after the middle period of life. I have most frequently met with it in young adults of a feeble constitution, with a tendency to struma; and in the more severe cases, where the cornea and iris have been rather seriously implicated, and where adhesions to the capsule and slight dulness of the surface of the capsule remain, I have had reason to think that the disease might be traced to some remote syphilitic taint, either hereditary or acquired, but usually the former. It is very protracted in its duration, and does not seem to yield to any specific plan of treatment, but usually passes away from the surface of the cornea at the end of some months, leaving, in the more severe cases, some adhesions of the pupillary margin, and a slight dulness over the surface of the capsule of the lens, which never, under any circumstances, disappear when they have once formed. Such adhesions do not prevent some action of the pupil, and allow much more accurate vision than the appearance of the eye would indicate.

The treatment should be principally directed to the establishment of general power, and the exhibition of some mild alterative tonic. Preparations of iodine and the iodide of iron seem to be useful; and where any syphilitic taint is suspected, small doses of mercury are indicated, and appear to act as a tonic. I have been particularly struck with the value of this medicine in those cases that I would denominate strumous-syphilitic, occurring in children from eight to twelve years of age, where the condition of the eyes I am now describing has formed part of a group of symptoms resembling very closely the tertiary forms of syphilis, such as loss of the soft palate, exfoliations about the nasal bones, periosteal inflammations, &c. Such cases I have attributed to the engrafting of some hereditary syphilitic poison upon a strumous diathesis; and it is in such cases that I have found mercury act most favourably. The local treatment should be merely soothing; and where there is reason to suspect that the iris is involved, belladonna may be advantageously employed in the early stage, to prevent adhesions, and to counteract any tendency to closed pupil.

I now pass on to the consideration of some of those changes that are observed to take place within the anterior chamber of the eye. The first of these that I would notice, is the occurrence of pus in this situation, which gravitates to the lower part of this cavity, and is termed hypopyon; as this is a symptom resulting from various causes, it is not correct to describe it as a separate disease, but it may be convenient to mention some of the usual sources of this morbid product within the aqueous chamber. The most common cause of pus in this situation is, according to my observation, the occurrence of an ulcer upon the inner surface of the cornea, corresponding to a similar ulcer on its external surface, the middle lamina remaining entire; the matter may often be seen trickling down from the ulcerated part to the bottom of the anterior chamber, where it remains during the upright posture, but readily passes to either side when the head is sufficiently inclined either way; another source of this symptom is an abscess between the layers of the cornea bursting internally; occasionally, in very acute inflammation of the aqueous chamber, pus is poured out into this cavity without any evidence either of an ulcerated surface or of a false membrane. An organized tubercle upon the iris may suppurate, and thus become a source of this symptom, and in one or two rare instances I have seen hypopyon follow a severe attack of fever in an eye in other respects perfectly normal and free from every trace of inflammatory action, analogous, in this respect, to the manner in which pus is found in other cavities of the body after fever, irrespective of inflammation. The presence of matter in the anterior chamber is of no moment, except as it forms an index and measure of the amount and severity of diseased action that is going on in the eye. It has been suggested to evacuate it with a small cutting needle; this would be a rash and injurious proceeding, unless the extreme pain and severity of the general symptoms indicated aggravation from tension of the globe, when great relief may follow the evacuation of the pus together with some of the aqueous humour; such cases must be treated in other respects upon such general principles as I have already laid down—warm and soothing appliances being more particularly indicated where pus is present. Occasionally blood is found in the anterior chamber, this is usually the result of a blow, but in a few rare instances it has been found to be vicarious with the menstrual function. Blood becomes readily absorbed in this situation; but it is important to give a guarded prognosis, as it probably results from such an amount of violence as will cause some permanent injury to one or more of the delicate structures of the eye, which will not show itself until the blood is entirely absorbed.

There is yet one other curious change in the anterior chamber of the eye which I have often observed, and which deserves notice: the natural secretion becomes altered in colour and quality, being yellow, and highly albuminous, and much increased in quantity. The result of these changes is, that the cavity is much increased in size by the thrusting back of the iris and lens, and the surface of the iris appears of a green colour; there is also very severe pain and tension, and much dimness of vision. I believe this disease usually occurs in an eye that has been more or less damaged by previous attacks of inflammation of the deeper textures, attended with adhesion between the iris and the capsule of lens to such an extent as to convert the anterior chamber into a perfect shut sac. The best mode of relieving the pain, in these cases, is to puncture the cornea with a needle, so as to evacuate a portion of this yellow, albuminous fluid, so as to remove all tension. The iris will then fall forwards, and resume its natural colour, showing that its green aspect was due to the yellow secretion in front of it. This gives immediate ease; but it often happens that the same thing occurs again and again, and requires a repetition of the same plan until the abnormal tendency is worn out. It is important not to allow all the fluid to escape, otherwise the iris will fall in contact with the cornea which for a time occasions great pain. The peculiar appearance arising from this abnormal accumulation and change in the aqueous humour can never be mistaken when once seen. It is admirably portrayed in one of Mr. Dalrymple's plates of "Diseases of the Eye."

ON

## SILICATE OF IRON AS A URINARY DEPOSIT.

By JOHN HARLEY, Esq., Stockport Infirmary.

WHILE engaged in examining the urine of patients suffering from various diseases, the secretion containing the above deposit came under my notice.

The subject is a strong, plethoric woman, aged forty-six, unmarried. Catamenia ceased for the last six years. She

states that she had fever about two years and a half ago, which chiefly affected the kidneys, since which she has experienced shooting pains in the lumbar regions, accompanied with scalding and irritation on micturition. This has continued with greater or less severity up to the present time, but has never prevented her from following her employment, which is altogether confined to the house, and that principally during the night. Appetite and digestion extremely good, as is the health, with the exception of the urinary irritation, which is sometimes severe, and at others amounts to nothing, and some slight oedema of the legs.

My attention was first called to the urine in the early part of December last, from which date up to the present time I have had the opportunity of daily examining it. The results are the following:—

December 4th.—Urine amber-coloured, acid, specific gravity 1·020, having an abundant, light-coloured, flocculent, gelatinous-looking precipitate, occupying about one-third of the volume of urine, together with a heavier, sandy-looking one; irritation excessive.

Dec. 4th to Dec. 30th.—The urine still retains the same characters, but the sandy-looking deposit has decreased in quantity; specific gravity averaging about 1·013; irritation much diminished.

Dec. 30th to Jan. 12th.—The secretion is for the most part pale-coloured; specific gravity ranging from 1·010 to 1·013. The appearance of the urine is much the same, having a light-coloured precipitate floating on a now scanty, sandy-looking one, whose colour is generally dirty-white, but occasionally it has a reddish tint.

The average quantity of urine passed in twenty-four hours for one week was forty ounces. The irritation and lumbar pains have now almost entirely ceased.

Jan. 12th to March 9th.—Urine presenting the same features, with now and then an additional deposit of urate of ammonia, and occasionally one of uric acid, sometimes in thick lozenges, and at others in beautiful, aggregate prisms. The sandy-looking deposit varies in quantity, but for the most part remains now as little more than a sprinkling at the bottom of a broad vessel, while the flocculent one occupies about an eighth of the volume of the urine. Quantity voided in twenty-four hours varying from forty-three to fifty-five ounces, once attaining eighty-seven ounces. Average quantity for a fortnight between these last dates, fifty-one ounces. Specific gravity generally about 1·012, falling as low as 1·008 in that whose quantity amounted to eighty-seven ounces.

From these statements it will be seen that these two deposits were constantly present in the urine, and evidently bearing some ratio to each other, and to the amount of irritation experienced.

*Examination of the deposits.*—On decanting the supernatant urine, and boiling the remainder, the flocculent deposit was dissipated, and the heavier one quickly subsided. This latter was separated from the urine, well washed, and boiled in water, after which it remained as a dirty-looking, fine, sandy powder, which was apparently unaffected by boiling with the dilute or concentrated mineral acids, but the presence of sesquioxide of iron was plainly demonstrable in all, after being so treated, the hydrofluoric excepted, in which the deposit was partially soluble. Exposed to heat it blackened, from the decomposition of a trace of organic matter present, but was with great difficulty fusible before the most urgent flame of the blowpipe. Mixed with an excess of pure carbonate of soda, and fused in a platinum spoon, and the hard, greyish, semi-transparent mass boiled in a quantity of water, a portion remained undissolved. The watery solution treated in the usual way with hydrochloric acid yielded pure silica. The above insoluble residue dissolved immediately in dilute hydrochloric acid forming a yellow solution, which, on the application of the suitable re-agents proved to be one of sesquioxide of iron. It was unaffected by ferricyanide of potassium, showing the absence of any proto-oxide. Repeated analyses proved these two substances, silicic acid and sesquioxide of iron, to be present in the deposit in equivalent proportions,  $\text{Fe O}_2 + \text{Si O}_2$ —that is, in nearly equal parts.

With regard to the flocculent deposit, a microscopic examination showed it to consist of separate and distinct nucleated cells, which, under a quarter-inch object-glass, appeared as beautiful globules, rather larger than those of ordinary mucus, having a well-defined margin, and containing from three to five distinct nuclei. I have not the least hesitation in referring these cells to what Dr. Golding Bird has provisionally termed "organic globules;" and this case agrees with his experience, that their presence is indicative of great irritation in the urinary organs. Mixed with these globules could be seen, under the microscope, transparent, irregular particles of the siliceous

deposit, a portion of which was always suspended amongst them in the urine, and would become deposited on boiling it.

The decanted urine was apparently normal, always possessing an acid reaction. The urea was found deficient in quantity, amounting to only 8·77 grains in 1000. We must not forget, however, that the amount of secretion is nearly double that given as the usual average.

From the following analysis of the bright, filtered urine, it will be seen that it contained a comparatively large amount of silica.

In 21,000 Grains of Urine, Specific Gravity 1·013.		In 1000 Grs.	
	Grs.		Grs.
Chloride of sodium, phosphate of soda, chloride of ammonium...	216 ... ..	10·28	
Phosphate of lime and magnesia	23 ... ..	1·09	
Sesquioxide of iron, a trace	— ... ..	—	
Silicic acid	5 ... ..	0·238	
Total amount of inorganic salts	244 ... ..	11·608	

The quantity of urine voided on this occasion was fifty-two ounces in the twenty-four hours, thus giving 5·4 grains of silicic acid present in the fluid portion of the secretion for that period.

Another quantity of urine, (eighty-seven ounces, specific gravity 1·008,) passed in twenty-four hours, furnished exactly the same quantity.

The presence of so large a quantity of silicic acid in this secretion, and its combination with sesquioxide of iron, as a distinct urinary deposit, is remarkable, and cannot fail to be of interest, both in a physiological and pathological point of view.

Every care was taken to ascertain, with regard to the ingesta, whether anything unusual was taken, or whether there existed a partiality to any of the ordinary articles of diet, such as bread; but these precautions only served to prove that the woman, although a hearty eater, was not an extraordinary one.

P.S.—For the week intervening between July 9th and 16th, I again had an opportunity of examining the urine. The siliceous deposit had increased in quantity, the secretion still retaining the same characters as noticed throughout. Multitudes of the "vibrio subtilis" were developed in the still acid and undecomposed urine, after keeping the samples a few days.

## POST-MORTEM APPEARANCES IN CHOLERA.

By GEORGE ROBINSON, M.D., Newcastle.

As opportunities of examining the bodies of persons who have died from cholera are not very frequent, only two being inspected post-mortem out of the 1500 deaths which occurred here last year, the following particulars may not be uninteresting to the profession.

About seven o'clock on the morning of Saturday, July 8th, Michael McCann, a labourer, aged about forty, was found by the police lying under an arch near some lime-kilns, in the south-western part of Newcastle, and within a few yards of the river Tyne. He was evidently in a state of great prostration, and was then suffering from vomiting and purging, with severe cramps. He was at once carried to a comfortable bed in the vagrant ward, and the surgeon to the district, Mr. Sang, was sent for, and speedily attended. By this gentleman he was found to be in a state of choleraic collapse, and almost moribund, being pulseless and cold, with rice-water discharge from the bowels, occasional vomiting, and severe cramps in the abdomen. Warm applications, stimulants, and suitable medicines were diligently used, but without avail, as he continued to sink, and died at nine o'clock, two hours after his admission, being sensible to the last. The body was examined eight hours after death, by Mr. Sang and myself, and the following were the only morbid appearances observed:—

The lungs were healthy; the heart, a little enlarged, contained in its right cavities a quantity of black, imperfectly-coagulated blood; at the origin of the aorta were some slight calcareous deposits. The stomach and intestines were unnaturally vascular, and distended with fluid. The peritoneal surface of the latter was of a pink colour, the stomach of a deeper red. On laying open the stomach it was found to contain at least a quart of reddish-brown fluid, suspended in which were several large fibrinous shreds, with a little mucus adhering to them; the mucous membrane of the stomach appeared greatly congested, and many of the submucous vessels were distended with dark-coloured blood. On the greater curvature, and about three inches distant from the pylorus, was a very large coagulum, consisting partly of fibrin and in part of blood; the latter

being in contact with and adherent to the mucous membrane. There was no appearance of rupture of any bloodvessel; the free surface of the fibrin was flocculent, and less tenacious than that beneath. Two or three smaller coagula of blood were also found detached in the liquid along with those of fibrin. There was no food in the stomach, with the exception of six or eight peas, which had been swallowed whole, and one or two of which had been partially acted on by the gastric juice. The liquid gave no indication of the presence of alcohol, nor was there any evidence of the existence of an irritant poison. The liquid contained no free acid, blue litmus paper being quite unaffected by it; its specific gravity was 1.08; tested for albumen by nitric acid and heat, it yielded with each copious coagula, which occupied nearly half the bulk of the fluid. Some of the fibrinous coagula being boiled with liquor potassæ readily dissolved, and were again precipitated on neutralizing the solution by nitric acid. Adhering to some of the coagula were small black particles of carbon, which might either have been derived from the smoky air of the place where the patient was found, or from the water of an open spring situated within a few feet of the same spot. As before-mentioned, the intestines, though more perceptibly vascular than natural, were not so intensely congested as the stomach. They contained a large quantity of fluid, void of feculent smell, and of a much lighter colour than that contained in the stomach. From a small opening made in the colon, half-a-pint was readily collected, and presented the following characters:—It was of a whitish colour, with a very slight lemon hue, somewhat opaque, and presenting, as a sediment, some fibrinous shreds, smaller, and in less quantity than those seen in the stomachic liquid. The specific gravity of the fluid from the large intestine was 1.10; it did not change the colour of litmus paper, and when tested for albumen it merely exhibited greater opacity, but did not present distinct and bulky coagula. The smaller intestines, though generally distended, presented at intervals abrupt constrictions. The gall-bladder was distended with bile; the urinary-bladder was quite empty, its walls being firmly contracted, and in close apposition with each other.

No precise information could be obtained as to the duration of the complaint, but from the circumstance of the patient being found within a hundred yards of the infirmary, it may be presumed that he had no very urgent symptoms when he selected the arch for his night's abode, being probably induced to do so from the warmth which it derived from the neighbouring glass-houses and lime-kilns. Some important inferences may, however, I think, be safely drawn from the preceding facts. In the first place, it is evident that the stomach was the organ chiefly affected, the extravasation of blood, and the effusion of coagulating lymph, and of liquid albumen, being directly traceable to the acute congestion of its mucous membrane, in accordance with a pathological law which I some years since established by a series of experiments. Secondly, the reddish-brown, or chocolate-coloured fluid found in the stomach, evidently derived that colour from the hæmotosine of the extravasated blood, and its presence or absence in the matter vomited in similar cases will assist us in estimating the intensity of the congestion of the mucous membrane of the stomach. Thirdly, it may be concluded that the albumen and fibrinous shreds contained in the liquid found in the large intestine, and which impart its most characteristic features to the "rice-water," or broth-like discharge from the bowels, were in this case at least derived from the stomach, the fluid effused from the intestines having been chiefly of a serous or non-albuminous character. Fourthly, that the relative preponderance of albumen in the stomachic or intestinal evacuation will enable us to determine, approximately, whether the congestion inducing albuminous or fibrinous effusion be seated chiefly in the stomach or intestines.

Time will not allow me to dwell longer at present on the pathology of this remarkable disease, but if the preceding conclusions are confirmed by other observers, they may assist in rendering more intelligible some of the phenomena of cholera, and perhaps eventually guide us to a more satisfactory knowledge of its nature and treatment.

I have not yet heard of any other fatal cases in this district, though a tendency to diarrhoea and gastric irritation undoubtedly prevails.

I must not conclude without expressing my sense of the zeal and activity displayed by Mr. Ingledew, the respected chairman of the Newcastle Board of Guardians, who, at considerable personal inconvenience, endeavoured to investigate the history of the case; and my thanks are equally due to Mr. Sang for so promptly consenting to and conducting the post-mortem examination.

Newcastle, July, 1854.

## CASE OF EXTENSIVE CUT-THROAT.

By GEORGE H. MACNAMARA, Esq., M.R.C.S. and L.S.A., Uxbridge.

PHOEBE H—, aged twenty-five years, had been suffering for upwards of two years with lumbar abscess and scrofulous ulceration of Peyer's glands. On the 9th of April, in the afternoon, I was summoned suddenly to her by a message that she had cut her throat. I found her lying on her right arm and side, with her head slightly bent forward upon a low pillow; her left hand, which was bloody, was closed, and upon the upper part of the chest, immediately below the cricoid cartilage, there was a transverse wound, about two and a half to three inches long, standing out at a right angle from which was the handle of a razor, the entire blade of which was buried in the wound; about a pint and a half of dark, coagulated blood had collected in the hollow formed in the bed by the weight of the shoulders. On trying to remove the razor, the blade was found buried in the trachea, the small end being lodged in the larynx, so that it had to be pushed downwards in order to remove it. The sterno-mastoid on each side was divided to about half its thickness, the cut leaving the posterior portion of the trachea entire, without injuring the carotid sheath.

I made as extensive an examination of the body as the friends would permit, on the 14th, by reflecting the skin over the sternum, and removing the upper half of that bone with the cartilages of the four first ribs on each side. The isthmus of the thyroid gland was divided, and the areolar tissue around and in the mediastinum was much infiltrated with blood. The trachea, through its entire length, from the cricoid cartilage to the bifurcation, was cleanly slit in the middle line down to the last ring, where the extreme point of the edge of the razor had made a small opening in the superior and posterior aspect of the left vena innominata as it crosses over that part, the hæmorrhage from which had evidently supplied the blood found in the bed, and that had caused her death.

July, 1854.

## VARIOLA AND VACCINATION.

By JOHN SMITH, Esq., M.R.C.S.E., Sheerness.

THE following case will, I hope, possess sufficient interest to excuse me for trespassing on your space:—

Mrs. C—, aged forty, was confined on the 21st of April last, being about eight months advanced in pregnancy. At that time one of her daughters was laid up in the same house with small-pox, and another daughter had just recovered. My patient had been feverish, and had suffered from pain in the back two or three days previous to her confinement, and on the following day the eruption of small-pox appeared. I immediately removed the child from the mother, and vaccinated it. On the 29th, notwithstanding there were two well-formed vaccine vesicles on the left arm, variolous papulæ appeared plentifully on the face and chest, and in a day or two all over the body. The pustules, though very numerous, were small and discrete.

Unlike the case related by Mr. Dendy, (*THE LANCET*, June 17th.), in which there was an entire absence of secondary fever and maturation, both were present here; for although, up to the 6th of May, the child appeared to promise recovery, on that day fever set in, evidenced by great restlessness and refusing to be fed. During the next two days many of the pustules burst, and the little patient died on the 8th.

During the last three months I have attended twenty cases of small-pox. They had all been previously vaccinated, but in each fatal or severe case there was only one vaccine cicatrix.

July, 1854.

INJECTION OF TINCTURE OF IODINE AS A MEANS OF DISCOVERING WHETHER FISTULA IN ANO IS CONNECTED WITH ANY INTERNAL OPENING. — M. Limange mentions, in the "*Archives Belges de Méd. Milit.*," that in order to find out whether the fistula in ano of a patient of his had an internal opening, he injected pure tincture of iodine into the fistulous tract, at the external opening, whilst his finger was in the rectum. In withdrawing the former, he saw upon it the usual stain of iodine, and he could judge, by the portion of finger stained, how high the opening was situated. This means of diagnosis is certainly of some value when the ordinary modes of investigation fail to clear up the case, and it is preferable to allowing fluid to regurgitate from the anus by the same kind of injection, as the internal fistulous opening may be so small as not to let any fluid pass through it.

## OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### KING'S COLLEGE HOSPITAL.

#### EXCISION OF THE KNEE-JOINT.

(Performed by Mr. FERGUSSON.)

A FEW years back excision of the head of the femur was viewed with much distrust by a great many surgeons, and warm discussions took place respecting the operation. The opposition became, however, gradually weaker in proportion as the results were more and more favourable, and at the present time the great majority of the hospital surgeons of this metropolis are reconciled to this procedure. The great point with the resection of the head of the femur, as well as with the resection of other processes of bone, is to make a proper choice of cases, the object being to save life before the disease has exhausted the patient, and to favour the formation of a new joint, likely to be endowed with sufficient mobility to render the limb valuable and useful. This end has been attained in several instances, and it is to be hoped that the operation will be the means of restoring to health and usefulness many a sufferer from hip-joint disease.

But it should not be forgotten that there is such a thing as a spontaneous formation of a new joint on the dorsum illi, and that the possibility of such a termination should be kept in view when operative measures are contemplated. No inconsiderable number of young subjects may be noticed in the streets of London, with whom it is evident that the disease has ended in dislocation of a more or less perfect head of the femur on the dorsum illi, the new joint enjoying a very fair amount of motion, and the limb being of course considerably shortened.

Whether excision of the knee-joint will ever gain as much favour as the operation just alluded to is doubtful, because the incisions and removal of osseous parts are much more extensive than about the hip, and the risk of inordinate inflammation and constitutional irritation much greater. Ankylosis of the knee-joint is also a more frequent occurrence than the same change in the hip, and there is less prospect of efficient support from an excised and partly ankylosed knee than from a new joint formed on the broad and resisting surface of the ilium.

But the parallel we have just drawn is not of such immediate practical importance as the juxtaposition of excision of the knee-joint and amputation of the thigh, for these two operations are frequently the only alternatives left. It is, of course, a great advantage to arrest the disease of the knee-joint and preserve the limb, and surgeons would perhaps be inclined always to give a trial to resection before proceeding to amputation, if it were not plain that the work of repair, after excision of the joint, is extremely slow, and may tell injuriously upon an already impaired constitution and weakened frame. Nor can it be forgotten that the interference with osseous texture is much more extensive in resection than amputation, and that a stump is much sooner formed than an imperfect union between osseous surfaces laid bare by the saw. But Mr. Jones, of Jersey, silences objections by pointing to his successful cases, and we gladly submit to such peremptory arguments.

In the case before us, Mr. Fergusson was inclined to allow the knee-joint of his young patient to ankylose, the boy, who is about ten years of age, having suffered from chronic inflammation and disorganization of the articulation for several years. He was admitted into the hospital about six months before the present operation, and his health and the aspect of the joint improved so much that Mr. Fergusson sent him into the country, with the hope that the disease would become arrested, and ankylosis take place. But the poor little boy came back to the hospital with a renewed inflammatory attack of the joint, and no alternative was now left but amputation or resection.

Mr. Fergusson decided in favour of the latter operation, and on the 29th of July the child was brought into the theatre, and narcotized with chloroform. The right lower extremity was much emaciated, the knee-joint presented the usual globular shape, but no fistulous apertures were observable. Mr. Fergusson made the usual H-shaped incision in front of the joint, and having reflected the upper and lower flaps, the condyles of the femur and the articular surfaces of the tibia were removed by the transverse section of a broad and short saw, after the soft parts had been carefully cleared away. Mr. Fergusson had, in previous operations, removed the patella also; but in this instance he left that bone, after having gouged the carious surface it presented. It was also found, when the operation was nearly completed, that the lower part of the shaft of the femur, close to the condyles just removed, was bare of periosteum, and Mr. Fergusson judged it prudent to remove the unprotected portion of bone to the extent of about an inch. When the leg was attempted to be brought on a line with the thigh, it was found that the rigidity of the hamstrings prevented apposition. Mr. Fergusson therefore proceeded to divide the inner hamstring subcutaneously, and no obstacle was then left to the approximation of the osseous surfaces. The margins formed by the incisions into the soft parts were then brought together by sutures, after a small quantity of pus had been pressed out from the side of the head of the tibia.

When the little patient had been removed, Mr. Fergusson stated that he had hesitated between amputation and excision, but that he thought the present a fair case for the latter operation, which, as was well known, had originated in this hospital. Much discussion had occurred respecting excision of this joint; but he (Mr. Fergusson) thought himself quite justified in having recourse to it in cases like the present. He had not been as successful as could be wished in some of the cases in which he had performed that resection, but no better result would perhaps have followed amputation of the limb. (See for these cases *THE LANCET*, vol. ii. 1850, p. 183; vol. ii. 1852, p. 518; vol. i. 1853, p. 367 and 425.)

Mr. Jones, of Jersey, and Dr. Mackenzie, of Edinburgh, had had cases which ended very favourably, and in which scarcely any deformity was left. Indeed, Mr. Jones performed the operation on a patient with whom the hip-joint of the previously sound limb was attacked, after excision of the knee-joint had been performed on the opposite side. Had the limb been removed the patient would have then been thoroughly disabled.

Mr. Fergusson went on to say, that further experience was necessary in order to come to some definite conclusions respecting the operation; but that it might even now be gathered from the twenty-three or twenty-four operations which had been recorded, that some reliance might be placed on this operative procedure.

We need hardly say that we mean to watch this case, and that we shall make it a point to acquaint our readers with the results of the operation. The last patient upon whom excision of the knee-joint was performed at this hospital is going on well; she still wears the apparatus which gives support to the leg, and will, in all probability, have eventually a useful limb. (See *THE LANCET*, vol. ii. 1852, p. 518.)

#### MR. FERGUSSON'S CASE OF INCRUSTATED HAIR-PIN IN THE BLADDER; PRESENT STATE; AN ANALOGOUS CASE IN THE UNITED STATES OF AMERICA.

OUR readers have probably still in their recollection this extraordinary case of lithotritry in the female, and extraction, from the bladder, of a hair-pin surrounded by calculous matter. (*THE LANCET*, vol. i. 1854, p. 662.) We are glad to say that the patient has progressed very favourably, and is not suffering from incontinence of urine. A case bearing the closest analogy to Mr. Fergusson's has been pointed out to us; it is published in the "*Extracts from the Society for Medical Improvement*," October, 1853, and we beg to transcribe it *in extenso*:—

#### "PECULIAR CASE OF LITHOTOMY; SINGULAR NUCLEUS FOR, AND UNUSUAL SIZE OF, THE CALCULUS.

"The specimen was brought by Dr. Wm. G. Wheeler, of Chelsea, Mass., who performed the operation for its extraction.

"Dr. Stedman exhibited the calculus, and gave the following account of the case, furnished by Dr. Wheeler:—

"A female, twenty-one years of age, came under Dr. W.'s care a few months since; she had for a long time suffered severely; all the usual symptoms of stone in the bladder were undeniably present, and, indeed, very marked. A sound being introduced by Dr. W., the presence of a calculus was readily detected. The severity of the local symptoms, and the appe-

rent large size of the stone, were the circumstances chiefly engaging attention. The stone seemed immovable, judging by the impression communicated to the sound while examining; the sensation would perhaps convey the idea of the calculus being fixed at certain points. The patient complained occasionally of great pain in the pubic region, as if something sharp pierced the neck of the bladder. Dr. W. was unable to determine the exact size of the calculus. With the hope that it might be sufficiently soft to be crushed, the operation of lithotomy was attempted. With the assistance of Drs. Stedman, of Boston, and Ingalls, of U.S. Marine Hospital, Chelsea, two trials at crushing the stone were made unsuccessfully; the bladder was contracted and irritable, so as to allow of little or no distension by the injection of fluid; and, moreover, the stone proved to be hard, and of such size and shape, that it could not be held or fixed within the grasp of the instruments. The constitutional symptoms, also, which followed each of the above attempts were severe. Dr. W. feared lest inflammation might supervene, of fatal nature, after the last trial.

"Disappointed as to lithotomy, the operation of lithotomy seemed the only resource. The case was plainly stated to the friends; a preparatory treatment adopted, and the operation urged. On the 1st of October, the patient, having consented, was etherized, and the operation done by Dr. W., assisted by Drs. Stedman and Ingalls. The vagino-vesical method was chosen, as offering apparently the best chance for the patient, on account of the situation of the stone and the contracted condition of the bladder. The patient being placed in the usual position, an incision was carried downwards and backwards upon the groove of the staff; the operator's forefinger, passed through this opening, felt the stone, of large size, and apparently fixed at certain points. Fears of a sacculated condition of the bladder were suggested; farther exploration by the finger discovered a projecting point, which was at first supposed to be a sharp corner or tubercle of the calculus; but it was finally concluded that it was some foreign body which had served as a nucleus for the calcareous deposit. Efforts to break the stone failed; and, the position of the forceps being changed, one blade was passed over the sharp point alluded to, and after much difficulty, manipulation, and delay, a stone was extracted, weighing over two ounces and three-quarters, and there was found passing obliquely through its centre, a large wire hair-pin, measuring over three inches and a half in length. This pin, and the direction it had with regard to the incision, together with the size of the calculus, caused the delay and embarrassment in the extraction of the latter. Thus is also explained the seeming immobility of the stone at certain points.

"The patient survives the operation, and has done remarkably well, with the exception that a small fistulous opening still remains. The local as well as the constitutional symptoms have been very mild, when compared with those which followed the previous attempts at lithotomy.

"The history of the hair-pin is of some interest, as it gives a probable date of the commencement of the formation of the calculus. Since the operation, the patient has stated that the pin was introduced through the urethra about six years ago. She never mentioned this fact to any one, preferring to suffer in silence. The foreign body caused some pain and uneasiness soon after its passage within the bladder; but no severe symp-

toms were manifested until about two years after its introduction, since which time they have gradually increased in severity.

"Dr. Charles T. Jackson analyzed the stone, and found it to be composed mainly of phosphate of lime, coloured a little with urate of ammonia. The rough surface which the calculus presents is owing to the action of the instruments during the previous efforts to crush it. The points of the hair-pin were bent down upon the side of the stone (as seen in the engraving) by the blade of the forceps, thus facilitating the extraction of the mass, and also avoiding laceration of the bladder and adjacent parts, which had suffered so much from continued irritation.

"Four months after the operation.—Dr. W.'s patient is out, and visits her friends; she has regained her usual health and strength. The fistula still remains, and has resisted all the usual modes of treatment; sutures have not been tried as yet, but will be attempted if required. A few weeks since, the opening seemed likely to close, as little or no urine at one time escaped. From cold, or some other exciting cause, a small abscess formed within or near the neck of the bladder, which, in evacuating its contents, reopened or enlarged the fistula again."

## ST. GEORGE'S HOSPITAL.

### IDIOPATHIC PERITONITIS; DEATH; AUTOPSY.

(Under the care of Dr. WILSON.)

INFLAMMATION of the peritonæum is an affection which comes pretty frequently under the cognizance of the physicians and surgeons of hospitals, and these officers have numerous opportunities of practically teaching their pupils how to treat peritonitis, and how to establish the diagnosis. The symptoms are generally the same both in medical and surgical cases, but there is much difference in the ætiology of the disease. The physician has to treat cases of peritonitis which mostly depend on extravasation of the contents of the bowels or stomach arising from perforation after ulceration; or the peritonitis may be the consequence of the extension of inflammation from the liver, the bursting of an hepatic abscess into the peritonæum, or the latter membrane may become inflamed, like any other serous covering, in the course of fever. Peritonitis may also come under the physician's notice as a result of parturition, and he may, lastly, have to treat this affection when no other cause but the application of cold or moisture can be assigned, these latter instances being generally looked upon as idiopathic cases of peritonitis.

We need not say one word of the causes of peritonitis amongst the patients which are seen in the surgical wards; it is well known that here the inflammation can generally be traced to wounds and injuries, the first of these being sometimes inflicted by the surgeon himself in the operation for the relief of strangulated hernia. Here, again, we perceive how important it is that surgeons should not be deficient in what is called pure medicine, as they are often called upon to treat peritonitis, especially in hospital practice. Injuries to the skull or the ribs will also give rise to serous inflammations, which will require medical skill and discrimination.

Both physicians and surgeons are pretty well agreed as to the principles of the treatment of peritonitis, independently of any ætiological considerations; and we generally see, in the wards of hospitals, a vigorous antiphlogistic treatment carried out, which consists of the application of numerous leeches to the abdomen, and the administration of calomel and opium. As to low diet and rest, there need not be any precaution taken, as the patient, from want of appetite and dread of pain, does his best to adhere to these adjuncts of the antiphlogistic treatment.

General bloodletting, as it is called, is but very seldom resorted to, as far as we have seen; and we cannot help thinking that the non-venesection tendency is sometimes carried too far, especially when the case under observation is of the idiopathic kind. The shock resulting from the sudden abstraction of blood, the actual diminution of that fluid throughout the economy, and small doses of opium to soothe irritation and prevent peristaltic action, would perhaps, in such cases, have the happiest results.

These reflections crossed our mind whilst observing, a little while ago, an undoubted case of idiopathic peritonitis at this hospital. The patient, as will be seen by the report of the case, (taken from the notes of Mr. Holmes, surgical-registrar to the hospital,) was in a hopeless state when admitted, and it is probable that all the mischief discovered at the post-mortem examination had at that time already occurred. We are anxious to give a succinct account of the case, as an example of idiopathic peritonitis, an affection but rarely seen in hos-

pitais; and also to impress the minds of practitioners with the fact, that extensive effusion of lymph and the formation of matter in the peritoneal cavity might perhaps be prevented by early and vigorous antiphlogistic measures.

Clementine D—, aged twenty-seven years, was admitted June 19th, 1854, under the care of Dr. Wilson. The patient, who was up to the present attack in perfect health, was seized about midnight, four days before admission, with severe pain in the abdomen, which began at the lower part, and soon spread all over the cavity. Towards morning, sickness set in, but the bowels acted freely, probably by means of medicine. The catamenia had occurred at the regular time, about a fortnight before the attack, and had been quite normal.

No direct antiphlogistic treatment seems to have been employed, and the medical attendant boasted that he had not used the lancet once the last twenty or twenty-five years.

*State on admission.*—Face very much flushed and hot; hands cold; pulse rapid and oppressed; tongue coated, red at the tip and edges; abdomen very much distended, tender, and tympanitic; bowels relaxed, constant feeling of sickness, but now without vomiting.

The patient was ordered a saline draught, combined with chloric ether, also mercury and chalk, with Dover's powder, to be taken at night; rhubarb in the morning, and finally fomentations to the abdomen.

On the third day the abdomen was scarcely so tender, but more tympanitic; the patient had wandered in the night, and the stools were thin, ochry, and rather offensive; the face was not so much flushed; tongue cleaner and dryer; pulse 130, weak.

At night the poor woman was so low that wine was ordered, which was continued next day, with other stimulants; but she became rapidly worse, the skin cold, and the pulse fluttering, and she died the same evening.

*Post-mortem examination fourteen hours after death.*—General appearance: The body was well formed and in good condition, and the abdomen very tympanitic.—Thorax: No pleuritic adhesions, nor any fluid in either pleural cavity. The lower lobe of the left lung was very oedematous, but the upper lobe healthy. In the same locality, on the right side, a quantity of blood was effused in the parenchyma, the remaining portion being healthy. The heart was in a normal condition.—Abdomen: On opening this cavity, which was much distended, the great omentum was found adherent to the front of the small intestines by recent adhesions; the convolutions were everywhere glued to each other with lymph, and the spaces left between the adhesions were filled with pus, forming circumscribed abscesses. Much purulent fluid was found in the peritoneal cavity of the abdomen and pelvis. The ilium and caecum were healthy; in the right lobe of the liver, near its under surface, the substance was congested and infiltrated with pus. All the remaining organs of the abdomen and pelvis were healthy.

### Abstracts and Notices of Books.

*A Treatise on Hooping-cough: its Complications, Pathology, and Terminations.* By GEORGE D. GIBB, M.D. Fcp. 8vo, pp. 395. London: Renshaw.

In his preface to this work, the author makes a kind of apology for presenting it to the profession. This, we believe, was scarcely necessary, for it possesses a quality which, at the present time above all others, should ensure it a welcome. It is thoroughly a practical work. We are not aware, however, that the original parts of the volume occupy any very considerable space; on the contrary, they seem to be contained in a few pages; but the work, as one of reference, is of value, and gives a complete history of hooping-cough in all its bearings. The original portions appear to be the author's views of the nature and seat of the disease, and its treatment by a new remedy. The first he thus sums up:—

"1. Toxication of the blood, produced by some unknown specific influence, peculiar in its nature, not unlike that of measles and scarlet fever, in the circumstance of its affecting persons once during their lives, generally children under five years of age.

"2. Irritation of the terminal loops of the nerves supplying the mucous membrane of the bronchial tubes, producing vas-

cularity and consequent secretion of a greater or lesser quantity of mucus.

"3. Reflex action of the pneumogastric and respiratory nerves, followed by congestion of the vessels of the medulla oblongata and pia mater surrounding it, and also at the origins of its nerves.

"4. Spasmodic contraction of the circular and longitudinal muscular fibres of the bronchi, consequent upon the foregoing, manifesting itself in the series of sudden expiratory efforts, and the well-known sonorous back-draught or hoop.

"5. The immediate result of which is frequent and rapid respiration to compensate for its temporary absence, producing a highly oxygenated or super-oxidized state of the blood, with a tendency to the formation of fibrinous concretions in the heart during the spasms.

"6. As a secondary result of the spasmodic muscular contraction of the bronchi, we have a temporary hypertrophy of the muscular fibres thus acted upon, which disappears again after the cure is established.

"7. The disease is at first irritative and catarrhal, and afterwards nervous and spasmodic, both due to the unknown peculiar exciting cause present in the blood.

"8. It manifests the peculiarity of running a special course through its different stages, three in number, but which may be cut short, or greatly diminished by medicinal treatment."—pp. 211, 212.

The new remedy is thus treated of:—

"It would be presumption in me to say that this substance has been discovered, but in its effects upon the disease, *nitric acid*, in whatever manner administered, not only arrests the paroxysms and removes the hoop, but shortens the disease almost as effectually as quinine does intermittent fever.

"It not only produces a powerful antispasmodic effect, but an equally tonic influence, and supplies to the blood an element—nitrogen—which removes or neutralizes the excess of fibrin existing in that fluid—one of the dangerous elements of the disease—and so destroys the poisonous principle combined with it, which is the primary cause of the affection.

"If this remedy cures pertussis, it differs from the great majority of others in the fact that its action in the economy can be explained upon rational grounds.

"Nitric acid possesses antiseptic properties in a high degree, and probably the influence of these assist materially in the cure by acting directly on the blood, as well as supplying its nitrogen, and prevents the two rapid generation of the fibrin from the albumen.

"The nitrogen acts also as a sedative, in diminishing the stimulating effect of the oxygen so rapidly absorbed, and as an antispasmodic in allaying irritation, and therefore lessening the severity of the paroxysms. If hydrocyanic acid is useful in many cases, it is as much owing to its nitrogen as the sedative and antispasmodic properties which it possesses.

"The presence of the excess of fibrin has been elsewhere explained to depend upon the frequent respirations, immediately after the paroxysms have ceased; it may also be influenced by the peculiar poison itself which has contaminated the blood. Whatever remedy will check this tendency materially assists in the cure; it is in this manner that ether and chloroform act by arresting the process of sanguineous super-oxidation, and, with the other properties possessed by those agents, equally assist in the cure.

"As a general tonic, nitric acid possesses the advantages in pertussis of rapidly allaying the dyspepsia, which is sometimes accompanied with sickness and irritability of the stomach; it restores the healthy state of the mucous membrane of the bronchi, it arrests the spasm, diminishes the cough, and finally dispels the hoop altogether.

"Dr. Arnold and myself have never met with any ill effects from its use, and all the cases treated by it were carried to a successful issue, the cure in all being very speedy, with few exceptions, and the disease being at the same time abridged in the length of its ordinary duration. So far as experience has shown, relapses after cure are very rare indeed.

"Should inflammation of the lungs or abdominal organs have set in previous to its employment, it must be avoided, and the treatment must be adopted as recommended for those complications in the next chapter.

"But if we have reason to fear congestion of the brain or convulsions, the acid may still be safely given, and with good results, for the purpose of lessening the paroxysms. It will also prove useful in the remittent fever, combined with other substances, if there be no existing irritation.

The details of a few cases only will now be given to illus-

trate the successful effects of this remedy, as all possess a similarity in their general features.

"My friend Dr. Arnaldi has treated upwards of one hundred cases of pertussis with nitric acid, with the most satisfactory results; and since I commenced its use, sixty-seven cases were cured at intervals varying from two to fifteen days, but averaging between six and seven days.

"It may be as well to mention here that the object entertained by Dr. Arnaldi, in using this acid as a remedy in pertussis, was to introduce the elements of the atmosphere into the blood by the process of gastric digestion, so as to enable the lungs to outstand the stage of temporary asphyxia, which always is induced during a severe paroxysm. Whether the theory be correct or not, the result, he says, of his practice has been almost universally successful.

"I think it not improbable that the greater portion of the oxygen is chemically appropriated before the blood becomes sensibly relieved by the nitrogen; because, if it were not so, a still greater amount of fibrin would be formed, and a tendency to aggravation, by inflammatory complication would be the result."—pp. 334–338.

The evidence brought forward in favour of nitric acid is certainly very great, and fully warrants its employment in the often intractable disease, whooping-cough. The chapter on the mortality from whooping-cough is deserving of consideration. Dr. Gibb's work is a valuable addition to medical literature.

#### *Lectures on Education, delivered at the Royal Institution of Great Britain.*

*On the Importance of the Study of Physiology as a Branch of Education for all Classes.* By JAS. PAGET, F.R.S.

*On the Importance of the Study of Economic Science as a Branch of Education for all Classes.* By W. B. HODGSON, LL.D. London: Parker and Son.

WE have already had occasion to notice the earlier lectures of the course recently delivered at the Royal Institution, and having now before us the concluding ones, can only reiterate our good wishes for the success of the lecturers in a path so worthy of scientific and benevolent men as in the encouragement of the masses to strive at the attainment of the advantages of the learned; the invitation, in fact, to become partakers of the mental feast which the lecturers one and all have helped to spread. Both the subjects now before us need but little argument, in order to show their importance more or less to every one, and especially with regard to physiology is there a deplorable degree of ignorance amongst the multitude. Mr. Paget claims regard for this branch, more especially as a means of mental cultivation, in contradistinction to the more exact sciences, on the ground that it trains the mind to the contemplation of its own imperfections, by revealing the extent of the field for enterprising investigation and curious research, and by its very uncertainty counteracting the dangerous tendency to that fatal vice or folly, intellectual arrogance. Dr. Hodgson ably defends economic science from the attacks made so wantonly upon it by those who lay at its door the imperfections of its professors, in the same way as religion has been charged with the crimes of those bigots and zealots who have persecuted in its misused name.

It is gratifying to be able to say that the promise afforded by the commencement of this course has not been injured by its close; and important and wide as have been the subjects treated of, they have been touched in an earnest and unpedantic spirit, worthy of admiration and imitation.

## Contemporary Medical Literature.

### AMPUTATION IN COMPOUND FRACTURE WITH GANGRENE.

ONE of the greatest questions in practical surgery is the period at which amputation should be performed in compound fracture when gangrene supervenes. For a long time there have existed two parties in the profession which entertain exactly opposite views upon this point. One contends that you should not operate until the gangrene has ceased to spread,

and that the line of demarcation has been fairly established. This party is headed by the celebrated Pott, and we find amongst its ranks, besides many eminent surgeons, the late Mr. Colles, than whom there was no higher authority on a point of practice. The other party maintains that the operation may be performed while the gangrene is spreading. It is headed by the distinguished Larrey, and we find Guthrie and many other surgeons of repute following on the same side. . . . If within a certain period no disposition to an arrest of the gangrene appears, we ought to operate while the patient is strong enough to bear it. Should, however, the gangrene spread quickly, accompanied by great prostration of strength, delirium, and rapid pulse, the operation is inadmissible.—Dr. WILMOT in *Dublin Hospital Gazette*.

### TUBERCLE AND INFLAMMATION.

The opposing theories of the inflammatory or non-inflammatory origin of tubercle have their supporters. There is no good reason for adhering exclusively to either theory. That tubercle may arise as a mere lesion of secretion may be admitted, while it is not inconsistent with such admission to advance that it is often the effect of low inflammatory action long continued, and therefore amenable to treatment, and in this form demonstrating to us the great practical importance of subduing such treacherous forms of inflammation, whether pulmonary, cerebral, or abdominal, that left unchecked would ultimately end in its formation.—Dr. LAW, *op. cit.*

### PERIOD AT WHICH A DROWNED BODY WILL FLOAT.

A man, named Shoemaker, was alleged to have been drowned on the 4th of September; the body was found floating on the 7th of September, three days afterwards; if it were universally true that bodies do not float until decomposition takes place, (in the waters of the Hudson under from six to ten days,) then this could not be the body of Shoemaker. Amongst the conflicting evidence given on the trial was the following—Dr. Benj. Budd, assistant-coroner in New York, had had occasion to see many drowned bodies, say 150. Never knew a body to rise in less than six days, unless some mechanical means were used to raise it. Should judge the body found to have been in the water from ten to twenty days. Has never known a body to be in the water less than seven days that was mutilated by fishes. Bodies that have been hooked up in three, four, or five days have not that peculiar bleached appearance as those present that come up in from seven to ten days. On the other hand, Henry C. van Wie, four years coroner of the county of Albany, had held a good many inquests on drowned bodies. Has known two or three instances where the bodies have risen in three or four days. They will bleach out directly in warm weather. They will be mutilated by fishes directly after decomposition takes place. Remembers an instance of holding an inquest on a body that drifted ashore, and had been drowned four, five, or six days. Had held in one season inquests on fifteen infants under three months old, found floating in cigar-boxes, near the city of Albany; cases doubtless of infanticide.—*Philadelphia Medical and Surgical Journal*.

### HOW LONG CAN A PERSON REMAIN UNDER WATER AND RECOVER?

A youth, named Ritter, recently fell into Elk river, in New England, and remained in deep water fifteen or twenty minutes before he was brought up, when he recovered as from a regular epileptic fit. He was crossing on a log, when he was seized by a paroxysm of this disease—epilepsy—to which he was subject.—*Op. cit.*

### VENESECTION.

It may be very well to refrain from bloodletting in the treatment of feeble or unsound patients in large cities; but what will our provincial friends say to the wholesale interdiction of the lancet? That we do not now bleed as we formerly did, is obvious enough; but do we err in the opposite extreme? We have ourselves "a theory" that it might be better at once to diminish the quantity of the circulating fluid than to render it unfit to support life, or repair injury by slops and physic. By the way, if it is so bad a practice to bleed, how does it happen that we have so much leeching and cupping, especially in private practice? These questions are worthy of consideration, both in a pathological and medico-ethical point of view.—*Dublin Med. Press*.

## THE LANCET.

LONDON: SATURDAY, AUGUST 12, 1954.

If an honest and well-disposed mind leads its possessor to view with approbation, and to hold up for example, the efforts of a worthy, intelligent man, pursuing the even tenor of his way quietly and unostentatiously, faithfully attempting to fulfil his duty to his neighbour and himself to the best of his ability, doing good as the opportunity arises, and thinking it recreation; so, on the contrary, it is no malignity of temper which forces us to regard as pitiable, if not contemptible, the follies committed by ignorance in power; the shameful abuse of authority which so frequently results from confiding to one unfitted for such a trust, powers which he knows not how to wield. If men will be ignorant and illiterate, let them be so in private and to themselves, but they should beware of setting themselves in high places, or of allowing others to raise them to such false positions as to render their defects visible and conspicuous. A blind man sitting in a private room excites our sympathy, if not our respect; standing at the helm, with the lives of others under his control, he becomes worse than intolerable. Yet how many blind men—blind as regards the duties required from them—there are at the present time holding positions for which they are, by nature, want of education, and by general habits, totally unfitted. Does not a false system of patronage, or nepotism, or carelessness in selection, still act to prevent, as a rule, the best man amongst a given number of candidates from obtaining the appointment sought? Would not PITT, were he now living, be forced still to confess—as he was wont—that he never but once was enabled to present the proper man to the proper office? Fortunately, on many occasions great circumspection in election is not absolutely necessary. Routine duties can generally be performed by very ordinary men, while trifling defects are easily glossed over. Such is not the case, however, in the choice of superintendents for our lunatic asylums, and it requires no lengthened argument—no fine-drawn reasoning—to prove that the head of an hospital for the treatment and cure of insanity should be at least a man highly educated, of a kindly disposition, yet firm withal; one who, having carefully studied the nature, symptoms, and effects of disease as a whole, should have paid especial attention to its reaction upon the mind; and who, by the possession of certain moral characteristics, is able to govern himself, as well as those suffering from delusions. The words of MAS-SINGER may be especially applied to such a man,—

"He that would govern others first should be  
The master of himself, richly endued  
With depth of understanding, height of knowledge."

It is indeed only such a man, or one approaching to this standard, who can properly appreciate the various phases of mental disease, those nice distinctions upon the careful drawing of which the success of our treatment must so commonly depend. Granting these premises, the question naturally arises, where and from what class in society are such men to be sought? Undoubtedly, we say, from the medical profession. The good preliminary education which medical men in the present day generally possess, the training which they have

gone through as professional students, and the whole character of the studies necessary to qualify them for passing the various examination boards, fit them, if not eminently, at least more than any other class of men, for the responsible duties devolving upon those who have the care of lunatics. And this fact, indeed, has been clearly recognised, first, by the Commissioners in Lunacy, and secondly, by a great proportion of the educated public. Still it is not universally acted upon, and there are not a few asylums where the medical officer is yet made the simple tool of a lay governor; where it seems to be thought that the physician's duties are confined to the mere prescribing of physic, while the moral treatment and general control of the patients can be undertaken by any one. Such seems unhappily to be the case at the Norwich County Lunatic Asylum. In this badly-conducted Institution, the steward-superintendent—formerly a ward-attendant at Hanwell—and his wife, the matron, constitute the ruling body under the Committee. They are better lodged, treated with greater respect, and twice as well paid as the medical officer, who is indeed a mere nonentity, and who, together with the attendants, nurses, &c., is controlled by them. All who have had any experience of hospital management can imagine the manner in which this arrangement must work. The superintendent, doubtless a worthy man in his way, cannot be expected, remembering his previous occupation, to be able to govern, with much chance of success, himself, his wife, the doctor, the servants, and the lunatics; and though he may have rules laid down for his guidance as regards a part of his duties, yet it is often considered the sign of a mean spirit to attend to them. Then as regards his lady, who seems to possess energies and talent beyond her station, what a source of regret it must be that she is merely the matron? Is she not justified in enlarging the sphere of her powers? Without the slightest disrespect to matrons as a class, we may say that we have known remarkable women who have been restless and unhappy until they have become the prime ruling powers in the establishments blessed by their attentions, and who have imposed upon themselves the duties of managing the medical staff, secretaries, stewards, patients, and, in some high places, even the committee themselves. Unlike the wife of the hero of antiquity, few of these dames possess "a lazy tongue and a busy hand;" and it does not appear that we can accuse the matron of the Norwich Asylum of having such gifts. Well then, with two such ruling powers, can a third be safely introduced? We think not; and the result proves that such is the case, for within a short time three medical gentlemen have successively been called upon to give up their offices in this Asylum. The last resignation took place on the 18th of July, when the Committee of Visitors called upon Dr. FOOTE to retire from his post, owing to conclusions which they had come to in reference to this gentleman's conduct, he having laid before them facts tending to show that his directions as to the treatment of patients had been disobeyed, and he himself grossly insulted. The main features of the case may be thus briefly stated:—

A female attendant, contrary to general orders, persisted in entering the women's sick ward, where she had no business, and where she created confusion. Dr. FOOTE desired her to keep away from the ward, but the request being unheeded, he complained to the superintendent. On the following day the female still persisted in visiting the ward, and stated publicly that she had orders from the superintendent and matron

to enter the infirmary as often as she liked, and that the medical officer had no business to give any directions to the attendants. As the result of this persevering disregard of Dr. FOOTE's orders, much excitement followed, and two patients in the infirmary became almost infuriated. The matron—the superintendent's wife—here took upon herself the responsibility of ordering the worst of the two cases into seclusion, Dr. FOOTE being actually refused admission into the chamber where his patient was confined. He, however, managed to obtain a key of the room, and had the woman removed. This irritated the superintendent, who seems clearly to have grossly misconducted himself, for in the presence of the attendants he declared that the Doctor's conduct was not that of a gentleman, that he was a humbug, and that he would not allow him to do as he thought proper. Here we have a very pretty quarrel, and one quite sufficient to render the Norwich County Asylum a very unenviable place of residence for either patients or officers. Moreover, as can readily be imagined, this is only one of a long series of fracas, the conflicting views of the medical officer and the superintendent of course leading to constant bickering and disagreement. How is it possible for the patients to be properly treated in a house in such disorder? Is it surprising that when the superiors disagree, the subordinates should look on and neglect their duties? Is it to be wondered at that cases of self-mutilation, of suffocation, of attempts at suicide, and such like, should occur amongst the patients, when we learn that the carelessness of the attendants is such, that on one occasion—and we mention only one out of many cases of neglect—a poor refractory woman had a shower-bath of boiling-water bestowed upon her? We shudder, and ask if such things can be?

In laying these facts before our readers, we have been anxious to avoid looking at the question involved from any narrow point of view. It is not the cause of Dr. FOOTE that we are espousing, it is not the exposure of the Norwich Asylum that we aim at. Our sole purpose is, that the unfortunate insane—those poor helpless creatures whose cause should be the charge of every philanthropist—should be carefully and judiciously attended, that they should receive, at the hands of competent parties, every attention that modern investigations have shown to be necessary for the alleviation of their sufferings; and with this object we call upon the Commissioners in Lunacy to investigate minutely the condition and arrangements of this Asylum, and to insist that in this, as in every well-ordered institution of the kind, the medical officer shall be the general superintendent, and as such, invested not only with paramount authority as regards matters medical, but shall also be responsible for the whole of the internal management of the hospital. Of course, under such circumstances, the resident surgeon or physician must be selected with judgment; his residence must be made comfortable, and he must be paid a liberal salary, so that he may be led to regard his appointment as permanent, and not as the mere stepping-stone to something better; and this being done, all may then rest assured that the more power he possesses, the more careful will he be not to abuse it, but to turn it to a proper account—the happiness of those under his control.

It is related, by one of those sages of olden times whose manner it was to inculcate the principles of morality under the disguise of allegory, that a certain donkey, afflicted with an

insane ambition to pass himself off for an animal of nobler nature, clothed himself with the skin of a lion, and went forth, hoping to reap the honours that are denied to the asinine race. But the stupid creature was condemned by the vanity of his nature to talk. This folly led him to imagine that, in donning the lion's skin, his voice would emulate the lion's roar. He opened his mouth, and—brayed! Since the days of ÆSOP, this fable has never wanted illustrations. Let us point to one.

Two journals, which had throughout an ignominious career deservedly earned more kicks than profit or glory, have recently, after the example of their asinine prototype, taken shelter under a new dress. The *Association Journal* has, like the *Medical Gazette*, cunningly put on the outward form and semblance of THE LANCET. Under this new aspect they look like medical journals of importance. Some folks—but they must of course have minds of an inferior organization to those of the editors—*un sot trouve toujours un plus sot qui l'admire*—may possibly for a short time have been imposed upon, and ignorantly fancied that they beheld a real lion. Alas! the dull creatures are doomed to talk. That sad condition of their being must ever frustrate their ambition. The inharmonious accents betray the ignoble animals beneath.

But however low the instincts of donkeys may be, and however discordant and unintelligible the notes in which these animals strive to give them utterance, it still must be admitted that they have instincts.

We will for once devote a small space to the humble office of explaining the wants of these vainly-ambitious creatures, to whom an unkind nature has denied the honest virtues of courage or the faculty of clear expression. What is the meaning of the last bray? It is simply the same as that which prompted every preceding bray. The great desire of our sky-blue contemporaries is to raise their circulation. They fondly imagine that this end would follow should the circulation of THE LANCET decline. Hence the weekly abuse and insinuation with which we are assailed. Hence their affected regard for "the honour and dignity of the profession." Hence their disinterested patronage of WILLIAM WEBBER, JOHN GAY, and FRANCIS BURDETT COURTENAY; and their co-operation in every dirty intrigue and miserable plot concocted with the sole aim of weakening the influence of THE LANCET. In January last their hopes were raised to an exulting pitch. The staple milk-and-water was profoundly agitated, whipped up into a frothy syllabub, and extraordinary efforts made to coax the profession into becoming purchasers. Disappointed in this attempt, but still thinking the mixture too good to be wasted, although not good enough to sell, they generously gave it away.

In the case of the *Medical Gazette*, the venture was a purely mercantile speculation. Why should not an enterprising publisher, with a keen eye to his market, seek to turn the short-lived sympathy of the profession for JOHN GAY to profitable account? The cost of the operation was staked and lost. But the case of the *Association Journal* is widely different. That *Journal* belongs to an association of gentlemen who cannot be presumed to have any interest, direct or indirect, in the propagation of slander, or in the detraction of the character of THE LANCET—a journal which, we hesitate not to say, has given far more effectual support to their principles than that which is misconducted in their name. But certain persons,

had such an interest, resolved that the *Association Journal*, like the *Medical Gazette*, should be made the vehicle for all the unfounded and unreflecting abuse uttered against ourselves at Hanover-square. They found in the editor of the *Association Journal* a willing accomplice, ready to sell his trust, to circulate any amount of anti-LANCET vituperation, and to compromise the position of his employers. He had, it may well be imagined, no funds at his disposal to devote to gratuitous issues. The disinterested supporters of the "honour and dignity" of the profession, with whom he was in league, found the necessary means. The *Journal of the Provincial Medical and Surgical Association* was sold by its editor, and out came a libel-edition.

But both the *Medical Gazette* and the *Association Journal* missed their mark. The falsehoods disseminated at so great a cost did not long deceive an honourable and clear-sighted profession. The chief conspirator did not dare to confront Mr. WAKLEY before a calm and impartial tribunal, to which he was challenged. The malignant charge, that he was a victim to a persecution set up by the Editor of this journal, met with no countenance but from those whom personal animosity would prompt to believe, or to affect to believe, any imputation against us. But a new plot was laid. Then came another opportunity. The Royal Free Hospital inquest again raised the fallen hopes of the lion-clad journals of asinine substratum. What little wit they had, was exhausted in giving currency to the odious lie that the Coroner for Middlesex had shown corruption in his office. Miserably disappointed in the issue of this investigation, which overwhelmed the promoters and abettors with infamy and shame, our respectable contemporaries had to look about for other materials to whip up another syllabub. They hit simultaneously, we presume by parity of wit, upon the same notable expedient. The recent career of *THE LANCET* afforded no room for attack. The immaculate editors have ransacked the past history of the journal, and trust,—by the dishonest but clumsy revival of passages written in the revolutionary days of the profession, when *THE LANCET* was at fierce war on behalf of the general practitioners against a crushing and intolerable tyranny,—to injure us at the present day in the estimation of those whose battle we have fought and won. No doubt some passages, penned in the fervor and excitement of the fierce contests of a quarter of a century ago, sound harshly now that the victory is achieved, when the abuses that kindled our indignation are well-nigh destroyed, and when the angry passions of that stormy period have been allayed. But why is it that these passages, some of which we ourselves would not now defend, sound harshly upon the ear? The candid reader who would find an answer to this question must not judge the deeds or the language of the past by the present standard of professional feeling. He must transport his mind back to the benighted days when our labours were commenced. Rough work had to be done; and sometimes, we confess it, rough were the means employed. Those were not the days of rose-water compliments and honeyed phrases. They are not many whose memory can recall the position of the profession in those days. For the mass of its members it was an abject, degrading, and ignominious calling. A few college dignitaries, *fruges consumere nati*, monopolised all hospital appointments, and blocked up every avenue to honour and profit. The great hospitals were made the arena of an infamous traffic, and were kept so strictly preserved, that they were useless as centres of instruction, and,

we say it deliberately, often scenes of the grossest neglect and the most inhuman treatment of the poor. Nor need this picture rest upon our testimony alone. Mr. LAWRENCE, the surgeon of St. Bartholomew's, has, like ourselves, stood aghast at "the murderous operations" at that time performed. The attempt recently made by an octogenarian physician to procure the election of his son, in those days would have succeeded as a matter of course. The talents and the claims of a BAY or a KIRKES would have availed them nothing. Such were the abuses we had to encounter. The hospitals were fortresses held by an unscrupulous oligarchy for the oppression of the general practitioners, who, under the name of apothecaries, were snubbed as a half-educated class of an inferior grade. We set our shoulders resolutely against the closed doors, and carried them by assault. From the moment that we established the right of reporting lectures and cases, and threw the broad glare of day and public observation into the hospitals, we date the rapid advancement and spread of the knowledge of medicine, the slower, but yet sure disappearance of nepotism and jobbery, and the enlightenment and emancipation of the great body of the profession. But these triumphs were not achieved without many an arduous struggle.

Let us advert for a moment to the case of Mr. BRANSBY COOPER. It was strongly represented to us that the facts of this case could not be contested—that the interest of the profession, the welfare of the poor patients of the hospital, and the character the journal had acquired for fearless independence, all demanded an exposure. The report, omitting many strong expressions of condemnation, was published. We deny that that report injured Mr. COOPER. It was the subsequent trial that injured him. But we appeal to no more certain proof than that Mr. COOPER himself never entertained the belief that he had been actuated by any other than public motives in the course we had taken, than the fact that, for many years, and up to the period of his lamented decease, we were on friendly terms with him. He sat for his portrait, and furnished the materials for his biography in *THE LANCET*. Is it not, then, a disgusting and transparent hypocrisy on the part of those who now drivel about our being overtaken by a "retributive justice?" Retributive justice implies three things:—First, the commission of an offence worthy of punishment; secondly, the infliction of the punishment due; thirdly, the punishment must fall upon the right person. Can the malignant block-heads who talk of "retributive justice" trace any one of these three conditions? The sin is not proved. The punishment has not overwhelmed us. *THE LANCET* still flourishes, and will continue to flourish when the wretched prints that now disgrace our medical literature shall have gone the way of many former abortions. But if we are not hurt, our Pharisaical friends exultingly imagine that Mr. THOMAS WAKLEY is injured. Supposing that the late infamous plot and absurdly malignant verdict had injured him. Is that retributive justice? What is his offence? But we well know, and the profession well knows, that his reputation cannot be tarnished, nor his prospects clouded, because a stupid jury, hoarded on by recreants to their profession, have been pleased to declare him guilty of unskilfulness in an operation which he did not perform.

But if the history of the late inquest fails to convey the supposed lesson of retributive justice, the impartial spectator will discover evidence enough of disappointed envy, of malice defeated, of treason laid bare. The profession will be able to

determine how far their "honour and dignity" have been sustained by those journals which have fomented the nefarious intrigues of the exploded conspiracy; which have not yet found one word of condemnation for the authors of that foul attempt against the peace and public credit of the profession; and which have not yet evinced the manliness, the professional feeling, or even the discretion, to denounce the dangerous and monstrous doctrine, that the performer and the assistant at an unsuccessful operation ought to be dragged as criminals before the public tribunals.

WE drew attention last week to the circumstance of the Select Committee, appointed by the House of Commons to inquire into the state and means of improvement of the Thames marshes, having lately made its report. There are some points of considerable interest to the profession in respect to the connexion of these marshes with the public health, and hence a few remarks upon the matter may be neither unprofitable nor uninteresting. The attention of the Committee has been more particularly directed to the state of the marshes adjoining the Royal Arsenal at Woolwich. Nevertheless, it may be fairly assumed, from the evidence coming before it, that the Committee had ample reason for believing that the overflowed lands gave a fair representation of the condition, &c., of other and adjacent districts in a similar aqueous state. The Woolwich marsh seems, however, to be a favoured one in more ways than the above, for it is in immediate contiguity with the Plumstead and Erith marshes, where "the water is frequently dammed up, which increases the quantity of decaying vegetation and malaria; and the description of ague from which people suffer in that neighbourhood is stated to be very distressing, and to produce many complications of disease." Nor is this all, for it appears that in the neighbourhood of Woolwich and Charlton many houses have been built, and are building, whose drainage empties itself into the marsh ditches. Now, can it be astonishing that the mortality of Woolwich, particularly East Woolwich, is much higher than the average? But indeed, near as this death-dealing (in more respects, it is clear, than one) spot is to St. Paul's, we need not go even so far for ample illustration of the pernicious influences arising from the overflowed, undrained margins of the river. A trip from the Thames Tunnel to Greenwich will furnish as much as we may desire. Our statements upon this point receive confirmation from the report before us, for "It appears, from the evidence of highly intelligent and eminent gentlemen of the medical profession residing in the neighbourhood of the marshes, on both sides of the Thames below London-bridge, that the diseases prevalent in those districts are highly indicative of malarious influence, ague and fever being very prevalent; that the sickness and mortality are greatest in those localities which adjoin imperfectly drained lands, and far exceed the usual average; and that ague and allied disorders frequently extend to the high grounds in the vicinity." A counter-proof of the truth of the argument is seen in the fact, that in those districts where a partial improvement in the drainage has been effected, a corresponding improvement in the health of the inhabitants has followed. But we would go further than this, and say that even "above bridge" — i. e., between London and Vauxhall-bridges — especially on the Surrey side, ample evidence may be found of the prevalence of the malarious poison; and that the Government establishment of Millbank Penitentiary, and the artizans'

and labourers' houses in the Belvidere and Commercial-roads, and along Bankside, could all furnish sufficient illustrations of the effects of what is usually known as the "marsh poison."

Those who have had much to do with the infants and children of the poorer classes in these localities, will readily bear witness to the truth of this statement, the infantile constitution being one peculiarly liable to evince the effects of this "poison" on the gastro-intestinal mucous surface. To remove these and correlated evils we have not time to dwell upon, is an object, as the Committee rightly observe, evidently deserving the attention, not merely of the landowners and residents in these districts, but of the Legislature. Nevertheless, it appears, that though no engineering difficulties exist, and increased value would be given to the property so drained, sufficient to yield remuneration for the outlay, little will be done until more stringent measures of compulsion are afforded by Government. It is stated that the existing legal powers of the Commissioners of Sewers are inadequate to effect the object desired. "The authority of the Commissioners enables them "to maintain existing works, but they cannot interfere with "the private ditches, nor can they construct any new works "without the previous consent of three-fourths of the owners "and occupiers." The sooner some alteration takes place on these points the better; it is most absurd and self-contradictory to go on as we do, with Committee after Committee endeavouring to find out evils, and then to wind up the Report of each by assuring the public that these evils must remain, as no legal power or private desire appears to exist, sufficiently strenuous, on the one hand to voluntarily carry out, or enforce their removal on the other.

While upon this subject, we may remark it is the opinion of Professor AIRY, the Astronomer Royal, (*Athenæum*, December, 1853), that the vast extent of marshes in the vicinity of the Metropolis, tends greatly to produce our famous fogs. Some have gone so far as to say that the perfect drainage of these marshes would in a very great degree diminish our well-known November accompaniments. Professor AIRY does not think this, however, because, besides the inundated lands, the great body of water in the Thames, which at the season mentioned is constantly warmer by several degrees than the air, is another main source of these irritants to our mucous membranes. Sir HUMPHREY DAVY maintained this latter fact to be the case some years ago. According to the Astronomer Royal, if the Weekly Reports of the Registrar-General are examined, which, beside containing a *précis* of the meteorological observations made under his authority, include observations of the temperature of the Thames water made at the Dreadnought Hospital-ship, it will be found that, in almost all cases, the relation between the temperature of the Thames and of the air will lead the inquirer correctly to infer whether there would be fog or not.

THE old Board of Health, after having become exceedingly unpopular, owing to the misconduct of some subordinates in office, has ceased to exist. A new Board has been constituted by a Bill that has passed both Houses of Parliament, and will receive the royal assent this day. Under the new law, the Board will virtually consist of only one person, who, properly enough, is to be entitled the President. In the absence of a medical functionary, we may heartily congratulate the public on the appointment of SIR BENJAMIN HALL, M.P., to the office just created. It is an appointment that reflects the

greatest possible credit on Lord PALMERSTON, and it will give universal satisfaction. Apart from medical acquirements, a gentleman better qualified for discharging the duties of such a highly responsible situation could not have been selected.

In THE LANCET of October 22nd and 29th, and November 5th, of last year, we urgently pointed out the importance—nay, the necessity—of having a Government Commission to investigate the real nature of Cholera, if we were ever to master that terrible scourge. The arrangements contemplated at present for carrying on the department to which Sir B. HALL has just been elected, do not give us much hope that Government will see the necessity of carrying out our views. The sum provided for the salaries of inspectors, medical men, and engineers, the chief working men under Sir B. HALL, is £5350, to which vote Lord SEYMOUR objected as extravagant! Such a staff as this sum would provide cannot be adequate for ordinary service, much less so for any extraordinary emergency, or for the presence of Cholera.

It is clear that the contemplation of an extensive inquiry, such as we proposed, has never been entertained as part of the duties of the Officers of Health. It may be answered, that the real nature of Cholera may elude investigation. So it may; but is it not worth while making a grand effort to attain such a result as an accurate idea of it? And out of the investigation certain good could not fail to arise. The Commission should be composed of working scientific men, physicians, pathologists, chemists, meteorologists, men acquainted with the use of the microscope, and with ample funds placed at its disposal. Had our advice been taken, something might already have been done. Now the enemy is upon us. Nothing more is known of the disease, or of the means of checking it, than last year; and in every place all kinds of discordant plans of prevention and cure will be as usual proposed, with no one entitled to speak *really* from facts. We feel assured that Sir B. HALL will use the authority derivable from his position to render his department a working one, to surround himself with scientific men, and to procure from Government the means of making his office what it ought to be in the eyes of the profession and the public.

It is with unfeigned gratification that we record the final success of the University of London Medical Graduates' Bill. On Wednesday last, the amendments made in the House of Lords were agreed to by the Commons, and the Bill passed into law. The effect of the amendments referred to was merely to restore the measure to its original condition when brought into the Commons. The University of Durham is struck out, and the right of practice extends, by implication, over Scotland as well as England. We have before expressed our opinion that the little episcopal institution in Durham had made out no title to share the privileges that were acknowledged on all hands to be the clear right of the Metropolitan University. We regard the formal recognition of this right by the Legislature as a signal triumph over the old obstructive monopolies, which, strangely aided by the Scotch corporations, strained every nerve to defeat the Bill. We observe that our accurate contemporaries, anxious in their own way to aid the College monopolists, state that the Bill which passed the Lords was that of the Scotch Universities. We need not say, the Scotch Bill never got so far. Perhaps it was hoped that, by misrepresenting the fact, the fact itself could be averted.

The direct effect of this important measure is at once to

emancipate a numerous body of gentlemen, possessing the most honourable medical degree in the kingdom, from the stigma of being illegal practitioners. An indirect effect, arising out of the discussions in Parliament, has been to attract attention to the anomalous state of the profession, and to raise in the minds of the members of both Houses a strong conviction of the necessity of bringing in a comprehensive measure of Medical Reform. It rests with the profession to improve this opportunity.

In another part of this journal will be found the report of a very important case which was tried in the Mildenhall County Court a short time since. It appears that a poor woman—a domestic servant of a Mr. SEABER—broke her leg while engaged in the performance of her usual household duties, and in consequence her master sent off in a great hurry to Mildenhall, a distance of nearly eight miles, for the best medical assistance. Mr. HARRIS immediately attended, set the leg, and continued to watch the case until the woman recovered, at the end of five or six weeks. The moderate charge, for almost daily attendance, of £11 0s. 6d., Mr. SEABER refused to pay, and hence the legal proceedings, terminating, we rejoice to say, in the mulcting of this individual for the full sum claimed, with costs.

It is with great regret that we find, in so clear a case, two medical men—Mr. G. R. WILDE and Dr. PEARSON—not ashamed to come forward and aid Mr. SEABER in his attempt to repudiate Mr. HARRIS's just claim. We would remind these gentlemen of Lord BACON's aphorism, "That every man is a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves, by way of amends, to be a help and ornament thereunto." Gentlemen, however, who suggest that an industrious, hard-worked practitioner should be deprived of a just recompense for his valuable services, are by no means helps or ornaments to any calling.

It will be seen by a paragraph inserted elsewhere that the grocers are up again, and have been complaining to the Chancellor of the Exchequer of the recent prosecutions for palming off upon the public a mixture of chicory and coffee for genuine coffee, contrary to the statute, and speak of the law proceedings as "grievances" under which they labour.

But the public have also interests and "grievances" to urge in this matter, and we shall not fail to take care that these are also considered. There is but one straightforward and proper course to pursue, and that is, to sell chicory and coffee *separately*, at their respective prices, to all those who ask for those articles, and not to palm upon them an inferior for a superior article, and at the highest price.

UNIVERSITY COLLEGE, LONDON.—The prizes and certificates of honour for the summer term of the faculty of medicine, were announced on Wednesday. The prizes were awarded as follows:—*Botany*: Gold medal, Henry Maudsley; silver, William Pile.—*Pathological Anatomy*: Gold medal, Frederick G. Clarkson; silver, John D. Scurrah.—*Midwifery*: Gold medal, A. Stedman; first silver, J. D. Scurrah; second silver, Thomas V. Jackson.—*Medical Jurisprudence*: Gold medal, J. D. Scurrah.—*Materia Medica*: Gold medal, Henry Maudsley; silver (equal), Edwyn Andrew and James Gibbs Blake.—*Analytical Chemistry*: Williamson prize of £50 for chemical research, Robert Railton; honourable mention, George Kay and Henry Scringham. Mr. D. Boswell Reid, jun., stood next to the prizemen in the classes of pathological anatomy and materia medica, and obtained a fourth certificate of honour in botany.

## THE MEDICAL BENEVOLENT COLLEGE.

ON Saturday last, the council and friends of the College, to the number of about fifty, paid a visit to Epsom to inspect the progress of the building. The present unfinished condition of the structure gives but a most erroneous idea of what it will be when completed, and it would therefore be unfair to criticize it at the present moment. We may observe, however, that as far as the work has proceeded, it seems to have been conducted most admirably, the materials and workmanship being of a high degree of excellence. The site chosen for the building is picturesque, and commands a most extensive and beautiful view of the Surrey hills. The College is situated close to the road which leads from Epsom Church to Banstead, and is just about a mile from the railway station. The ground is dry, the formation being chalk. Water of an excellent quality, and in great abundance, has been procured by sinking a well to the depth of 145 feet. The College grounds are enclosed by a park fence, and comprise an area of about eighteen acres. This will be laid out partly as a playground for the boys, and partly as a park for the pensioners. The building is erected on a terrace on the slope of a hill, the portions already commenced presenting a frontage of 272 feet, and containing pensioners' house, master's house, dining-hall, (which at present will be used as the school-room,) offices for the institution, entrance-hall, class-room, dormitories for 100 boys, bath-room, servants' apartments, and the requisite domestic offices and corridors, the latter being fireproof. The rooms are spacious, lofty, and well-ventilated. The temporary school-room, which is a noble apartment, is of the following dimensions: thirty feet in width, fifty feet in length, and thirty-seven feet in height. The style of the buildings is of the fourteenth century; they are executed in brickwork, faced with red bricks, and Caen stone dressings. The amount of works at present contracted for by Mr. John Perry is £16,307. The architect is Mr. Edward N. Clifton. After taking a survey of the works, the company sat down to an excellent cold collation, which was served up in the temporary school-room. Mr. B. Oliviera, M.P., presided. Several excellent speeches were made, the proceedings being enlivened by songs from Mr. Crew. The company separated highly delighted with the day's employment.

## Correspondence.

"Audi alteram partem."

## THE MEDICAL PROFESSION AND LIFE ASSURANCE COMPANIES.

To the Editor of THE LANCET.

DEAR SIR,—Though we have heard so much lately from certain parties about THE LANCET being anything but friendly to the profession, after being for fifteen years a subscriber to it, I don't know where we country surgeons can apply in cases of difficulty, and receive the same amount of support to assist us in opposing the power of companies or individuals. If you think the enclosed correspondence will add one plank to the bridge which we intend building to carry us safely over, I shall feel proud.

I am, dear Sir, yours truly,

Fleggburgh, Norfolk,  
Aug. 5th, 1854.

JOHN T. WALLER, M.R.C.S. Eng.

To the Proposer's Medical Attendant.

July 22nd, 1854.

SIR,—A proposal having been made to this society for an assurance on the life of A. C—, Esq., and reference having been made to you for information respecting his present and general state of health, I am desired by the directors to request that you will favour them with answers to the following queries. Permit me to add that it is important for the party proposing the assurance that every question should be answered in as full and fair a manner as possible. As communications of this nature are considered to be strictly confidential, and as a reason for declining a life assurance is never assigned, a perfect reliance may be felt that, should the tendency of your answers be such as to induce the directors not to accept the proposed assurance, the purport of them will never be suffered to transpire, or to become in any way the subject of observation.

I am, respectfully, Sir, your obedient servant,

To John Waller, Esq.,  
Fleggburgh, Norfolk.

W. E. HILLMAN,  
Secretary of the Star Life Assurance Society.

Fleggburgh, July 26th, 1854.

SIR,—I will thank you to inform me what sum you intend paying for the information you require at my hands in relation to the life of A. C—, Esq.

Yours obediently,

To W. E. Hillman, Esq., Star Life  
Office, 43, Moorgate-street.

JOHN TURPIN WALLER.

July 26th, 1854.

SIR,—Herewith I enclose 10s. 6d. fee for your report on the life of A. C—, Esq., and will thank you to acknowledge the receipt of the same. Have the goodness to forward your report forthwith.

I am, dear Sir, yours truly,

To John Waller, Esq., Fleggburgh, Norfolk.

W. E. HILLMAN.

Fleggburgh, July 27th, 1854.

SIR,—Yours of the 26th came to hand, with the enclosed 10s. 6d., but I beg leave to say I intend to live by my profession, and shall therefore require for my advice the same reasonable sum I have received from other offices—viz., £1 ls. I am only sorry that I did not examine the list of paying offices published in THE LANCET, before I recommended my friend, A. C— (who is a medical man) to your company; but I had not the slightest idea that so respectable an assurance society, and one professing to make so much profit, would have wished to obtain a poor country surgeon's opinion for a mere bagatelle.

Yours obediently,

To W. E. Hillman, Esq.

JOHN T. WALLER.

N.B. Have returned the 10s. 6d., in case you should not consider my opinion worth more.

July 28th, 1854.

SIR,—I am in receipt of your favour returning the 10s. 6d. fee for your report on the life of A. C—, Esq., and am sorry that amount did not satisfy you. Our rule is, in common with many other offices, as follows:—When the amount to be insured is under £500, the medical examiner's fee is 10s. 6d.; and when £500 and upwards, £1 ls.

I am, Sir, yours obediently,

To John T. Waller, Esq., Fleggburgh.

W. E. HILLMAN.

Fleggburgh, July 29th, 1854.

SIR,—I received yours of the 28th, and am glad to hear of the safe arrival of the 10s. 6d. As there is no Act of Parliament to prevent, I can see no objection why I should not have my fee, as well as you have your rules; but setting that on one side, I do think it would require a large amount of logical acumen to prove whether the fee of £1 ls. should be paid for a surgeon's opinion when the sum assured is £499 19s. 11d., or when it is for £500. In conclusion, I beg to say that when you are inclined to pay the £1 ls. you shall have the best services of

Your obedient servant,

To W. E. Hillman, Esq.

JOHN T. WALLER.

July 31st, 1854.

SIR,—Mr. A. C—'s proposal has been laid before the directors, and they have postponed its consideration for twelve months, so that we do not now need your report.

I am, Sir, your obedient servant,

To J. T. Waller, Esq., Fleggburgh.

THOS. H. GRIFFITH,  
pro-Secretary.

## THE LATE INQUEST AND THE PROFESSION.

To the Editor of THE LANCET.

SIR,—It is really shocking to contemplate the animus displayed by many of the witnesses and some of the counsel against the Messrs. Wakley in the "late inquest." We hope such an inquiry as this may continue to hold the distinguishing title of "late inquest," and that another such may never be found to supersede it. How the jury found a plea to mix up Mr. Wakley, jun., in the verdict, I cannot find out, he being merely an assistant, and not responsible for the mistakes of another. Suppose the surgeon present, in an unaccountable manner, from some sudden insanity, had run a knife through the heart of the patient, would young Mr. Wakley have been made a participator in the foul act by a coroner's jury? This matter ought to be set right, for the mixing up of young Mr. Wakley in the verdict is most unjust. When Mr. Wakley undertook to ascertain the state of things, at the request of the surgeon, the child became so exhausted that he "thought it dangerous, and did not attempt to operate;" yet, under such

circumstances the jury mix him up with the result. God help a man from such juries! is my earnest prayer. No one is safe if such implication be allowed to pass unnoticed. The jury have found a verdict on insufficient evidence, or rather on no evidence at all, against Mr. Wakley, jun.; therefore they must have been prejudiced. I remember some few years ago being present at a case of lithotomy. The sound was introduced, and incisions made, and forceps used, but no stone was to be reached. These proceedings went on for thrice the length of time occupied at the Royal Free Hospital, and without success. Three medical gentlemen exerted their skill without avail, and then left the case in my hands. I immediately made out that the staff had passed down a false passage, and, having found out where the instrument had escaped from the natural passage, introduced it there, reached the bladder, and the stone was, with great joy, removed. The boy recovered, after being nearly three hours on the table, and under manipulation nearly all the time not of the most trifling kind.

I am, Sir, yours very faithfully,

Carlisle, July, 1854.

WM. REEVES.

*To the Editor of THE LANCET.*

SIR,—In common with all men who value their oaths at the College of Surgeons, I have been most thoroughly disgusted with the conduct of those whose demoniacal revenge prompted them to plunge the assassin's knife into the heart of our alma mater, rather than miss the chance of aiming a blow at the reputation of a brother whom they wished to injure.

That such a casualty has occurred to one of the first names in the annals of surgery, I myself have witnessed; and I shall never forget the intense feeling with which this great man explained to his pupils, after the post mortem, the nature of the accident which had occurred. "In a moment of anxiety the gorget had slipped between the bladder and the rectum, so that I had not entered the former at all," were his words. Two other surgeons of European fame like himself, both of them most successful lithotomists, did just what Mr. W. Cooke did, and perhaps more, when he failed in his attempts to get into the bladder. To the credit of my student days, there was no Judas at hand, who for private ends was base enough to attempt to bring punishment upon men who knew their duty, wished to do it, and would have done it, had it not been for the casualty of a moment, and of those moments which may occur to any man, and the more so the more anxious they are for their patient's welfare.

Wishing you to make what use you please of this communication,

I remain, yours truly,

Penhelyg-house, July, 1854.

JOHN PUGH, F.R.C.S.

**ROYAL MATERNITY CHARITY.**

*To the Editor of THE LANCET.*

SIR,—In perusing the contents of the resolution passed by the committee of the Royal Maternity Charity, as reported in your journal of the 5th inst., to the effect "that none of the charges made against Dr. T. L. Blandell's professional conduct were proved," created in my mind very great surprise, inasmuch as the main question at issue—namely, "that he purposely did go to the residence of the chairman of the committee, Mr. Norris, in 1852, and made to him an unconditional offer to undertake all the professional duties connected with the Charity for £100 per annum"—was unanimously admitted by the committee. Dr. Longstaff, the particular friend of Dr. Blandell, said at once, "We all know that." I therefore suppose the committee consider the fact of no moment; but as I am put prominently forward in this matter by them as one of the requisitionists, I distinctly impugn not only the consistency but the veracity involved in the resolution; in fact, the inquiry was a mere farce and pretence.

I am, Sir, your obedient servant,

August 8th, 1854.

JAMES BAMFORD.

**THE ASSOCIATION JOURNAL AND DR. CORMACK.**

*To the Editor of THE LANCET.*

SIR,—There are, I believe, but few members of the profession who will disagree with Mr. J. P. Wilding in his very proper remonstrance to Dr. Cormack, published in THE LANCET and Association Journal of Saturday last. I was not a little amused at reading Dr. Cormack's remark, in a note appended to Mr. Wilding's letter in the Association Journal, that he

"advocated not the cause of Mr. Gay," but the cause of the "Medical Protest Committee." Has it come to this—that Dr. Cormack has already thrown John Gay overboard, after having promised to undertake the advocacy of his cause! Was it not an arrangement that the Doctor should adopt John Gay as his protégé? Did he not communicate with Gay, asking him to become a member of the Provincial Association, and that he would advocate his cause? Was not that communication made to Gay between the 1st of February, (the date of Dr. Hitchman's letter, in which he asks if Mr. Gay is a member of the Association,) and the 14th of the same month? Was not Mr. Gay proposed by Dr. Cormack, and, at Dr. Cormack's request, seconded by the late Mr. Shepperd, Mr. Shepperd having no personal knowledge of Mr. Gay, although the proposers, by the rules of the Association, are required to have a personal knowledge of the candidate for admission to the Association? Did not Mr. Gay state, when asked if he was a member of the Association—"Oh, Cormack has advocated my cause so well, that I have subscribed to his journal?" Did not Dr. Cormack, in advocating the cause of Mr. Gay, convert the Association Journal into a sort of begging-box? In the second edition of the Journal of the 20th of January, it is stated that,—"The great expense attending the gratuitous issue of this edition is defrayed by a private subscription. Two gentlemen have, in the meantime, guaranteed to us the expense; but we hope that many friends of professional honour will remit five, ten, or twenty shillings to them (to our care), so as to relieve them from part of their pecuniary burden." Did not Mr. Gay furrage out an attorney, who was to furrage out a charge against two of his late colleagues, to gratify the rancour of the snipes and sneaks of modern days? and, after all, John Gay is cast off, and Dr. Cormack declares "he advocated not the cause of Mr. Gay." Oh!—

I would not, if I could, be Gay.

But, sir, the conduct of Dr. Cormack, as editor, has not only "tended to promote dissension in the Association and the profession at large," as observed by Mr. Wilding, it has done much more. The articles in the Association Journal are producing a low moral tone in the profession, they are *perfusum sane atioque veneno*. It is to be hoped the Doctor, in a fit of his religious zeal, will mend his ways before he receives his *exeat*.

Having no desire to appear in print, still, rather than be considered "a fictitious correspondent," I inclose my card, and remain,

A MEMBER OF THE PROVINCIAL ASSOCIATION.

P.S.—It has often occurred to me as rather a singular circumstance, that the editor of the Association Journal, the paid servant of the Association, should be also one of its rulers in the Council, for such is Dr. Cormack's position; besides, the Metropolitan Counties Branch is actually managed by him. It is his club. There are some curious rumours respecting the last election of the president-elect and councillors of the Metropolitan Branch. It is said that a certain aspiring physician to a West-end hospital, long a member of the Association, was passed over, because he is, in the opinion of a certain person, considered to be a private friend of Sir Charles Hastings. I may say more on this subject another time.

August 7th, 1854.

**THE CHOLERA.**

AMONGST the usually-received doctrines connected with the pathology of cholera, the following are perhaps as little to be disputed as any:—First, that the intestinal tract is the principal seat of the morbid action; secondly, that very many of the symptoms of the cold stage are dependent upon the loss of fluids from the blood; and thirdly, that the cramps are reflex spasms from irritation of the peripheral extremities of the nerves of the alimentary canal. Nevertheless it has been opposed to the first doctrine, that the most uniformly and conspicuously present phenomena are rather a suppressed or suspended secretion of bile, and congestion of the liver; to the second, that the stage of collapse is due to the congestion produced of the portal venous system and its associated organs; and to the third, that the rapid withdrawal of water from the muscles and nerves will better explain the occurrence of the painful muscular contractions. The opinions thus held relative to the essential influence of the hepatic system in the chain of choleraic symptomatic and pathologic phenomena have rather extensively influenced the therapeutics of the disease, as seen.

in the wide-spread trial of Dr. Ayre's plan of administering calomel in small doses very frequently repeated.

The cause of the pathologic changes along the intestinal tract must at present be referred (see Dr. Gull, in Report of College of Physicians) to a specific action of the cholera poison, operating through the blood. "A more minute account," says Dr. Gull, "we are as yet unable to give." Both the physical and chemical conditions of the blood have been attentively examined, the latter in particular, by Drs. Garrod and Schmidt, of Dorpat. Most observations go to prove that the physical condition is considerably altered in respect to its coagulability and its viscid and tar-like character; though an acute pathologist (Dr. Gairdner) avers that the circulating fluid is much less affected in its physical characters than is usually supposed to be the case. Schmidt's observations are highly interesting, and have special reference to what has been termed the *transudation stage*, or the separation—first, of the water and of the salts of the intercellular fluid, (of the blood;) and, secondly, of some albumen through the intestinal canal. This stage produces the true and characteristic stools of cholera, and has not, according to Schmidt, a longer duration than thirty-six hours. When at its height, the constitution of the blood is profoundly altered. Schmidt traces up all the phenomena of the disease to the starting point of transudation of serum-constituents. Dr. Parkes, in his analysis of Schmidt's observations, thinks this "is too limited a view, when judged of by the necessary test of clinical observation;" and, according to Dr. Gull, (*op. cit.*) some evidence received by the College Committee inclines to the belief, "notwithstanding the incompleteness of the data, that, although in a large number of instances the intensity of the symptoms is, in a general way, proportionate to the amount of the effusion; yet that this will only in part explain the attendant collapse which often appears to be, in no inconsiderable degree, due to the dynamic state of the ganglionic nervous system, induced either primarily by the poison, or secondarily by the lesions of the affected mucous surface." Admitting this, as also that the investigation of the *organic* constituents of the blood in cholera surpasses the present powers of organic chemistry, Dr. Parkes's observation is worthy of remembrance—viz., that our more precise knowledge of the steps of the transudation period points out that, if the diarrhoea (intestinal transudation) can be arrested in time, the other changes in the blood will probably become impossible, and thus the well-known practical rule of doing everything to arrest it receives scientific support.

The last accounts we have received of the devastations of the cholera in Barbadoes, show a decimation of at least 6000, and from the Antigua newspaper now before us we extract the following observations of interest:—

"Never having had any experience of it before in the island, the public and even the medical men were slow to believe that the deaths that occurred were attributable to the invasion of this dreadful disease, of the existence of which in any part of the West Indies there was no report, except in the distant island of Jamaica, where it had suddenly appeared some few weeks previously in Kingston. The only communication that had since taken place directly between the island and Jamaica was by one of the mail steamers, the *Derwent*, which arrived in Carlisle-bay from Jamaica, by way of St. Thomas, on the 21st., a week after the first cases that had occurred in Bay-street; so that they could not be traced to any infection brought by this vessel, though it is said that several of her men had died of cholera on the way up from Jamaica, and amongst them two natives of this place, whose clothes were brought on shore. If this is true, and that the woman who undertook to wash the clothes took the infection and died, it was only spreading the disease further, and perhaps adding to its virulence; it cannot be said to have originated it in Barbadoes. A gentleman (one of those who have been most active in visiting the houses of the sick—one of the city clergy) tells us, that having taken particular pains to inquire into the origin of the disease, he found it had first broken out in a wooden hovel in Jemmott's-lane, leading into Bay-street, near the General Hospital, occupied by a woman who was in the habit of buying flying fish, and cooking them for sale. Just about this time it is notorious that large quantities of these fish were sold in the mornings after they were taken, almost in a putrid state, along the Carénage; and this woman, no doubt, had poisoned herself, and helped to poison others, by means of these putrid fish. Even before the first cases occurred, we had heard persons complaining of the sale of these fish in a decaying state on the wharfs in the mornings, at such a rate as to induce the huckster women to buy them and cook them for food, to the great danger of the health of those partaking of them.

"Our contemporary of the *Globe* (who we are happy to find is convalescent after his recent attack of cholera) advises his Antiguan friends to take warning from what has occurred in Barbadoes—where the air became so foetid and impure around their burial ground, that the neighbourhood had to be deserted, and so infectious was the atmosphere, that two medical gentlemen driving by one evening were instantly seized with the cholera—that should the disease reach St. John's, and they persist in burying its victims in the heart of the town, not ten in a hundred of the citizens will live to deplore such an insane and suicidal proceeding."

As if Barbadoes was not already sufficiently afflicted, it appears, from well-authenticated reports from the first people in the island, that there is a great fear of absolute famine. Famine supervening on cholera—it is frightful even to think of it; and yet there appears good grounds for apprehension. There has been a long, dry season, amounting to a drought—ponds dry, lands parched and cracked, and what are termed ground provisions, such as yams, eddoes, &c., have been neglected in Barbadoes in the absorbing pursuit of sugar-growing. The small supply of these esculents available was used in an immature state. There are now scarcely any remaining, and great alarm is felt on the subject. A more gloomy picture of the best of our West Indian possessions has scarcely ever been sent home.

In France, the mortality, especially at Marseilles and Avignon, has been excessive, 500 a day having died in the latter city. At St. Petersburg and Constantinople the disease rages, indeed there is scarcely a portion of Europe free from the plague.

"Without any respect (says the *Spectator*), for human arrangements, or political distribution of territories, the cholera crosses the paths of armies and of navies, and scourges the invader or the rescuer. The same malady that cut off the songstress, Sontag, in Mexico, that drove back our ships from the shores of Cronstadt, now rages in the Piræus; the French hospital suffering severely, and the English soldiers not escaping. It is in Constantinople, and has appeared at Malta; it is settled at Varna and Smyrna; it is ravaging Italy. Florence "the Fair" is stricken not less than commercial Leghorn; and Genoa "the Superb," from whose streets of palaces, or narrow alleys of great mansions, those fly who can during summer, is a hot-bed for the pestilence."

With respect to our own country, we deeply regret to see the following prophetic remarks from the *Observer* are being rapidly confirmed,—"Our anticipations as to the advance of the cholera will be, we fear, but too soon realized. During the first two or three days of the past week the disease spread most alarmingly, especially in the parishes of Limehouse, Stepney, Poplar, Camberwell, Lambeth, and Bermondsey. In Camberwell alone there were in one day discovered 290 cases of premonitory diarrhoea. In fact, it may be stated that throughout the whole metropolis the premonitory symptoms are present. In Greenwich there never was so much diarrhoea known. Everything shows that we are on the eve of an outbreak of a far more terrible character than we have yet experienced. The wet and comparatively cold weather of the last three or four days has slightly checked the pestilence, but as soon as the weather changes, and we have a hot scorching sun, it will burst forth with renewed fury; as it is, we quite anticipate that the registrar-general's return for the past week will show a mortality from cholera of at least 250, and we should not be at all surprised if, at the end of five or six weeks, we shall have to record the mortality, not by hundreds, but by thousands. Neither is the cholera confined to London; on the contrary, it appears that all over the country the premonitory symptoms are prevalent, especially along the sea-coast. At Margate, Ramsgate, and all round the south coast, diarrhoea is almost universal. What the result will be when the hot weather really sets in God only knows, but we must confess to extreme anxiety on the subject."

Some fatal cases have occurred at Liverpool, and at Ludworth the disease has again made its appearance, an individual (name unknown,) who had come from Trimdon a few days before, having been attacked. The event, according to the *Durham Chronicle*, has caused the greatest alarm amongst the inhabitants. Five more deaths have occurred on board the *Lord Auckland* transport, making in all eleven deaths since leaving Gravesend. The crew remain on board the ship. The sick have been removed to the *Andromeda*; and the troops have been taken on board the *Endymion* and Government hulks.

Twenty-eight cases have occurred on board of the *Defence*, convict-hulk, and *Unité*, convict hospital-ship, at Woolwich, and eight of these cases have proved fatal. There have also been several cases on shore having a fatal termination; but singular to relate, the *Warrior*, convict-ship, stationed opposite the dockyard, has not had a single case on board.

The *Newcastle Chronicle* observes,—“We are sorry to state that cholera has appeared on board some of the Tyne colliers in the Thames. Intelligence has been received in Shields of two or three deaths—one, Mr. John Anderson, formerly a seaman's delegate, after eight hours' illness. The general health of the seamen on board of the vessels in Shield's harbour, we are happy to state, is good, and the health of the inhabitants of the two towns is very favourable.

Several fatal cases have already happened at the Millbank Penitentiary, and in the Tothill-fields House of Correction, and the last accounts stated fresh attacks to be occurring. In the metropolis, the low lying Surrey bank of the Thames, between the bridges and St. Aune's, Limehouse, are suffering very greatly. Children appear to be particularly liable to the disease in these localities, and are rapidly carried off. According to most practitioners, the pestilence is precisely of the same character as that of the autumn of last year, viz.—there is very generally a want of the intermediate stage. The case goes on at once from diarrhoea to collapse and death. There is, therefore, an additional reason for energetic action and early recourse to medical advice.

We have condensed the following from the official “Weekly Return” (metropolis) of the Registrar-General for the week ending August the 5th:—

Districts.	Population.	Deaths from Cholera.
Western (Kensington, &c.) ...	376,427	23
Northern (Marylebone, &c.) ...	490,396	12
Central (St. Giles, &c.) ...	393,256	14
Eastern (Shoreditch, &c.) ...	485,522	60
Southern (St. Saviour's, } Lambeth, &c.) }	616,635	290
		399

And of which 145 were under 15 years of age.

213 between 15 & 60 „

41 above 60 „

Though the disease is so severe in Bermondsey, (southern district,) yet from 40 to 50 interments are taking place weekly at St. James's Church, (adjoining the railway,) to the great horror of the inhabitants. This is too bad, and a deep satire upon that view of the question supported by the “Church,” which would enforce “fast days” and other ecclesiastical humiliation to avert the pestilence. Let warning be taken from Barbadoes, (see ante.)

From information received since the above was written, we may state that the *Asia* announces the continuance of cholera in New York, it having broken out amongst the Irish labourers at the Suspension Bridge at Niagara. The same vessel also brings account of the appearance of the vomit in the Havannah; and another ship, the *Lusitania*, tells of the destruction yellow fever is committing at Bahia and Pernambuco.

Mr. Borlase Childs, the surgeon to the City of London police-force, has written a letter to *The Times*, giving the following formula as a successful remedy:—For an adult it should be as follows, and should be had recourse to immediately on the supervention of the attack—thirty drops of laudanum and sixty drops of the common sulphuric ether, with a small quantity of peppermint-water. Half of the above quantity must be taken every four hours until the purging has ceased. The ether and laudanum should not be mixed until required for use, but should be kept in bottles with ground-glass stoppers.

## THE WAR.

(FROM OUR SPECIAL CORRESPONDENT.)

Camp, Devna, July 21th, 1854.

I SEND you a brief account of the present position of the leading division of the British forces in Turkey.

The plain of Devna, where the Light Division under General Browne advanced on June 30th, and where the brigade of cavalry had been previously encamped, is an extensive valley, nearly triangular in form, its greatest length being in a direction from north to south. The southern end forms the base of the triangle, and is lowest in level. It is here, at the south-eastern angle, that the lake, which reaches all the way from Varna, ends; and for a wide distance beyond, even at this dry season, the ground is an impassable marsh. This swamp encloses an area whose circumference is about eight or

ten miles, but in the rainy season it must occupy a much greater space. This is rendered evident, not only by the character of the soil, but also by the absence of any dwelling near this part of the plain, while, at the other end, there are numerous mills and houses.

At the base of a hill at the northern extremity of the valley a number of springs may be seen bubbling up, and the water thence derived is enclosed and banked up to a certain level, so as to form a reservoir. From this source, assisted by additions from various other springs in its course, arises a small stream, which passes along the whole length of the plain, and is finally lost in the marsh before mentioned. As this stream winds along, in consequence of there being a considerable fall from the north to the lake end of the valley, it acquires a certain amount of force, and this is taken advantage of for the purpose of turning the machinery of a number of flour-mills. No less than twenty-two of these mills are at present in active operation. I have no recollection of ever having seen so many wheels; each mill has two large water-wheels at work, wholly turned by springs, rising close to the mills themselves; for although the mountains which form the boundaries of the plain of Devna are broken into deep ravines and gullies, there is no instance of a stream or rivulet to be met with on their sides, nor any surface of water whatever. The springs rise wholly in the valley. The supply of water, the inhabitants say, never fails, and this is readily explained by the extensive mountain area, which, without any loss from evaporation, is thus drained. From this water is derived the supply by the troops for drinking and cooking purposes, and when obtained near the springs it is excellent in quality.

The mountains enclosing the valley of Devna, or Dewnos, as some maps have it, rise to about eight or nine hundred feet in height. They slope towards the plain on the south with an abrupt declivity; on the east and west, with a gradual inclination. Towards the north they are less elevated, and more broken. From the higher summits the fortifications of Varna and the vessels in the bay are readily seen on a clear day. They are covered with a thick scrub, especially towards their tops, but no large trees are seen. A few fields of rye and barley in the valley, and a few vineyards on the mountain sides,—the vine being cultivated in the same fashion as in Germany,—are the only cultivated spots seen. At the upper end of the valley are a few acres of vegetables; they chiefly consist of onions, but there are also beans, cabbages, cucumbers, egg-plants, vegetable marrows, &c., though in a very limited quantity. The onion appears to be the staple vegetable of the country; no potatoes are grown.

At a high elevation on the mountain side, and at the farthest end from the lake, is the village of Devna. The inhabitants are all Christian Bulgarians, and seem an inoffensive, industrious race. Weaving forms a constant occupation amongst the women while the men are away with their cattle or in the fields; and much more order and cleanliness is observed in the houses than in those of the Turkish villages. This appears to be the case generally amongst the Christian inhabitants in Bulgaria. At Devna the inhabitants want that healthy aspect that may be seen in other villages at a few miles' distance, which I am inclined to attribute to the generally unhealthy character of this locality from the neighbourhood of the lake and marsh. Four main roads pass from the plain. The road by the side of the lake to Varna, and its continuation in the opposite direction to Shumla, are two of these roads. Another road from Varna opens into the plain opposite to the village of Devna, crosses the stream by a small but substantial stone bridge, and, near the village itself, passes out of the plain to go to Silistria and Rustchuk.

The cavalry and the horse artillery are on one side—the eastern—of the stream before described; the two brigades of the Light Division, with the battalion of the Rifle Brigade attached, and a battery of foot artillery on the opposite side. The cavalry are encamped low down on the plain, but near to its upper end—a convenient arrangement as regards watering the horses; while the infantry are on a natural platform on the mountain side, at an elevation of 150 or 200 feet above the stream. The camp of the latter extends much nearer to the margin of the lake. I doubt if any medical officer was consulted in the selection of this site; it is certainly nearer to the swamp than is desirable. Fortunately the prevailing wind has been from the north and north-west, so that the influence of any malaria has hitherto been by this means escaped from. By a very little engineering, cutting a communication between the lower end of the lake and the bay of Varna, from which it is separated only by a very narrow belt of land, and by slightly embanking part of the Devna stream, the marsh might be drained, and the whole plain rendered healthy and fertile.

Since our arrival the temperature has been very variable, but as a general rule has been oppressively hot in the daytime, cool in the evening and at night. In the daytime in the shade for several days the thermometer stood at 92° Fahr., and twice it has reached 102° Fahr. in the shade, falling from 25° to 30° an hour after sunset. A breeze usually springs up three or four hours after sunrise, and continues through the day. When this has been absent, the heat has been most oppressive. With the exception of one or two thunderstorms, the weather has been clear and dry. The sun appears to exert a peculiarly scorching effect on the skin, so much so that men who have exposed themselves to it, whether while bathing, or washing clothes, or otherwise, have been temporarily disabled, by blistered backs, &c. Sores on the lips have been very frequent from the same cause, and sometimes on the lower lip, very troublesome to heal, from the numerous sources of irritation to which the ulcerated skin in that part is necessarily exposed.

Although there has been no small amount of fever, chiefly of an intermittent type, and of bowel complaints. For some weeks past diarrhoea has prevailed in the regiments of this division, the symptoms, in a few instances, approaching those of Asiatic cholera, but by the timely attention of the regimental surgeons and ordinary remedies, the disease, in the greater number of cases, has been readily checked. From the date of leaving Varna, the commissariat supplies have been most irregular; for days together nothing could be had but the bare ration of bread and meat, both, especially the beef, of an inferior quality; so that it has depended upon the zeal and activity of the commanding officers, often upon accident, whether any farinaceous or vegetable food could be got to mix with the meat, and to make it palatable or nutritious. The people of the country are now bringing onions for sale in abundance, and barley and rye-flour is to be obtained at the mills at a reasonable price. Moreover, during the present month, a ration of coffee and sugar has been added to the meat and bread, to form a morning meal, so that we may hope to get on better for the future. Beef amongst the natives is scarcely eaten at all, and only by the poorest; the ox and the buffalo are especially the beasts of draught of the country. Its flesh is therefore tough, dry, and by no means nutritious as compared with what it would be under other circumstances. Lamb, mutton, kid, and poultry of all kinds constitute the ordinary diet amongst the well-fed classes. Their cookery seems to be chiefly after the Italian style, the appearance of the dishes being modified by the necessity of having the meat divided into small pieces to make up for the absence of knives and forks, and to enable each *convive* to take his share out of the common dish. They are well-cooked and wholesome, however, which is the main point. In the Turkish regiments each battalion has its large cooking-tent to protect the fires and food from the rain and weather, and a whole company's mess is cooked in one large cauldron, just as ours is when a regiment is quartered in barracks. With us in the field the soldier has small means at his command for cookery, eighteen or twenty small camp-kettles per company of one hundred men being all his apparatus, and his fire on the ground, without any protection against weather. The company's cook has no easy task to make good soup in these eighteen pots, and *c'est le soupe qui fait le soldat*. Some cereal, with vegetable and condiment, ought always to be considered essential additions to the kettle of meat and water. By particular attention to the diet, there is no doubt a nominally small force may be kept as effective as a much larger force without such care; and the true effective state of an army cannot be told by the mere statistical detail of so many left behind sick in general-hospital, so many in regimental-hospital, &c. The strength of constitution, the power to resist morbid influences, if they should come, in short, the degree of health of those reported healthy, must be taken into account. We have not arrived at sufficient precision to show this by figures. Besides the want, hitherto, of a regular supply of good diet, another evil has been the inferior country wine which the soldiers have obtained from the canteens of the sutlers, who are generally Italians or Greeks, of by no means a very respectable character. Even a wholesome spirit would be less hurtful. Beer was promised in England, and large quantities were sent out, but all that the troops of this division have been able to obtain, (other divisions have contrived to be more fortunate,) since leaving England, has been three days' allowance of one pint per man. Medical officers have recommended it, commanding officers applied for it, but even at camp Aledyn, eight or nine miles from Varna, where a month was spent, and though there were ships full in the bay, none could be got. The cost of transport divided amongst the regiments would have hardly added any perceptible price to the porter when issued, if the commissariat transport failing,

they could have succeeded in getting it issued to them at Varna, and had been allowed to bring it on at their own expense. In some degree the absence of other supplies would have thus been counterbalanced, and the men fortified as well by the porter itself as by not spending their surplus pay in the trash dignified by the name of wine.

It has given general satisfaction to hear that the brigade of hospital conveyance carts is on its way; it will supply many wants. Pray that it may not be thought too great an innovation on peninsular customs. I regret that two divisions only are to be supplied; for, should there be an action, it is not unlikely that the carts and waggons would be more distributed than has been contemplated, and the value and efficiency of the brigade therefore not fairly tested. At present there is not a single conveyance for the sick here; those ordered to the general-hospital at Varna have to be conveyed by the return commissariat bullock-carts—machines of the most primitive and cumbrous description. On the occasion of a fractured tibia and fibula at Aledyn, the patient had to be carried on a stretcher, and nine miles over a bad road on a moonless night would have not been exactly what Mr. Pott would have recommended in such a case. However, if a similar accident were to occur to-morrow, no choice would be left but to adopt the same plan of carrying the unfortunate soldier to Varna. It would be much better than conveyance by a bullock-cart.

There have been two or three additions to the strength of the division by childbirth. It is strange how well the women of the different corps have borne up against all kinds of exposure. Well for them it is that they have had good health. Those regiments which made arrangements for not permitting any women to accompany them not only acted wisely and with forethought, but, as experience proves, most kindly to the women themselves.

## MILDENHALL COUNTY COURT.

JULY 25TH, 1854.

MEDICAL ATTENDANCE, ETC., ON SERVANTS.—ALDRICH AND HARRIS *versus* SEABER.

THIS was an action for recovery of £11 0s. 6d., the amount of plaintiff's bill for attendance on the defendant's housekeeper, who had broken her leg. Mr. Partridge appeared for the plaintiffs, and Mr. Salmon for the defendant. Mr. Eagle was the presiding judge.

JOHN SAKENS.—I was sent for by Mr. Seaber to go to Mildenhall for a doctor. He said I was to go for any doctor there was in the town. I was to get the parish doctor if I could, as he was generally reckoned the best doctor. I said, "Who is the parish doctor?" Mr. Seaber replied, "I don't know who he is, but call at the relieving-officer's; as you must pass his house, and ask him who he is." I called upon the relieving-officer, who told me where to go. *I did not ask for an order for the parish doctor, nor was I requested to do so.* I told the relieving-officer Mr. Seaber had sent me to get a doctor to attend Mrs. Winter, who had broken her leg.

FREDERICK HILLS HARRIS.—In August last, Sakens came to me to say I was to go to Mr. Seaber's to attend his housekeeper, who had broken her leg. He said Mr. Seaber had sent him. I attended her from the 23rd of August to the 26th of September. My charges were 10s. 6d. for each attendance—viz., 1s. per mile for a journey, and 3s. for attendance, which includes all medicines, lotions, &c., necessary for the case. I had to travel seven miles and a half into the fen. I also charged three guineas for setting the leg.

Cross-examine:—My partner and myself are the parish surgeons. There have been always two distinct medical districts, which are as distinct now as they were before the partnership. We each keep separate district report-books for the board, as we did before the partnership, by the request of the Poor-Law Commissioners. I never attended at Mr. Seaber's house before. I believe Mr. Pearson, of Ely, is his usual medical attendant. I have also heard of Mr. Robinson's attendance. I cannot say what passed between Mr. Seaber and myself when I first went to his house. When I am sent for by the master to attend a servant, I charge the master; I look then to the master for payment in every case. I had a conversation with Mr. Seaber on the 5th of September. I complained to him I had not sufficient assistance, wanting another nurse. He said I had better get some one from the union to attend as nurse. I told him I was not attending the case as parish surgeon. He said I was. I then told him I was not parish surgeon for that part of the district, and even if I was, I had no order from the relieving-officer. He said he should not pay

me. I consequently said I should not continue my attendance, and that he had better apply to some other medical gentleman. This was on the 5th of September. I advised Mr. Seaber to obtain surgical assistance by the 7th, when the case, at latest, ought to be visited again. I mentioned the circumstance, on my return home, to a legal friend, who considered I was bound to continue the case *throughout*, having commenced it, or I might render myself liable for damages, supposing the case not to do well afterwards. On the 7th, late in the day, I went to see if any other doctor had been obtained by Mr. Seaber, and finding from him no one had even been applied to to attend the case, I in consequence gave Mr. Seaber to understand that I considered myself both legally and morally responsible; and unless he would give me a written order *not* to attend the case further, I should resume my duties, and at his expense. He said he should give me no written order, and that I could do as I pleased about it, but that he should not pay me. I then went on to the end of the case. I applied at Christmas to Mr. Seaber for payment of the bill, but he objected to pay. He said he should not pay it except the County Court ordered it. I did not say it was a novel case, and that therefore I should take it into the County Court.

Re-examined.—My partner attends one district of the union, and I attend the other. My district does not include Mr. Seaber's residence. It is usual in the case of a pauper, after an order has been given, to attend such case, and to report it weekly to the board. I did not so report this case. I never attend a parish case without a written or printed order; if I did so I should not get paid.

Mrs. WINTER (defendant's late housekeeper.)—I was domestic servant to Mr. Seaber in August last. I met with an accident in carrying water; I was then in his service.

Cross-examined.—I sent for my master, and asked him to send for the doctor directly. I had £12 a year wages. I am a widow.

Re-examined.—Mr. Seaber never said I was to pay the doctor.

This was the plaintiff's case; and Mr. Salmon, then addressing the court on the part of the defendant, contended that he was not liable, Mr. Seaber only having done that which every master does in a case of illness in his family, and which would be done in few cases: if his Honour determined that masters were in all such cases liable to pay.

JOHN SEABER (the defendant) examined.—Mrs. Winter lived with me in August last. She broke her leg at that time. She sent for me, and hoped I would send for a doctor. I sent for Sakens, and ordered him to go to Mildenhall for a doctor. I told him to go to the relieving-officer, who would tell him what to do. I never gave Mr. Harris to understand I intended to pay him. He was a stranger to me. After the conversation on the 5th of September, Mr. Harris came six times to my house. He asked me if I was of the same mind as to paying him? I said I was. He replied it was a new case, and he should like to take it into the County Court.

Cross-examined.—When a parish doctor attends a case, I did not know it was necessary that the relieving-officer should give an order. I will not swear that I told Sakens to go for the parish doctor in this case, but I might have done so. I said if I had to pay this bill I should have a lot to pay. I never tried to shift the payment on to Mrs. Winter.

Mr. G. R. WILDE, Mildenhall, surgeon.—I have been in practice thirty-six years. I never considered I had a claim on the master when I was sent for to attend a servant, and I never make out a bill against the master in any such case, unless he undertook to pay.

Dr. PRASMON, of Ely.—When I am sent for to attend servants, I charge them, although sent for by the master, unless he previously undertakes to pay. It is not a customary or usual practice to do so; and when the servants could not pay, I lost the money.

Cross-examined.—I know nothing of this case. I was not sent for on the 5th of September to attend the housekeeper.

His Honour laid it down as clear law, that if a master sent for a doctor, he was liable to pay for the attendance; and it appeared clear by the evidence of Sakens, that he went to Mr. Harris as from Mr. Seaber, and which in fact the evidence of Mr. Seaber confirms. Not only in law, but in justice, did he consider the defendant liable; for he considered it very hard that medical men should not be paid when they are at the beck and call of any person who may choose to send for their assistance; and if they refused to go, they became subject to a general outcry throughout the country for their want of humanity and Christian feeling. With respect to Mr. Harris's attendance after the conversation on the 5th with Mr. Seaber, he should himself have considered it very unfeeling had the attend-

ance not been continued after finding that Mr. Seaber had not sent for other medical aid. He therefore considered the plaintiffs entitled to their claim for the whole amount, with costs.

The verdict, together with his Honour's foregoing observations, gave rise to expressions of much satisfaction throughout the court, which was very full.

## THE NEW MEDICAL REFORM BILL.

OPINIONS OF THE NORTH WALES BRANCH OF THE PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

In consequence of the suggestion of Sir John Forbes, M.D., F.R.S., &c. &c., that the new scheme of a Bill for Regulating the Medical Profession in Great Britain and Ireland should be submitted to the consideration of the North Wales Branch of the Association, a meeting of as many of its members as could conveniently be assembled accordingly took place, for the purpose of discussing its merits; the result of which was, that we, the undersigned members of the Association, and other practitioners, hereby record our united and unanimous opinions on the same.

1. That we consider the Bill not only inexpedient and perplexing, but probably injurious, by interfering with the existing medical institutions of the country, which we are fearful it is calculated much to embarrass, and even to subvert. The desirable object would be to place the whole of the universities and colleges upon the same footing—that they should enjoy the same immunities and privileges—be regulated by the same laws, and that supremacy should not be given to one more than another; this course is desirable rather than the framing of new institutions, or changing their governing bodies; and it is with regret we see in this new Bill that the old-established and venerable institution of the Apothecaries' Company is totally superseded, although it has been the means of raising the status of the profession more than any other institution, but requiring only a new nomenclature to give it that suitable dignity which it is so justly entitled to—the appellation of "The Royal College of Medicine."

2. That if, notwithstanding, it should be deemed expedient, by the majority of the medical fraternity, to establish a new institution, we freely concur with the general preamble of the Bill—viz., "That all properly-educated persons in the medical profession should be put on the same footing throughout the United Kingdom, and be free to practise all the branches of the profession in any and every part thereof."

3. But, passing over all the clauses from 1 to 12, we see no reason for abandoning the hitherto old-established period of the majority of the candidate for the fitness of his examination—viz., the age of twenty-one, and that he should be restricted to the age of twenty-two, the advantage of an additional year's delay not being commensurate with the inconvenience or economy of his protracted and expensive studies.

4. Clause 23. It is our opinion that the degree of "Doctor in Medicine" should be restricted exclusively to persons who have been long engaged in the practice of their profession—say ten years, and that it should be the *invariable insignia* or badge of *experience* only; and should not be awarded to *junior* candidates possessing merely rudimental or elementary knowledge, but to those having a *thorough practical* acquaintance with, and knowledge of, diseases, acquired not only in private practice, but in connexion with a public institution, as *honorary* surgeon for two or more years to an infirmary or dispensary; and that candidates under those circumstances should not be subjected to a second examination; but, if insisted upon by the *majority* of the senatus, then merely a written one should be sufficient, embracing strictly *practical* subjects; that a thesis should be written, either in Latin or English, (as the choice of the candidate may be,) upon any disease he may think proper to select himself, embracing some novel views from his own practical experience, paying the ordinary fee for the diploma.

5. That the same privilege, of granting the degree of "Doctor," be also extended to *surgery* and *midwifery*—each distinct and several as he may desire, according to the same routine of requirements as already laid down for "Doctor in Medicine," the one choosing for his thesis a *surgical* disease for his diploma of "Doctor in Surgery," and the other his thesis in *midwifery* for the "Doctor in Midwifery" degree.

6. We consider an *oral*, or, in fact, any other examination for any doctor's degree, whether medicine, surgery, or midwifery, in the case of an established practitioner, as humiliating and vexatious, after having had his knowledge previously attested to by a Board of Examiners, according to the regulations laid down by the Medical Council in this Bill, and also those of

the existing forms. Is there any necessity that he should undergo a second ordeal? Does it require a greater amount of professional skill to practise as a physician than as an apothecary or general practitioner? which of them sees the greater number of patients and diseases through all their various stages of progression? It is certainly the *general practitioner*.

7. It is a manifest absurdity to grant an M.D. degree to a young student with mere elementary knowledge, without long practical experience, and withholding it from the *senior practitioner*, who has had the full benefit of such attainments for many years and has already been legally pronounced competent to practise all the various branches of the profession; yet, under the existing regulations, this individual is subjected to a further examination, as though he had again become a *tyro*, and had lost all his former knowledge and competency by the lengthened labour and experience of many years' active and extensive practice, and perhaps grown grey in the arduous duties of his profession!

8. We would therefore respectfully recommend to the serious consideration of the Medical Council the propriety and justice of restricting the student to the *Bachelor's* degree only, whether in medicine, surgery, or midwifery, as already suggested, *any* or *all*, as his choice may be,—paying the prescribed fees accordingly; and reserve the *Doctor's* degree to the *experienced* and *practical* man alone. This arrangement would raise the status of the profession, and augment the pecuniary resources of the universities and colleges,—enlarge the safeguard and sanitary welfare of the community, and remove all invidious professional jealousies.

9. That, whether the existing institutions be undisturbed or new ones established in their place, we unhesitatingly submit that the foregoing arrangements should be seriously considered, and, if possible, be adopted in the *present* or the new institutions.

Finally, we venture to assert that there is no *supremacy* in medicine over surgery or midwifery, but that each branch possesses an equal importance with the other, and each should with equal justice enjoy its own individual distinction, namely, by conferring the *Doctor's* degree on each of the several departments to the *senior practitioner*, and that of the *Bachelor's* to the *student* only.

(Signed) P. WILLIAMS, M.D., L.S.A., President,

THOS. VICKERS, M.R.C.S., L.S.A.,	Members of the Association.
WM. PIERCE JONES, M.R.C.S. Eng., L.S.A.,	
AUGUSTUS AP HENRY PARRY, M.R.C.S.,	Non- Members of the Association.
J. C. ROBERTS, late Army-surgeon, L.S.A.,	
JESSE CONWAY DAVIES, M.R.C.S., JAS. WILLIAMS, M.R.C.S., L.S.A.,	

N.B. Those members of the Association who are favourable to the above resolutions (and other practitioners who are not enrolled members) are earnestly and respectfully requested to send in their names and addresses, testifying their approval and concurrence in the proposed measures with as little delay as possible, to the Secretaries of the North Wales Branch of the Association, viz.:—Edward Williams, Esq., M.D., Wrexham; and D. Kent Jones, Esq., Llangefni, Anglesea.

Holywell, June, 1854.

## GOVERNMENT AND THE SCIENTIFIC SOCIETIES.

### DEPUTATION TO SIR W. MOLESWORTH.

AN influential deputation, consisting of Sir John Shelley, Bart., M.P.; Mr. Heywood, M.P.; Mr. J. Heyworth, N.P.; Mr. James Bell, M.P., and representatives from the Botanical, Statistical, Pathological, Epidemiological, Ethnological, Entomological, and Philological Societies, and also from the Institute of Actuaries, had an interview on the 4th inst. with Sir William Molesworth, M.P., at the Office of Works and Public Buildings, in Whitehall-place, relative to their connexion with apartments in Burlington-house.

The deputation having been introduced by Mr. Howard, M.P., Sir J. SHELLEY stated that their object was to induce the Government to provide accommodation for the various literary and scientific societies under one roof. Having stated the good results which would follow from such a course being adopted, and other members of the deputation having expressed their views upon the subject,

Sir W. MOLESWORTH said that, without pledging the Government in any way, he might state that the subject of providing the various scientific societies with rooms at the Government expense had been taken into consideration. In conclusion, he stated that those societies who were about to be removed by the Government taking the apartments they at present occupy in Somerset House, would be entitled to the first consideration. The deputation thanked the right hon. gentleman for his courtesy, and withdrew.

## Parliamentary Intelligence.

### HOUSE OF LORDS.

MONDAY, AUGUST 7TH.

#### THE MEDICAL REFORM BILLS.

THE Duke of ARCYLL presented a petition from the President and other officers of the Queen's College of Physicians in Ireland, against the Medical Reform Bills lately introduced in the other House of Parliament.

TUESDAY, AUGUST 8TH.

#### PUBLIC HEALTH BILL.

Earl GRANVILLE moved the following resolution with regard to this Bill—"That as the Public Health Bill constitutes a new Board of Health, inasmuch as cholera exists in many parts of the kingdom, and various sanitary regulations which can only be carried out effectually by the said board imperatively are required, the circumstances which render legislation on the matter of the said Bill expedient are of such urgency as to render the immediate consideration of the said Bill necessary; and it is therefore reasonable that the same be allowed to be read a second time this day if the House shall think fit so to order."

The Earl of SHAFTESBURY bore his testimony to the urgency of the circumstances which called for legislation on this subject. The Board of Health, as at present constituted, would expire at the end of this session, and, as the cholera was advancing with such rapid strides, it was expedient that no time should be lost in reconstructing the department. The number of deaths from cholera and diarrhoea for the week ending August 5th was 547, being 399 from cholera and 148 from diarrhoea; and how the disease had advanced would be seen from the fact that, while from the week ending July 15th the deaths from cholera were 5, and from diarrhoea, 46—in all 51, for the week ending July 22nd the numbers were, from cholera 26, and from diarrhoea, 68—in all, 84; and for the week ending July 29th, from cholera, 133, and diarrhoea, 84—in all 217.

The resolution was then agreed to, and the standing orders having been suspended the Bill went through the remaining stages and was passed.

#### METROPOLITAN SEWERS' BILL.

Lord STANLEY, of Alderley, moved a similar resolution with regard to this Bill.

Lord REDESDALE said, that if proper diligence had been used the Bill might have reached their lordships' House some time ago. He did not believe that such a slovenly Bill had ever been sent up to the House; and he protested against the House being called upon at that period of the session to consider such a measure. He objected to the additional powers given in the Bill to create new works, and would therefore propose to omit all that portion of the Bill which was not a revival of the board.

Lord STANLEY, of Alderley, said, it was most important that additional powers should be given to carry on new works in certain parts of the suburbs, and hoped therefore the noble baron would not oppose those parts of the Bill which related to the creation of new districts.

The resolution was then agreed to, the standing orders were suspended, and the Bill went through the various stages and was passed.

### HOUSE OF COMMONS.

MONDAY, AUGUST 7TH.

#### PUBLIC HEALTH BILL.

The Public Health Bill was read a third time and passed.

TUESDAY, AUGUST 8TH.

## NORWICH LUNATIC ASYLUM.

Lord D. STUART asked the Secretary of State for the Home Department whether he had received a report from the visiting magistrates of the lunatic asylums in Norwich, containing the results of an inquiry by which it appears that justice was evaded on a criminal charge; and whether he would not direct a strict investigation to be made into all the circumstances of the case?

Lord PALMERSTON said, he had received no official communication on the subject, but his noble friend had two days since furnished him with some documents on the matter, which he had forwarded to the Commissioners in Lunacy for investigation, and he would communicate the result when he received it.

## MEDICAL REFORM.

Lord D. STUART asked the Secretary of State for the Home Department whether it was his intention to appoint a commission to inquire into the present state of medical education, and the laws regulating the practice of medicine, surgery, midwifery, and pharmacy in the United Kingdom; or to appoint a committee of the House of Commons for that purpose; and, whether, if a commission were appointed, it was to be composed of practitioners in medicine, surgery, midwifery, and pharmacy from England, Ireland, and Scotland, or those only practising in England.

Lord PALMERSTON had already stated his intention either of appointing a commission, or of asking the House to appoint a committee to inquire into the matter, with a view to the framing of some provisions for what was technically termed "medical reform." He should take such of these courses as upon consideration should appear the most effectual.

## Medical News.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, August 3rd, 1854.*

FOOTMAN, JOHN, Ipswich.

GORNALL, RICHARD GREGORY, Newton-heath, near Manchester.

LAMBERT, HENRY STONE, Croydon, Surrey.

LISTER, EDWARD, Liverpool.

MAY, EDWARD HOOPER, Tottenham.

**UNIVERSITY AND KING'S COLLEGE, ABERDEEN.**—At the August graduation at this University, the degree of M.D. was conferred on the following gentlemen, who were examined in the various branches of medicine, and found duly qualified:—

BOTHAM, JOHN C., Derbyshire.

COATES, WILLIAM, Somerset.

COLLINS, WILLIAM J., London.

FRASER, JAMES, Glasgow.

HILL, ALFRED, Birmingham.

HINCHLIFFE, MATHEW, Yorkshire.

JANNAHILL, ROBERT D., Glasgow.

JENKINS, GEORGE H., Wales.

MARR, GEORGE, Aberdeenshire.

PRING, JOHN, Bristol.

PROUDFOOT, THOMAS, Gloucestershire.

SEGAR, JOHN, Lancashire.

TATE, WILLIAM BARNY, Ipswich.

THORNE, GEORGE L., London.

On the following gentlemen the degree of M.B. was conferred:—

COLLINS, ALEXANDER, Stonehaven.

SMITH, ROBERT, Old Aberdeen.

**SOMERSETSHIRE SUMMER ASSIZES.**—*Cox v. CARRINGTON.*—This was an action for libel brought by Mr. Cox, a surgeon, at Bath, against Mr. Carrington, the proprietor of the *Bath Chronicle*. The damages were laid at £2000. The alleged libels were contained in comments which the editor of the *Chronicle* had made on the case of Bourn v. Cox, which was tried some months back in the County Court at Bath. It will be recollected that Mr. Cox was proceeded against for arresting a patient of the name of Bourn, just as he was about to leave England, for a debt of upwards of £20. He compromised the debt for £15, and was afterwards sued for

damages for the amount, on the ground that the bill supplied to Bourn had been made up by "attendances," &c., which were never given. The jury returned a verdict for £15. We commented strongly upon the case at the time; but it appears that in some political squabbles at Bath, Mr. Cox being one of the parties, the *Bath Chronicle*, the organ of his opponents, made use of the trial of Bourn to attack Mr. Cox. After a very lengthened inquiry, the jury returned a verdict of one farthing damages. The judge refused to certify.

**LYING-IN HOSPITAL, BIRMINGHAM.**—**GIFT OF DR. RADFORD.**—An adjourned quarterly board of this institution was held on the 26th ultimo. Mr. Arthur Heywood presided; and there were present, the Revs. F. B. Wright and R. Basnett, Drs. Radford and Whitehead, Messrs. S. Walker, James Ollivant, R. T. Hunt, and other medical officers of the institution. Dr. Radford stated that, from the interest he took in the institution, and wishing to see it advance in scientific knowledge and usefulness, he had resolved to present his museum and library to the charity, on certain conditions. In the first place, the present institution was inadequate to its reception. The canvas for funds to erect a new building was progressing favourably in the hands of the ladies, and to assist their object he should stipulate for two suitable rooms, one for the museum, and one for the library. His library was not what he should call one of the fullest general medical libraries, but in the especial department of the institution, that of obstetric medicine, he considered it very good; and it was his intention, though he should make no pledges, to increase it, as far as he was able, during his life. He had made a provision in his will for this gift, but he thought it better to bequeath it to the institution while living, in order to see the good resulting from it. His next condition was induced from his having been personally observant of the waste and destruction that had occurred in one munificent gift to the institution, namely—the museum of the late Mr. Charles White. But gentlemen must be aware that there were other grounds why means should be taken to preserve the gift; and he therefore required that a report should be made at each quarterly board as to the state of the preparations in the museum, the condition and safe custody of the books; and that there should be an annual inspection of the same by two or three persons, one of whom to be a medical officer of the institution, who should inspect and report upon the condition of both the museum and the library. Third, that the apothecary be appointed the librarian and the resident curator, who was to be responsible to the board for the safe custody of the museum and library. Fourth, to have a list of rules, based upon liberal and safe principles, to govern the circulation of the bulk of the books; and also to put restrictions upon the use of those of large size, containing plates, and which were only intended for reference. Fifth, to have rules to regulate the circulation of books amongst pupils, with guarantee and deposit paid for their safe return. The sixth condition would have reference to the question of investment in the hands of trustees. These conditions were, he considered, unselfish, and were imposed to further the interests of the institution, and especially of the medical staff. The last condition, and which might be considered a selfish one, was that Mr. Winterbottom, a nephew of his by marriage, a surgeon of the institution, and to whom, had he not presented his museum and library to the hospital, he should certainly have bequeathed them, should have free recourse to his gift at all times.—The Chairman thanked Dr. Radford on behalf of the meeting and the directors of the institution, for his extremely liberal and kind donation; and said he had no doubt the handsome gift would prove most extensively useful to the hospital. He was sure that the conditions imposed would be most willingly and thankfully complied with.—Dr. Radford said it was his wish, and that of his associates, that this institution should rise in scientific knowledge. The trustees of the institution must have a very narrow view of its objects, if they considered them to be limited to the sole object of relieving suffering humanity. The objects of the institution ought to be scientific, and then, of course, its advantages would be reflected in a double manner, first upon the poor, but also in an especial manner upon the rich.—The Rev. F. B. Wright proposed:—"That the warmest thanks of this board be given to Dr. Radford for his munificent gift to this charity of his valuable museum and library, powerfully adding, as they will, to the means which the hospital already possesses of affording instruction to medical pupils in the class of diseases which it is the immediate object of the hospital to relieve."

**CHICORY AND COFFEE.**—"GRIEVANCES" OF THE GROCERS.—A numerous deputation of the metropolitan grocers, attended by Sir James Duke, M.P., Mr. Williams, M.P., Mr.

Apsley Pellatt, M.P., and Mr. Moffatt, M.P., had an interview with the Chancellor of the Exchequer, on Wednesday, the 2nd instant, at his official residence in Downing-street. The deputation was introduced by Sir James Duke, M.P., and the grievances of the grocers, in regard to the late prosecutions for the sale of coffee and chicory, were stated to the Chancellor of the Exchequer by Mr. Moffatt, M.P.

**CREAN v. CLIFT AND OTHERS.**—This was an action for libel, published in the *Wolverhampton Chronicle*, imputing to the plaintiff, a surgeon, that he had caused the death of a person named Clift. The defendant pleaded, firstly, "not guilty," and, secondly, "justification." The plaintiff is a surgeon at a place called Brewood, near Wolverhampton, and held a diploma of 1846 from the Dublin College. He came over here to a relative of his, a Mr. Mc Munn, practising at Brewood, but, after a short time, he returned to Ireland to an hospital appointment at Ballynary for two years. He then came again to Brewood. On the 28th of May, a farmer named Clift, aged seventy-one, broke his arm, and the plaintiff was called in on the following day to attend him. According to the plaintiff's account he reduced the fracture properly, but in consequence of the patient's great age, the bones did not unite, and at the end of seven weeks the splints were taken off. He and a Mr. Edwards, another surgeon, met in consultation the following day, and the splints were put on again. Mr. Crean continued to attend him occasionally. He died in October from a carbuncle. Both before and after death a great deal of scandal went the round of the neighbourhood relative to the alleged maltreatment by Mr. Crean. A post-mortem examination was made, conducted by Mr. Edwards's partner. On the day after this, there happened to be a meeting of the medical and surgical officers of the South Staffordshire Hospital, and Mr. Crean, including Mr. Edwards, submitted the arm to their examination. These gentlemen consisted of Dr. Topham, Dr. Millington, Mr. Cartwright, and four others, who declared that they were unable, in the absence of positive proof, to come to a satisfactory opinion of the case. After this Mr. Crean called upon Mr. Edwards to retract what he had said previously about him, and upon the latter declining, Crean held a whip over Edward's head, and told him "to consider himself horse-whipped." An angry and lengthened correspondence then ensued in the *Wolverhampton Chronicle*, and at last the libel appeared which formed the subject of the present action, in the shape of a letter from the defendants, stating that they came forward in justice to Mr. Edwards, and that the statements of Crean were utterly devoid of truth, and that he (Crean) had suffered the arm to remain for seven weeks without examination, and that, instead of a beautiful union of the bones, Mr. Edwards had measured the arm and found it one inch shorter than the other. It was stated that Mr. Crean was nervous at the time he operated, when setting the arm, and that he trembled. The letter, in substance, also insinuated that the death of the old man was occasioned by the maltreatment. A number of witnesses, medical, surgical, and otherwise, were called on each side, and the arm was produced in court. After considerable deliberation the jury eventually found a verdict for the plaintiff, damages £25.

**CARLISLE INFIRMARY.**—The bishop of the diocese ably and eloquently advocated the cause of the charity at the cathedral on Sunday last, when his lordship said the receipts left £500 against the Infirmary; and that, as the price of the necessities of life and medicine had increased twenty per cent. in price, those liabilities would be further increased unless the friends of humanity hastened to the rescue of the institution. At a subsequent meeting of governors it was resolved to make a general appeal to Cumberland on behalf of the infirmary.

**HONOURS TO MEDICAL MEN IN FRANCE.**—In 1853, the first number of the *Annuaire de l'Ordre Imperial de la Legion d'Honneur* was published, and it contained 52,709 names, thus distributed:—Family of the Emperor, 3; Grand Cross, 57; Grand Officers, 214; Commanders, 997; Officers, 4633; Chevaliers, 46,805. The *Gazette des Hôpitaux* has examined this record for the purpose of ascertaining in what proportion medical men and members of the Institute figure in it. It results, that in the class of Grand Officers there are six members of the Academie des Sciences; and in that of the Commanders twelve medical practitioners, and seven non-medical academicians. In the list of Officers there are 140 medical men, ten pharmaciens, and thirteen members of the Academie des Sciences; in this class is also found the name of M. Charrière, the celebrated surgical instrument-maker. In the class of Chevaliers there are 1698 medical men, and 128 pharmaciens, besides ten members of the Academie des Sciences, and eighty-seven veterinary practitioners. Taken

altogether the medical members of the Legion amount to 1850, divided as follows:—Military, 867; marine, 233; civil practitioners, 750. The total of the pharmaciens is 138, divided into 109 military and 29 civil. Some may consider the distribution of orders as too profuse in France, but there can be as little doubt that it is too parsimonious in our own country, and with us the encouragement and reward of the medical body by its means is well-nigh altogether neglected.

**ST. MARK'S HOSPITAL.**—Last week the eleventh anniversary of the Auxiliary Branch of this charity was celebrated at the Highbury Tavern, H. Barnett, Esq., in the chair. The Chairman, Dr. Daniel, and Mr. Salmon, (the founder,) eloquently advocated the cause of the charity, which, when established in 1835, only afforded accommodation to 14, but now had 70 patients within its walls.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, AUGUST 5.**—In the week that ended last Saturday, the total number of deaths registered in London, was 1456. In the ten corresponding weeks of the years 1844-53, the average number was 1087, which, if raised in proportion to increase of population, becomes 1196. The present return, therefore, exhibits a mortality considerably in excess of the average; a result arising from cholera, which it will be observed with regret continues to make progress in the metropolis. The deaths ascribed to the zymotic or epidemic class of diseases rose from 422 in the previous week to 731 in the last. Cholera, which was fatal in the last three weeks of July in 5, 26, and 133 cases, destroyed last week 399 lives; viz.—145 children under fifteen years of age, 213 persons between fifteen and sixty years, and 41 who had reached sixty years of age and upwards. The disease had made greater progress at the same date in 1849, for in the week that ended 4th August of that year, the number who died of it was 926. From diarrhoea and dysentery the deaths in the last four weeks have been 51, 63, 87, and 146.

Last week the births of 776 boys and 727 girls, in all 1503 children, were registered in London. The average number in nine corresponding weeks of the years 1845-53 was 1364.

At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 29.701 in. The mean temperature was 58.5°, which is 3.7° below the average of the same week in 38 years.

## Obituary.

**M. LALLEMAND**, formerly professor at the Medical Faculty of Montpellier, member of the Academy of Sciences, and officer of the Legion of Honour, has just died at Marseilles. This distinguished member of our profession has acquired a world-wide reputation by several works of importance, amongst which we may cite the "Letters on the Encephalon" and the treatise on Spermatorrhoea. We shall shortly give our readers a detailed account of M. Lallemand's career.

**SUICIDE OF DR. GRAHAMSMLEY.**—WORCESTER, MONDAY.—The most profound sensations of surprise and regret pervaded this city this morning, from intelligence received at an early hour that Dr. Grahamsmley, the medical (in fact, the) superintendent of the Worcester City and County Lunatic Asylum at Powick, had committed suicide by taking prussic acid. Dr. Grahamsmley was in Worcester on Saturday last, in his usual health and spirits; and up to the time of writing no cause is assigned for the melancholy deed. The doctor is a Scotchman by birth, and was appointed to the Asylum at its completion about two or three years ago. He was greatly respected in this city.

On the 3rd instant, JOHN WAKKHAM EDWARDS, Esq., surgeon, of Hart-street, Bloomsbury-square, aged sixty. In Athlone, Dr. JAMES D. KELLY.

## BOOKS RECEIVED FOR REVIEW.

Weber's Clinical Handbook of Auscultation and Percussion. Translated from the German by Dr. J. Cockle.  
Dr. A. W. Clarke on Diseases of the Lungs.  
Mr. I. B. Brown on some of the Diseases of Women.  
Dr. Muspratt's Chemistry. Part VIII.  
Dr. Ayre on Epidemic Cholera.  
Sketch of the Life and Character of Dr. Abercrombie.  
Report of the Grant Medical College, Bombay, 1853-54.  
Dr. D. Noble's Lectures on the Correlation of Psychology and Physiology.  
Professor Hofmann on Harrogate and its Resources. A Chemical Analysis of its Medicinal Waters.

## TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under.....	£0 4 6	For half a page .....	£3 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

## TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... ..	£1 14 8
Six Months ... ..	0 17 4
Three Months ... ..	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET OFFICE, 423, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

*Horatio*.—Such attacks upon the profession in lay journals can scarcely be wondered at, when medical periodicals set them so bad an example. To gratify personal spite, or to injure a rival, there is no baseness to which they would not stoop. We are obliged for the extract forwarded from *Tait's Magazine*; but such slanders against the profession are too contemptible to be noticed with seriousness.

*Dr. J. A. H.*.—1. The assistant-physicians in the London hospitals have not beds allotted to them for patients. Their duties are confined to prescribing for out-patients, and officiating for the physician when called upon in his absence.—2. We are unacquainted with any precedent for the appointment of a person who keeps a shop and dispenses medicines to the post of physician to a hospital.—3. There is no hospital, we believe, in London at which the assistant-physician receives any portion of the fees derived from pupils.

## THE VERDICT IN THE RICHARDSON INQUEST, AND RESPONSIBILITY OF OPERATING SURGEONS.

To the Editor of *THE LANCET*.

SIR,—Nearly a year ago the following query was discussed at the Medico-Chirurgical Society of this town; and, as it bears closely on the question, so deeply affecting our profession, that has been raised by the verdict given in the late inquest on the boy Richardson, I take the liberty of sending it to you.

I am, yours respectfully,

Aberdeen, July, 1854.

AMICUS.

"*QUERY*.—In a surgical operation, in which two or more medical men are concerned, where does the credit or the responsibility of the result rest?"

"*ANSWER*.—It is customary and proper, before the performance of any serious operation, that the patient or his friends should express, not only their acquiescence in it, but also their entire resignation as to the issue; so that the very fact of an operation, under these circumstances, being decided on, virtually amounts to an absolution of the surgeon from all penal and moral responsibility as to the result; provided always, of course, that the procedure do not conduce to some illegal object, and no culpable unskillfulness be committed in the conduct of it.

"If the case belong to the person who has the direction, and performs the chief part, of the operation, and who has had the free choice of his assistants in it, the entire credit or responsibility, in as far these may with propriety be attributed to any one, ought to be considered as his.

"In the event, in private practice, of any such malpraxis being committed as might entitle the patient or his friends to legal redress, these, it is presumed, could have their recourse only against the principal operator, inasmuch as it was to him that the case was entrusted, and that without their interference as to the choice of the measures necessary to be used, and it is a recognised maxim in law, that '*qui facit per alium, facit per se*.' On such an occurrence happening in an hospital or similar public establishment, the institution itself would be the legally responsible party.

"In the case of a sudden emergency or accident, requiring the immediate employment of surgical means, the credit or responsibility will be shared, to a greater or less extent, by all the medical men who happen to be at hand, and who give their aid, whether by consultation or by manual operation, in the case."

*A Member of the Provincial Medical and Surgical Association*.—Such a question may be put with great propriety at the meeting at Manchester.

*A. B.*.—Complaints of a similar kind have reached us from other quarters. The remedy for such an abuse is in the hands of the persons defrauded.

*D. M.*.—Much would depend on the previous position of the patient to the surgeons. If he was A's patient on former occasions, B's conduct was wrong, and he ought not to have attended. If the patient was unknown to either of the surgeons, B claims the patient by "*night and right*."

*Another Student* (Manchester Infirmary) has forgotten to authenticate his communication.

*Amicus*.—Declined at present.

*Q. S.*.—The assistant is not in any way responsible.

*Junius*.—The advantages are great at the institution named. We do not know the fee.

*An Assistant-Surgeon E.N.*.—1. The chief difficulty in obtaining such an appointment is the want of interest.—2. In future the candidates for assistant-surgeons in the East India Company's Service will have to compete for the office. It has not yet been made public in what way the examination will be conducted.

*H. F.*.—Information on all the points will be found in the *BRITISH MEDICAL DIRECTORY*. If there are further particulars required, we shall be happy to supply them on receiving a request from our correspondent.

*An Old Reader*.—1. Both universities stand well in public estimation.—2. Not under the present charter.

*A Fellow of the Society* will observe that the subject is noticed in another part of this day's *LANCET*.

*A. B.*.—If the particulars be forwarded, they shall receive our earnest attention.

## QUERIES REGARDING COCCIVUS'S OPHTHALMOSCOPE.

To the Editor of *THE LANCET*.

SIR,—An instrument, called Coccivus's Ophthalmoscope, for illuminating the interior of the eye, and rendering visible, it is said, the retina, having fallen in my way, I have been trying what I can make of it; but have not hitherto succeeded in seeing anything with it, except a general glare from the bottom of the eye, when the pupil happened to be wide.

The instrument consists of a small square plane mirror, with a hole in the middle of it, and a double convex lens, the use of which is to condense, as I understand, the light of a lamp or a gas flame upon the mirror, whence, being reflected into the eye to be examined, it is to be reflected back, through the hole, to the eye of the observer, which is of course to be placed behind the mirror.

If any of the readers of *THE LANCET* have used the instrument successfully, perhaps they would be kind enough to give a few directions how it is to be employed, explaining the following particulars:—

1. The relative positions which should be given to the lamp, the patient, and the observer.

2. Whether the mirror and the condensing lens should be placed parallel to each other, or at an angle, and at what angle.

3. If the lens and mirror are placed at an angle, whether the observer should look through the lens or not.

4. Whether the mirror should be held at an angle to the observer's eye, or parallel to it.

I am, &c.,

Glenniffer-place, Paisley, Aug. 1854.

SPECULATORIUS.

*Mr. Stephen Ray*.—We think it quite superfluous to revive a discussion which the common sense of mankind has long since settled. The employment of old women in obstetric practice is a relic of barbarous times.

*Erinny's*.—A correspondent under this signature suggests, in an able letter on the English Lunacy Acts, for which we have not space:—

"1st. That the new Commissioner in Lunacy, when such is required, be a Scotchman."

"2ndly. The new Commissioner should have had no experience in the management of a public asylum, or in the treatment of the insane generally."

"3rdly. Let the new Commissioner be not more than three or four years distant from the age which marks the scriptural termination of the life of man."

"4thly. It is very desirable that the new Commissioner should be able to write English prose with a fair degree of accuracy."

*A Friend to Decency*.—It would be attaching too much importance to the quackish print to notice it in the pages of *THE LANCET*. The bubbles have long since burst.

*M.D.*.—As yet no plan has been published by the Directory.

*A City Man* has written to us, stating that the police are in the habit of throwing a number of dead dogs daily into the Thames at London-bridge. Our correspondent says that two or three days since he saw no less than eight dogs lying on the bank in a state of putrefaction. Is it possible that this practice can be permitted, when numbers of human beings are now dying from cholera close to the very spot?

## SANITARY REFORM.

To the Editor of *THE LANCET*.

SIR,—Believing you take much interest in the sanitary reform of the metropolis, I beg to state I have devised a scheme to carry off the whole sewerage of London from the Thames, and convert it into manure by the amalgamation of pest charcoal, which would be useful for agricultural purposes; and I solicit your assistance, by pointing out to me any numbers of your own journal or any other periodical which treat upon the subject. You may also be able to tell me the name of the medical gentleman that made an analysis of the London sewers' contents some time since, and estimated the value of the substance annually wasted.

By affording any information on this subject, you will probably be the means of doing a public service, and would, by answering this note in your Correspondents' column, confer a great favour on,

Your most obedient servant,

Sunnybank Villa, Purlick, near Glasgow,

J. F. W.

July, 1854.

*ERRATA*.—In Mr. Charles Neate's paper on "*Hæmatemesis*," in the last number of *THE LANCET*, page 101, the dose of tincture of sesquichloride of iron should have been *half a drachm*, not a *drachm and a half*, as printed. The exact same error occurs in the dose of turpentine ordered, which should have been *half a drachm*.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. J. McBean, (St. Andrew's, with enclosure); Mr. R. Baydon, (Methley, with enclosure); Mr. W. Locke, (Hoddesdon, with enclosure); Mr. John Wible, (Southampton, with enclosure); Mr. S. K. Burch, (Merthyr, with enclosure); Mr. H. W. Lewis; Mr. J. Carlile, (Stockport, with enclosure); Dr. Smyth; Mr. J. Warwick, (Salisbury, with enclosure); Dr. Fyfe, (Aberdeen, with enclosure); *Horatio*; Another Student, (Manchester Infirmary); *Amicus*; Mr. Hamilton; Mr. Bamford; Mr. Harvey, (Dublin); A Member of the Provincial Association; *Junius*; Q. S.; *Cyuro*; *Speculatorius*; H. F.; Mr. J. F. Waller, (Fleggburgh, Norfolk); *Veritas*; An Assistant-Surgeon R.N., (Baltic Fleet); Mr. J. Pugh; Mr. Chas. Neate, (Uttoxeter, Staffordshire); *Medicus*; Mr. Giles; A Medical Reformer; Mr. Weston; M.D.; A Sincere Sympathiser with the Injured; Mr. W. Reeves; D. M.; F. B.; A Friend to Decency; Mr. Ikin; Dr. J. A. H.; A. B.; An Old Reader; A Fellow of the Society; Mr. Stephen Ray; *Erinny's*; A City Man; &c. &c.

## New Urethrotome, by Mr. Ure,

Surgeon of St. Mary's Hospital, described in *THE LANCET* of June 10th, 1852.—Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

## Darby and Gosden beg to call

the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.

140, LEADENHALL-STREET, CITY.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

**FIG. 1. THE BELT AND AIR-PAD FOR FEMORAL HERNIA.**—Mr. Bourjeaud begs to state that this has been extensively tried, and has met with great approbation, especially at Guy's and St. Bartholomew's Hospitals. (See *THE LANCET*, Jan. 10th, 1852, page 43; and March 13th, 1852, page 287.) The air-pad is carefully adjusted, so that it may exactly rest on the femoral ring, the tube and stopcock being free, to allow of the pad being subjected to more or less insufflation. The belts in all these apparatuses possess the great advantage of encompassing the abdomen without distressing the patient, and of giving such support to the intestines as to lessen the chance of hernial protrusion. It is, in fact, extremely erroneous to confine the pressure to the rings; the whole abdominal mass should be well supported, and the pressure on the rings will then be effectual, without being exerted with the violence so often connected with the steel trusses.

**FIG. 2.—APPARATUS FOR UMBILICAL HERNIA.**—The belt is of the same kind as those figured in the other diagrams, but an air-pad sufficiently large is here fixed to the centre of the belt, and has the advantage, by its yielding and resilient properties, to fill, in some degree, the umbilical ring; thereby preventing protrusion, and leading the way, especially in children, to the final closure of the ring. Mr. Bourjeaud has had several cases of radical cure with young subjects. (See *THE LANCET*, July 12th, 1851, page 33; and Feb. 12th, 1853, page 153.)

## India-rubber Urinals for Male and FEMALE RAILWAY TRAVELLERS AND INVALIDS.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

URINAL FOR BED USE.  
Price 15s., 18s., and 21s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

GREAT REDUCTION IN PRICE OF

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED  
FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

IMPORTANT TO THE MEDICAL PROFESSION.

## Davenport's Syrup of the Iodide of QUININE AND IRON.

FROM DR. GOLDING BIRD.

"48, Russell-square.

"I have now for some time employed pretty largely the triple Compound of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the form of Syrup. I do not hesitate to express my opinion of its great value as a therapeutic agent. It has appeared to me that the Quinine assisted the assimilation of the Iron, and I have found it to be of very great value in cases in which the use of the Iodide of Iron is recognised. This triple Compound possesses many advantages over the simple Iodide, and not the least of them is the satisfactory manner in which it is tolerated by the stomach, especially if administered (as all preparations of Iron ought to be) immediately after a meal.

"GOLDING BIRD, A.M., M.D., F.R.S.

"Fellow of the Royal College of Physicians.

"Physician and Professor of Materia Medica, at Guy's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with confidence testify to its marked efficacy in cases of Struma and Anæmia, and, indeed, in all instances in which the exhibition of Iron and its Compounds is indicated. This preparation appears to combine all the therapeutic powers of its constituents, without their nauseous qualities, which renders it an admirable medicine in the treatment of some of the disorders of Childhood.

"Maldon.

"Geo. P. May, M.D."

SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Insipissation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 25 per cent. of Quinine. 4s. 6d. per oz.

SYRUP OF THE IODIDE OF IRON (P.L.), 3s. per lb.

BI-MECONITE SOLUTION OF OPIUM. Professional testimonials acknowledge this preparation to be the most efficient sedative extant. The unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30 Drops. 8d. per oz.

COTYLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and 1s. per oz. also the Preserved Juice, 5s. 4d. per lb., as recommended by Mr. Salter, (of Poole), in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, GREAT RUSSELL-STREET, BLOOMSBURY.

## Soyer's Aromatic Mustard. — "M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration." — THE LANCET.

Sole Agents: Messrs. CROSE and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

**PRESERVING HEALTH.**—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Cocoa of the finest quality, prepared

in the best possible manner. — Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 8d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids: much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes, — light for supper, — and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Do you bruise your Oats yet? — New

Oat-crushers, £2 15s., £4 5s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s. — WEDLAKE and Co., 119, Fenchurch-street, — One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## George Hanson's Sparkling Hop

CHAMPAGNE, Quarts 18s., Pints 12s., Sparkling Nectar, 8s., bottles included; Hampers, 1s.

This new and exhilarating beverage, possessing the fine aroma and pure tonic properties of the Hop, with all the brilliancy of the foreign Champagne, stands unrivalled as a luncheon and dinner luxury. To Invalids it is invaluable, and can be taken without affecting the head — its habitual use assisting the digestion.

To Merchants and Captains it will be found an excellent article for Export — to Passengers in sea-sickness this restorative will be highly appreciated — it will be found a cool and refreshing drink at the Mess Table — and in Warm Climates most desirable.

G. H. has the greatest confidence in recommending the above, and the demand, which its excellence has created, is sufficient guarantee of its quality.

May be had at most of the Taverns and Refreshment Rooms in the neighbourhood of the Crystal Palace.

Sold Wholesale, Retail, and for Exportation, by the Manufacturer, GEORGE HANSON, 33, Clement's-lane, Lombard-street, City.

## Baron Liebig on Allsopp's Pale Ale.

"I am myself an admirer of this beverage and my own experience enables me to recommend it, in accordance with the opinion of the most eminent English physicians, as a very agreeable and efficient tonic, and as a general beverage, both for the invalid and the robust." — *Gleeson*, May 6.

ALLSOPP'S PALE ALE ONLY is BOTTLED by PARKER & TWINING, Beer Merchants, 51, PALL-MALL.

IMPERIAL MEASURE. — Quarts, 8s.; Pints, 5s.; Half-pints, (for luncheon,) 3s. per dozen. Also in Casks of 18 gallons and upwards.

## Allsopp's Pale Ale. — Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1862, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BREWERY PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

## Rice Harris and Son, Islington

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON. — PATENT SANITARY GAS SHADES. — These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroys the effluvia and smoke, which have hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham, and at Mr. JOHN SHORTER'S, Crispin-street, Spitalfields, London.

## Gold Chains and Jewellery. —

WATHERSTON and BROGDEN beg to caution the Public against the ELECTRO GOLD CHAINS and POLISHED ZINC GOLD so extensively put forth in the present day under the titles of "Pure Gold" and "Fine Gold," and to call attention to the genuine Gold Chains made from their own ingots, and sold by troy weight at its bullion or realizable value, with the workmanship at wholesale manufacturer's prices. The gold guaranteed, and repurchased at the price charged — the workmanship, according to the simplicity or intricacy of the pattern. An extensive assortment of Jewellery of the first quality, all made at their manufactory, 16, Henrietta-street, Covent-garden, London, established A.D. 1793.

## Matrimonial Institution. — Founded

1846. — Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York. — This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTBURY, 12, John-street, Adelphi, London.

## Apothecaries' Hall — College of Sur-

geons. — Dr. STEGGALL continues to assist gentlemen in their studies, preparatory to Examination at the Royal College of Physicians, College of Surgeons, Apothecaries' Hall, St. Andrew's, Aberdeen, &c., either in class or separately. — For terms, apply before One, and after Three o'clock, daily, at 2, Southampton-street, Bloomsbury-square.

## Sydenham College Medical School,

ST. PAUL'S SQUARE, BIRMINGHAM. — The SESSION 1864-65 will Commence on Tuesday, October 3rd, with an Introductory Address by Dr. ELKINGTON.

Anatomy and Physiology — John White Keyworth, M.B.

Pathology — James Russell, M.D.

Practical Anatomy and Demonstrations — Messrs. George Elkington, Frowd Jones, and John Postgate.

Principles and Practice of Medicine — Bell Fletcher, M.D., F.R.C.P.L., Physician to the General Hospital.

Principles and Practice of Surgery — Mr. Alfred Baker, F.R.C.S., Surgeon to the General Hospital.

Chemistry — Mr. Alfred Hill.

### SUMMER SESSION.

Therapeutics — Dr. Russell, formerly Senior Physician to the Birmingham General Dispensary.

Materia Medica and Pharmacy — Mr. Bassett.

Midwifery and the Diseases of Women and Children — Dr. Elkington, Consulting-Accoucheur to the Lying-in-Hospital, and Mr. V. W. Blake, Medical Officer to the Lying-in-Hospital.

Practical Chemistry — Mr. Alfred Hill.

Botany — Mr. Westcott, Assoc. L.S.

Forensic Medicine — Mr. Orford, Medical Officer to the Lying-in-Hospital; the Toxicological part of this course by Mr. Hill.

The College is situated within a short distance of the General Hospital, and the hours of Lecture are so arranged as not to interfere with the attendance upon Hospital Practice.

Clinical Courses will be given by those Lecturers who are attached to the various public institutions in the town.

The Introductory Lecture will be delivered on October 3rd, at three P.M., in the theatre of the College; after which, the annual distribution of Prizes will take place.

Further particulars may be obtained on application to the Principal, Dr. FLETCHER, or to Mr. ALFRED HILL, Hon. Sec.

St. Paul's-square, Birmingham, Aug. 1864.

## School of Anatomy and Medicine,

adjoining St. George's Hospital.—The WINTER SESSION will commence on Monday, October 2, 1864.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by Mr. Lane.  
Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.  
Chemistry—Mr. J. E. D. Rodgers.  
Medicine—Dr. Cormack and Dr. Ballard.  
Surgery—Mr. Pilcher and Mr. Spencer Wells.  
Midwifery—Mr. Bloxam.  
Materia Medica—Dr. Ballard.  
Forensic Medicine—Dr. B. W. Richardson.  
Botany—Dr. Lankester.  
Practical Chemistry—Mr. J. E. D. Rodgers.  
Comparative Anatomy and Zoology—Mr. R. T. Hulse.

For further particulars and prospectuses, apply to Dr. Lankester, 22, Old Burlington-street; Mr. R. W. Burford, at the School, 1, Grosvenor-place; or at the residences of the respective Lecturers.

## King's College, London.—Medical DEPARTMENT.—The WINTER SESSION, 1864-5, will commence on Monday, October 2, 1864.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1864.

R. W. JELF, D.D., Principal.

## St. Mary's Hospital and Medical SCHOOL.—The WINTER SESSION will commence on Monday, the 2nd of October, with an Introductory Address by Dr. ALDERSON, F.R.S., at Half-past Two o'clock.

### LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.  
Pathological Anatomy—Dr. Markham.  
Chemistry—Dr. Albert J. Bernays.  
Medicine—Dr. Chalmers and Dr. Sibson.  
Surgery—Mr. Coulson and Mr. Spencer Smith.  
Clinical Medicine—Dr. Alderson.  
Clinical Surgery—Mr. Ure.

### SUMMER SESSION, 1865, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.  
Materia Medica—Dr. Sieveking.  
Practical Chemistry—Dr. Albert J. Bernays.  
Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.  
Medical Jurisprudence—Mr. Ancell.  
Military Surgery—Dr. James Bird, F.R.C.S.E.  
Ophthalmic Surgery—Mr. White Cooper.  
Aural Surgery—Mr. Toynbee.  
Dental Surgery—Mr. Nasmyth.  
Comparative Anatomy—  
Natural Philosophy—

HOSPITAL PRACTICE.—The hospital contains upwards of 150 beds, 65 of which are devoted to Medical, and the rest to Surgical, cases. This division includes a ward appropriated to the Diseases of Women, and also beds for Ophthalmic and Aural cases. A Maternity Department is attached to the hospital: 218 poor married women were delivered at their own homes during the past year. The In-patients are visited daily by the Physicians and Surgeons. At one o'clock, Lectures on Clinical Medicine will be regularly delivered by Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the other Medical Officers in their respective departments. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and are appointed for eighteen months; two non-resident Medical Officers. A Medical and a Surgical Registrar, Clinical Clerks, and Dressers, will be selected from the best-qualified Students. All the above offices are open to competition amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of gentlemen in practice in the vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 8th, 1864.

H. SPENCER SMITH,  
Dean of the School.

### TO THE PROFESSION.

Mr. Bowmer, M.R.C.S. Eng., 50, LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## A Surgeon practising in a county

A town requires an ASSISTANT, to Dispense and attend Midwifery. A practical knowledge of Midwifery essential.—For particulars, apply, by letter, addressed H. O., Lincoln's-inn-fields, London.

### TO MEDICAL PRACTITIONERS.

## The Parents of a Youth, aged seven-

teen, wish to Apprentice him to a Medical Man (a Licentiate of the Apothecaries' Company) in London, or a provincial town possessing a Medical School, with whom he would have good opportunities of visiting, when qualified. He has already attended some Lectures at a Medical School, and can read Prescriptions, &c. Having been engaged for several years with Accounts, he could keep the Books very well. He passed the recent Matriculation Examination of the University of London in the First Division. The Medical Profession being his own exclusive choice, he would assist his master to the utmost of his power. If a premium be required, his parents are only able to give a very moderate one. Excellent references can be given, and an interview if required. Address, W. M., Post-office, Wakefield.

## Royal Institution of Great Britain,

ALFENMARIE-STREET.—The next ACTONIAN PRIZE of £206 will be awarded, in the year 1865, to an Essay illustrative of the Wisdom and Benevolence of the Almighty as manifested by the Influence of Solar Radiation. Competitors for this Prize are requested to send their Essays to the Royal Institution on or before Ten o'clock p.m., December 31st, 1867, addressed to the Secretary; and the Adjudication will be made by the Managers on Monday, April 12, 1868.

JOHN BARLOW, M.A., Sec. R.I.

## Resident Clinical Assistant.—A

Vacancy having occurred in the HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, those gentlemen who are desirous of becoming candidates for the office of Clinical Assistant are requested to send in their applications, with testimonials, on or before the 4th of September next, and to attend the Medical Committee on Tuesday, the 5th of September, at Four o'clock. Testimonials as to moral character, as well as to medical qualifications, are required.—Further particulars may be obtained at the Hospital, Brompton.  
PHILIP ROSE, Hon. Sec.  
Aug. 10, 1864.

## Torbay Infirmary and Dispensary,

TORQUAY, DEVON.—HOUSE SURGEON.—The Governors will proceed to the Election of a House Surgeon (to act also as Secretary) to the above Institution, on Thursday, the 24th day of August next. Candidates must send in their testimonials, under cover, to the House-surgeon, on or before Tuesday, the 15th day of August. Candidates must have a diploma from one of the recognised Universities of the United Kingdom, or from one of the Royal Colleges of Surgeons, and must be Licentiates of the Apothecaries' Company. They must be single, and not less than twenty-four years of age. No private practice allowed. The salary is £50 per annum, together with board, lodging, coals, candles, and attendance; or £30 per annum in lieu of board.  
Torquay, July 24th, 1864.

## Manchester Royal Infirmary,

DISPENSARY, LUNATIC HOSPITAL, or ASYLUM.—Wanted, in consequence of the resignation of Mr. F. A. Heath, who has completed the period of his engagement, an unmarried Gentleman, as HOUSE SURGEON to these Charities. Every candidate for the office will be required to produce a Diploma from the Royal College of Surgeons in London, Edinburgh, or Dublin, and a License from the Worshipful Society of Apothecaries in London. The duties of the house surgeon are, to assist the surgeons at operations, and in dressing the patients; to visit the patients in the absence of the surgeons, under whose control he is to consider himself; and to take charge of the accidents in the absence of the surgeon of the week. He must take an engagement for one year. No salary is given; but the whole medical and surgical practice of the house will be open to him; and he will be provided with board and lodging in the Infirmary.—Letters from candidates, together with the diplomas and testimonials, are to be sent, free of postage, on or before Saturday, the 26th August next, addressed to the Secretary.

By order of the Board,

Weekly Board, July 31st, 1864.

R. THORPE RADFORD, Secretary.

## Derbyshire General Infirmary.—

OFFICE OF PHYSICIAN.—A Vacancy being occasioned by the Resignation of Dr. Bent, the Senior Physician of this Institution, gentlemen properly qualified, wishing to procure the appointment, are requested to send in their applications and testimonials as to their professional qualifications to the Secretary, not later than Twelve o'clock, on Monday, the 21st August next.

No gentleman is eligible who is not a Graduate in Medicine of Oxford or Cambridge; Doctor of Medicine of the University of London, Dublin, Edinburgh, Glasgow, or Aberdeen; or Licentiate or Extra-Licentiate of the Royal College of Physicians in London; or who practices any of the following branches of the Profession—viz., Surgery, Pharmacy, or Midwifery; or who is connected in partnership with any gentleman in such practice.

The Election will take place at a Special General Meeting, to be held on Monday, the 29th August next.

Derby, 24th July, 1864.

By order,

SAMUEL WHITAKER,  
Secretary.

# Messrs. Lane and Lara,

MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1928.)

It may be reached in three hours from London. The nett income is £800 per annum, and is capable of great and immediate increase. Purchase-money for everything, as it is, between £2000 and £3000.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## The General Hospital, Birmingham.

There is a Vacancy in this Hospital for a RESIDENT PUPIL. — Terms and all other particulars may be obtained of the Secretary at the Hospital.  
July 28th, 1864. ROBERT J. NEWMAN, Secretary.

### MEDICAL.

**There are Vacancies at the West-**  
MINSTER HOSPITAL for a HOUSE-PUPIL and an Out-door APPRENTICE, who would have unusual advantages afforded them of obtaining a thoroughly practical knowledge of their profession. — For terms and particulars apply to Mr. Newcomb, the Resident Medical Officer.

**A gentleman connected with the**  
Medical profession will be happy to Collect their Accounts on Commission, and will make advances of money upon the amounts, Bills of Exchange, or any other collateral security. References, if required. — Apply, by letter, prepaid, to W. C., Post-office, Clifton-street, Finsbury-square.

### TO SURGEONS.

**To be Let, a House, with Surgery,**  
in a most excellent situation, to any gentleman desirous of establishing an extensive connexion in the above profession. — Apply to Mr. D. Catling, 27, Halliford-street, Lower-road, Islington, from One to Two, or after Six in the evening.

## Medical Practice, receipts from £300

to £400 per annum, to be Disposed of, for £100 down, to include a well-stocked and fitted-up Surgery; two months' Introduction. — Address, Beta, THE LANCET Office, Strand, London.

### MEDICAL.

**Wanted, by a gentleman aged 30,**  
who has completed his hospital studies, a Situation with a General Practitioner in town or country. Satisfactory reference can be given, both as regards respectability, moral character, and ability. — Address, A. B., 24, Præd-street, Paddington.

## A Gentleman wishes to place his

Son to reside for Two Years (previous to his walking the hospitals) with a General Practitioner in the country, having either Hospital or large Union Practice. — Terms to be addressed to Delta, Post-office, Sherborne, Dorset.

### MEDICAL.

## Wanted, by an M.R.C.S. Eng., L.A.S.,

and London Licentiate in Midwifery, aged twenty-eight, a situation as Visiting ASSISTANT, either in town or country; he is fully conversant with Private as well as Club and Union Practice, and can give most ample references as to respectability, &c. He would not object to take the charge of a Branch Practice. — Address, post-paid, to Mr. Hale, Fenny-Stratford, Bucks.

## Wanted, by a Surgeon in Leeds, an

ASSISTANT to Dispense and Visit. He must be a neat dispenser, capable of attending to minor cases, and able to attend occasional cases of Midwifery. If Lectures have not been attended, and it is wished to attend them, it can be done. The situation might be a permanent and increasingly valuable one for a gentleman whose character and conduct are satisfactory. — Apply, stating age, terms, &c., to F. R. C. S., 23, Park-place, Leeds.

### Medical Transfer and Partnership.

30, Bucklersbury, London.

## Mr. Orridge, Medical Transfer Agent

and Referee, in offering his services as a Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

## General Practice. — £500 per annum.

A highly respectable Connexion, of long standing, in a beautiful district in a western county, is Transferable. The gentleman succeeding should be fully qualified, and not under thirty years of age. There is an excellent family residence, garden, &c. An efficient Introduction can be given. No appointments. — Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

## Medical Retail. — The death of a

practitioner near Waterloo-place vacates a PRACTICE (with Retail establishment attached) in a very commanding position at the West-end of town, near the clubs, with a very desirable Connexion, which may be largely extended, and to which an Introduction can be given. The residence is a corner one, with valuable Lease. Entrance, £600. — Apply to Mr. ORRIDGE, 30, Bucklersbury.

### MEDICAL.

## An Open Surgery, well situate near

Brunswick-square, offering an Opening for a Practitioner, at little outlay, is Transferable upon easy terms. — Apply to Mr. ORRIDGE, 30, Bucklersbury.

## Wanted, by a Surgeon in the

country, a duly-qualified ASSISTANT, to Visit and Dispense. To reside in the house. A liberal salary given. — Apply, by letter, stating age, &c. to M. O., 27, Craven-street, Strand, London.

## A Gentleman, aged 22, accustomed

to a mining and manufacturing district, wishes for a Situation as ASSISTANT. Unexceptionable references given. — Address, J. E. O., Surgery, King-street, Wigan, Lancashire.

## Medical Pupil. — A General Prac-

titioner, holding the three qualifications, requires a PUPIL, he would have the advantage of obtaining a practical knowledge of his profession, and also a comfortable home. Premium moderate. — Address, A. G., 7, Slade's-place Deptford.

### TO DENTISTS.

## To be Sold, a Practice, in one of the

largest towns of England, averaging about £1000 per annum for the past ten years. — For terms, &c., apply, by letter, to Z., Mr. Geo. Davies, 4, Pancras-lane, City.

### TO SURGEONS.

## Wanted, a Situation as Visiting, or

Visiting and Dispensing ASSISTANT, by a young gentleman, aged twenty-five. Understands Parish and Club Practice. — Address, Medicus, 6, Castle-street, Oxford-street.

## Wanted, by a Surgeon in the

country, a duly-qualified ASSISTANT to Visit and Dispense. It is requisite that he should have a thorough practical knowledge of his profession. One having a knowledge of the Welsh language would be preferred. — Address, stating age, reference, and salary required, to D. Davies, Esq., Bryngolwg, Aberdare.

## Insanity. — A married Physician,

(formerly Medical Superintendent of an Asylum,) residing in one of our most esteemed inland watering-places, would be happy to receive a Gentleman suffering from a mild form of mental disease. The comforts and accommodation offered are of a very superior character, and for which adequate compensation would be expected. — Address, W. H. N., care of Mr. Bingham, Broad-street, Bristol.

TO STUDENTS ABOUT TO ATTEND ST. GEORGE'S OR ST. MARY'S HOSPITALS.

## A Married Surgeon, without family,

living close to Hyde-park, can receive TWO PUPILS to board and assist in their studies. Each can have a private apartment, with other convenience for Chemical, Pharmaceutical, or Anatomical experiments. The advertiser can receive one as an articled pupil, whose education he will entirely direct. — Address to M. B., Marshall's Library, 21, Edgeware-road.

## General Medical Practice for Transfer,

in a good market-town, surrounded by many adjacent villages, and a rich, well-populated district. A Churchman, well qualified, might calculate, with tolerable certainty, upon a considerable increase of business. The receipts average £250 per annum, including clubs. There is a good, convenient house, garden, and offices; and, should a suitable person offer, the terms would be found easy and moderate. — Apply to Dr. Smyth, Bingham, Notes.

## Oleum Jecoris Aselli.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**Messrs. ANSAR, HARFORD, & Co.,** have the honour of informing the Medical Profession and the Public generally, that they have opened an Establishment at No. 77, STRAND, for the exclusive Sale of DR. DE JONGH'S COD-LIVER OIL, for which they have been appointed Sole Agents and Consignees in the United Kingdom and the British Possessions.

Whilst the marvellous effects of the Cod-liver Oil, and its superiority over every other remedy for the cure of Consumption, Asthma, Gout, Chronic Rheumatism, and all kinds of Scrofulous Complaints, are now too generally admitted by the most eminent practitioners to require any detailed exposition, a brief statement of the claims to public support of the peculiar preparation now first introduced into this country will naturally be looked for.

DR. DE JONGH, a Dutch physician of eminence, has, as it were, exclusively devoted himself, for upwards of fourteen years, to a series of scientific researches into the nature and properties of this inestimable medicine. His works, recording the results of his investigations, have been translated into most of the European languages; by universal admission, they are regarded by the Faculty as the standard authority upon the subject, and in addition to having obtained the spontaneous approval and the most flattering testimonials from some of the most eminent medical men and scientific chemists in Europe, including the names of BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, and FOUQUIER, they have been rewarded by his Majesty Leopold I, the King of the Belgians, with the large Gold Medal of Merit, and by his Majesty William II, the King of the Netherlands, with a Silver Medal, specially struck for the purpose.

DR. DE JONGH'S elaborate researches and practical observations have demonstrated the superior efficacy of the Light-brown Oil, which effects a cure in a much shorter time than the pale oil. His series of therapeutical experiments with the various kinds of Cod-liver Oil have invariably proved the light-brown to contain iodine, phosphate of chalk, volatile acid, and the elements of the bile,—imparting the colour to the Oil, and deemed amongst its most active and essential principles,—in larger quantities than the pale oil manufactured in England and Newfoundland, which by its mode of preparation is in a great measure deprived of these active principles.

So strikingly beneficial have been the results attending the use of the preparation to which DR. DE JONGH has awarded the preference, that in Holland and Germany, where this remedy has been prescribed for upwards of thirty years by the Faculty, for Rheumatism, Gout, and Scrofulous Diseases, and of late years with signal success for Consumption, the pale, or rather the yellow oil, in favour of which, owing to its long use and to its being considered in a very trifling degree more palatable, there existed a deep-rooted prejudice, is at present almost totally disused. In France and Italy, where its introduction is of more recent date, DR. DE JONGH'S Oil is already held in the highest repute amongst the most distinguished practitioners, and is in most extensive demand on the part of the public.

From every cask of Cod-liver Oil prepared according to DR. DE JONGH'S directions, a sample is taken, and submitted by him to the most careful chemical analysis prior to its being exposed for sale. By this means, the Faculty and the Public in general may rest assured of being able to procure the purest and most efficacious Cod-liver Oil; and this medicine, no longer exposed to the influence of accidental causes or foreign ingredients, capable of destroying, altering, or paralyzing its effects, will be able to assert its full rights, and maintain the ground it has so deservedly acquired.

A pamphlet, by DR. DE JONGH, with detailed remarks upon the superiority of the light-brown oil, directions for its use, cases in which it has been prescribed with the greatest effect, and testimonials, will be forwarded to medical practitioners gratis on application. The bottles containing the oil are labelled, and bear DR. DE JONGH'S stamp and signature, to which particular attention is requested. Directions for use accompany every bottle.

*The following are selected from some of the leading Medical and Scientific Testimonials in favour of  
DR. DE JONGH'S COD-LIVER OIL:—*

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

(Signed)

"**DR. JUSTUS LIEBIG.**

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

**DR. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the author of the best analysis and investigations into the properties of this Oil should himself be the purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to

your application. The Oil which you gave me was of the very finest quality; whether considered with reference to its colour, flavour, or chemical properties and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

"**JONATHAN PEREIRA.**

"Finsbury-square, London, April 18, 1851.

"To Dr. de Jongh."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"DEAR SIR AND HONOURED COLLEAGUE,—I must begin by thanking you for your polite attention in sending me your works, and must furthermore openly acknowledge that you have rendered an eminent service to science, by acquainting practitioners with the cause of the frequent irregularity in the effects of the Cod-liver Oil, and directing their attention to a proper choice. You have thereby preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases. It is therefore with the greatest pleasure that I pay my tribute of well-merited praise to the successful efforts of the learned physician and chemist, whose researches after truth have cost him so many sacrifices, and who has shown us the way of rendering highly effectual the administration of one of the most powerful medicines we are acquainted with.

"Accept the assurance, most honoured colleague, of my sincere expression of gratitude and regard.

(Signed)

"**FOUQUIER.**

"Paris, Nov. 12, 1847.

"To Dr. de Jongh at the Hague."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions; and by all respectable Chemists and vendors of Medicine in Town and Country, at the following prices:—

 Braes; Yellow-Haired Laddie, and Whistle, and I'll come to Thee; Jock o'  
 Hazledean; Highland Mary, and London's Bonnie Woods; The Keel Row;  
 Logie o' Buchan; The Blue Bell of Scotland; Annie Laurie; Comin' through  
 the Rye; Auld Lang Syne, and Highland Laddie; Wandering Willie, and My  
 Love she's but a Lassie yet; Scot's wha hae wi' Wallace, &c.

"This writer's arrangements are much sought after, on account of their  
 facility, united with incomparable elegance."

London: Robert Cooks and Co., New Burlington-street, Music Publishers to  
 the Queen; and all Music-sellers.

**"The Times."—The "Evening Mail,"**  
 being half the price of "The Times," is published in London three  
 times a week, on the afternoons of Monday, Wednesday, and Friday, in time  
 for the country post. The "Evening Mail" contains all the matter of "The  
 Times" (except the Advertisements), and includes the Second Edition of  
 "The Times," and the Corn and Cattle Markets, &c., on the day of Pub-  
 lication. Subscription 32s. 6d. per half year in advance. This paper, and  
 all the London newspapers, supplied by W. DAWSON and SONS, Abchurch-  
 yard, and 74, Cannon-street, City, London. Established 1809.

**Allen's Illustrated Catalogue, con-**  
 taining size, price, and description of upwards of 100 articles, consisting  
 of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes,  
 Writing-desks, Dressing-cases, and other travelling requisites, forwarded on  
 receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the  
 bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and  
 their New Quadruple Portmanteau (containing four compartments), are the  
 best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture,  
 and Military Outfitters, (see separate Catalogue),  
 18 & 23, WEST STRAND.

**Recherche Wines!—First growth**  
 Wines only! At the following very reduced prices on cash terms  
 only:—

Sherry—"Amontillado and Montilla character." In Dock, at £53 per Butt,  
 £26 per Hhd.; £23 per Quarter Cask. Duty paid—£21 per Quarter Cask, £22  
 per Hhd., £24 per Butt, 42s. per dozen.

Port—Very rare old Wines, 49s. and 54s. per dozen. Connoisseurs, who  
 cannot suit their taste, except on rare occasions, are invited to try these  
 Wines. Vintage Ports for laying down.

The qualities of Wines most prized being different, some preferring pale,  
 others brown, some dry, some fruitiness and smoothness, all of which are  
 consistent with purity, gentlemen are solicited to call and taste the Wines at  
 Mr. HAMMICK'S Office, No. 11, Pall-mall, London.

First class! Champagne, Moselle, Hocks, Claret, Sauterne, &c., at the  
 most moderate prices.

These Wines are patronised and recommended by several eminent Physicians,  
 and are especially recommended to Connoisseurs. Samples, with List of Prices,  
 forwarded on application.

There being no credit on freights, neither on duties, and to buy in the best  
 market, cash terms command every advantage, and are essentially requisite to  
 obtain the best and purest Wines at the lowest possible prices.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the  
 "Travellers' Club."

**The Pulvis Jacobi Verus, prepared**  
 by WILLIAM HOOPER, 21, Russell-street, Covent-garden, from its  
 identity with the more costly preparations, and its acknowledged efficacy as  
 an Antimonial, merits the patronage of those gentlemen who have not hitherto  
 included Pulvis Jacobi in their daily Materia Medica. An extensive con-  
 tinuous demand for Public Institutions has satisfactorily verified the ancient  
 character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 9d. and  
 10s. 6d.; and in packets for transmission by post.

**Elastic Supporting Belts, of the same**  
 beautiful fabric as Pope and Plante's Elastic Stockings for Varicose  
 Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY  
 ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a  
 point little attended to in the comparatively clumsy contrivances and fabrics  
 hitherto employed.

Instructions for measurement and prices on application, and the articles sent  
 by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place,  
 Pall Mall, London.

**Railway Travellers, and all persons**  
 suffering from weakness, should obtain one of W. S. SPARKS'S newly-  
 invented URINALS, for night and day use, for both male and female. They  
 are made on the most approved principles, so as to prevent any unpleasant-  
 ness, are very durable, and at prices within the reach of all. W. S. also  
 manufactures all articles in India-rubber and gutta-percha for invalids,  
 including bed-pans, sheeting, water and air cushions, pillows and mattresses,  
 bearing-tubes, portable bath elastic bandages, stockings, knee-caps, &c. &c.  
 Water-beds on sale or hire. The medical profession, hospitals, and country  
 dealers supplied on the best terms, and circulars, &c. forwarded on applica-  
 tion.—W. S. SPARKS, India-rubber Manufacturer, 115, New Bond-street.

**A New Discovery.—Mr. Howard,**  
 Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW  
 DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires,  
 or ligatures. They so perfectly resemble the natural teeth as not to be  
 distinguished from the original by the closest observer; they will NEVER  
 CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever  
 before used. This method does not require the extraction of roots, or any  
 painful operation, and will give support and preserve teeth that are loose, and  
 is guaranteed to restore articulation and mastication; and that Mr. Howard's  
 improvements may be within the reach of the most economical, he has fixed  
 his charges at the lowest scale possible. Decayed teeth rendered sound and  
 useful in mastication.

52, Fleet-street. At home from Ten till Five.

**Teeth.—Mr. Alfred Jones, of Gros-**  
 venor-street, has recently completed a new and important improvement  
 in the construction of ARTIFICIAL TEETH. The superiority of their  
 appearance, and the unerring accuracy with which they are fitted to the  
 mouth, without wires, springs, or ligatures, and the lightness of their con-  
 struction, gives greater facility in mastication and freedom to the speech, and  
 imparts a more youthful appearance to the countenance than has hitherto  
 been attained; they support any teeth that may be loose, and have been tested  
 by many of the first medical men, the nobility, and gentry, from whom he has  
 received the most flattering acknowledgments of success. Supplied only by  
 Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of  
 Gloucester, her late Royal Highness the Princess Augusta, and his late  
 Majesty Louis Philippe, the ex-King of the French, &c.—54, Grosvenor-street,  
 Grosvenor-square.—At home from Eleven until Five.

**Scientific Professional Apparatus,**  
 manufactured and sold by HORNE, THORNTWHAITE, and WOOD,  
 121 and 123, Newgate-street, London, who invite attention to the following  
 articles, which have given universal satisfaction:—

MEDICAL ACHROMATIC MICROSCOPES, in Case, for Anatomical  
 Urinary Deposits, &c., £3 10s., £5 5s., and upwards.

ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism  
 of great quantity, and of the only form and construction suitable for Medical  
 Application, in portable Case, £3 3s., £5 5s., and £8 8s.

URINOMETERS, gilt metal, 14s.; glass, 4s. 6d. In Case, for pocket, with  
 Thermometer, Acid, &c., 31s. and 36s.

APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY.  
 In Cases, £2 3s., £5 5s., and £10 10s.

\* Any required information and price-lists forwarded on application.

**Microscope for Sale.**—A Second-hand Instrument, very nearly new, by Ross; price, £19; cost £27.  
A. ROSS, 2, Featherstone-buildings, High Holborn.

**Mr. T. H. Wakley's Stricture Instruments.** Complete Sets of these Instruments may now be had of  
WEISS & SON, 62, Strand, London.

**PATENT SELF-ADJUSTING TRUSSES.**  
**Salmon, Ody, and Co.,** most respectfully inform the Public, that their Patent Self-adjusting Trusses afford more ease and security for the relief of HERNIA than any other instrument for the purpose. They will answer for right or left side, requiring no under-strap or any galling bandage. Persons in the country are requested to send the circumference of the body one inch below the hips.

**CAUTION.**—As many mercenary druggists are vending an inferior article, purchasers are requested to observe that SALMON, ODY, and CO., 292, Strand, London, is marked upon the leather case.  
Sold by one or more druggists in every city and principal town in the United Kingdom.

**Mr. Bourjeaurd's Registered Elastic**  
APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five,

Fig. 1.

Fig. 2.

FIG. 1.—MR. BOURJEAURD'S NEW SUSPENSORY BANDAGE, as applied to a patient.—Mr. Bourjeaurd begs to state that the bag supporting the scrotum is made of a delicate webbing of silk and india-rubber; the bands running round the thighs consist of the most yielding elastic tissue, and will stretch to twice their length; a third band is adapted to the upper part of the bag, the former being intended to be fastened to the flannel waistcoat of the patient. The scrotum is thus kept raised and fixed *in situ*, without distressing the organ in the least, the suspensor allowing of the most varied movements of the body.

FIG. 2.—The same Suspensory Bandage taken off.

## Briet's Double Patent

PORTABLE GAZOGENES, or SODA-WATER APPARATUS, for the immediate production of Soda Water, Lemonade, Sparkling Wine, &c. &c.—The delightful Beverages made with the Gazogene render it an almost necessary requisite for the dinner-table, while its extensive introduction into most of the French and many of the English hospitals is a guarantee of its value in the sick chamber.

To secure the economical use of the Machine, the Patentees have introduced special Powders, more effective, and at the same time lower in price, than can be had from any other source; in proof of which, and also of the innocuous nature of the materials used, the subjoined testimonial from the celebrated chemist, Dr. Andrew Ure, will doubtless be deemed satisfactory:—

"London, July 25th, 1854.

"I have examined very carefully the construction and performance of Briet's Double Patent Portable Gazogene Apparatus, and find it admirably adapted for collecting and condensing in water carbonic acid gas, imparting to it great strength and pungency.

"Tartaric acid and bicarbonate of soda, or the special powders prepared for the machine, may be used in the specified quantity to produce the gas; having tried both, I give it as my decided opinion, that while tartaric acid gives a good result, the prepared powders are more effective in producing a stronger and equally pure beverage.

"This Machine is also well adapted for impregnating with gas saccharine or other solutions, such as the healthful and cooling drinks made from fruit essences; it may also be employed so as to imitate sparkling wines.

"The internal tube and other fittings being made of pure Cornwall tin, and consequently not acted upon in the slightest degree by carbonic acid gas contained in the water to be drank, render it more durable for family use than in cases where more brittle materials are employed.

"The Machine being self-acting is very easily managed.

"ANDREW URE, M.D., F.R.S.

"Messrs. Gebhardt, Rettman, and Co.,  
21, Bartlett's-buildings, London."

Messrs. Mendillot, of Paris, successors of Briet, and Proprietors of the said Letters Patent, beg to inform the Trade that Messrs. Gebhardt, Rettman, and Co., are their sole appointed Agents for the sale of the above-mentioned articles, which are only to be obtained genuine from them, at their Warehouse, 21, Bartlett's-buildings, Holborn, London.

Briet's Patent Gazogenes are sold retail by most of the respectable Chemists and Druggists in the United Kingdom.

Merchants and Shippers will find this article well adapted for the Colonies.

**Cocoa-nut Fibre Matting and Mats,**  
of the best quality.—The Jury of Class 26, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

**The 16s. Trousers reduced to 14s.**—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**Notice.**—Before leaving town, Ladies

and Gentlemen should provide themselves with one of Berdoe's well-known VENTILATING WATERPROOF GARMENTS, which resist any amount of rain, without confining perspiration, (the fatal objection to all other waterproofs,) while their respectability adapts them for general use, equally as for rainy weather. An extensive variety for selection.

W. BERDOE, Tailor, 98, New Bond-street, and 69, Cornhill, (only.)

**To all who cannot get a Fit; the**

importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance. R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

**Novelty in Bedsteads, adapted for**

the Nursery, Sick Chamber, Sitting-room, and Drawing-room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattresses complete, 35s.—the most complete article ever introduced to the public.—

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

**Gas-heating Apparatus.—H. Mather**

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 78, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

**Rice Harris and Son, Islington**

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADERS.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**Mr. Mechi having had the honour of**

supplying the Crystal Palace Company with Table Knives of a novel and pleasing form, begs to state, that in future he will name them the CRYSTAL PALACE TABLE KNIVES, and supply them to the public, of a similar quality, in fine ivory, 80s. per dozen; transparent ivory, 42s. per dozen. Mr. Mechi charges the same prices for his manufactures, when disposed of at the Crystal Palace, as he does at his establishment in Leadenhall-street. Owners of merchant-steamers, hotel-keepers, and all public establishments, will find these knives far more economical and durable than the usual sort, being on an entirely new construction, and not affected by immersion in hot water.—4, Leadenhall-street.

**Gold Chains and Jewellery.—**

WATHERSTON and BROGDEN'S GOLD CHAINS, by troy weight, at realizable value, and the workmanship at wholesale manufacturers' prices.

EXAMPLE.

Intrinsic value of a chain of 15 carat gold, weighing 1½ oz. ... £8 19 7  
Supposing the workmanship to be ... .. 3 0 0

Total ... .. £ 12 19 7

By this arrangement the public will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery, of the first quality, all made at their manufactory 18, Henrietta-street, Covent-garden, London.

Established A.D. 1798.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES.—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.  
CAPITAL, £100,000.

TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	£ 95,500	£ 3,439 0 1
1852	677	278,855	10,608 12 2
1853	1025	413,785	15,836 3 6

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DUTY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## Metcalf and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

## Darby and Gosden beg to call

the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.

140, LEADENHALL-STREET, CITY.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEVY, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC. Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.  
FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Hold, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in Imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.  
Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Purification of Linen—Prevention of

DISEASE.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marybone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one basket per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boileve, Esq.

Firm of JOHN WOOLLAWS and Co., Paper-stainers.

## Warming and Ventilating by Hot

AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

4, Leadenhall-street, London, May 6, 1854.

DEAR SIR,—I have great pleasure in testifying to the value of your Calorifere, or Heating Apparatus, on the score of economy and utility; it combines warmth and purity of atmosphere, and is a vast improvement on our present absurd system of putting a current of cold air over our bodies, to be warmed in our fire-places, and then to be wasted up our chimneys.

No doubt your Calorifere will soon be used for our conservatories and green-houses, and most likely for warming our cattle, and drying our corn: I find no difficulty in warming our upper rooms by your Calorifere.

I am, dear Sir, your obedient servant,

To J. Boileve, Esq.,

55, King William-street, City, London.

J. MCHIE.

## Shower and all Domestic Baths.—

Purchasers of these valuable and important family requisites should immediately inspect DEANE, DRAY, and CO.'S extensive Stock, warranted the best manufactured, both for finish and durability. Deane, Dray, and Co.'s RECURRENT SHOWER BATH forms at the same time an excellent Sponging Bath, and may also be used as a Hip Bath, thus affording to all the members of a family the various applications of the bath. Shower-baths of improved construction; Hip, Plunging, Sponging, Vapour, and other Baths of various sizes and patterns. An illustrated pamphlet on Baths and Bathing may be had on application, or free by post. Established A.D. 1700.

DEANE, DRAY, and CO., (opening to the Monument,) London-bridge.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MARINA SALT FOR BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 1s. per packet, by the Proprietor, C. JENSEN, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

# AN ACCOUNT OF THE METROPOLITAN BILLS OF MORTALITY.

FROM THEIR COMMENCEMENT TO THE PRESENT TIME.\*

By G. F. COLLIER, M.D.

HAVING had the honour to be temporarily employed by Mr. Panizzi, under the trustees of the British Museum, in collecting, digesting, and cataloguing the national records of mortality, expressly with the view to determine and to supply certain deficiencies in the old London Bills of Health, and having completed the annual bills of the eighteenth, as well as those of the nineteenth century, up to the last published annual bill, public utility, at the present juncture, seems to challenge a brief report of such investigation, in order to call the attention of the state and of the nation to the importance of possessing these documents in duplicate, agreeably with the avowed object for which the charter of the parish clerks was granted by the sovereign.

It is scarcely necessary to observe that, up to the time of Henry the Eighth, no general register of births or deaths was kept in England. It was in 1538 that registry became universal, as one consequence of the seventeen decrees set forth in that year, in the name of the king, by the Lord Thomas Cromwell, his vice-regent in ecclesiastical affairs; which injunctions appointed that the parson, vicar, or curate of every parish should keep a true and exact register of all weddings, christenings, and burials. This laudable example set by our ancestors to all Europe was speedily imitated by France, for in the year following, Francis the First issued an *ordonnance*, rendering the same measure compulsory on all the vicars of his dominions. The year 1592 is assigned, by all the authorities consulted on the subject of City registry, as the earliest period of the City bill, and 1611 as the date of the first incorporation of the parish clerks—that is to say, in the ninth year of James the First. These are the grave and oft-repeated errors of the books, due to the circumstance that authors who have handled this matter have all been content with the information supplied by John Bell, chief clerk of the Parish Clerk's Hall in 1665, without tracing the historic records of earlier periods. The lay clerks were, indeed, then incorporated, but the City parish clerks had been in existence as early as A.D. 1233, on Jan. 19th of which year they were incorporated, by Henry the Third, by the style and title of "The Fraternal of Parish Clerks," they being by that charter all required to be of the lower orders of deacons ecclesiastic, and competent to act in part-performance of the mass. It is equally erroneous that the bills took their rise in 1592. Proofs are extant that various sovereigns, or their ministers, had often looked to the "fraternitie" for an exact account of City mortality in times of pest. Indeed, the smallest amount of reflection will show that the figures which are scattered through our old English historians, representing the exact amount of deaths within and without the walls, on various occasions of pest, must have been supplied by this "fraternitie," long before rudely organized. It also appears, from "Claus's History of the English Plague," that a City bill was supplied daily in the time of Henry the Seventh and Henry the Eighth, during the climax of two distinct visitations, which Friend also notices in his "History of Medicine." Not only the numbers in detail, down to the unit, along with the sex, but also the occupation of the deceased, were minutely noticed; or how could these historians insist on the curious fact, that the list of the dead at the fourth and fifth return of the pest showed that the higher classes, and particularly the nobles, suffered exclusively, the malady not reaching their varlets and the poorer orders?—results diametrically opposed to those of the first visitation, at the conclusion of the reign of Richard the Third, before and after the battle of Bosworth. The expression "*pauperum ne unicum quidem*" is too explicit to leave a doubt about the matter. Besides, Friend gives the daily amount at the culminating point, and notices that two of the sons of Charles Brandon, themselves both Dukes of Suffolk, died on the same day, so that three persons came to that title within twenty-four hours.

It might be correct to say, in a general sense, that the bill was first printed in 1592, although that also is questionable. The clerks were under the supervision of the Archbishop of Canterbury and the Star Chamber Commissioners, by whom they were kept pretty close to their duties, as the five judicious decrees subsequently published from that chamber, to extend

the area of registration from time to time beyond the City walls *pari passu* with the growing population of the out-parishes, abundantly prove, and these bearing date prior to that of the charter of James the First. In the reign of the queen who was wont to hail her loving citizens with a "God bless you, my good people," proof is extant that the monarch and her ministers, in time of pest, had the written bill supplied to them; and also that the "fraternitie" had been repeatedly threatened with the penalties of the Star Chamber for being dilatory in such supply. When the sovereign set such an example of undelegated performance of duty, the minister was bound to follow it. Hence the great minister for war or peace, Cecil, Lord Burleigh, with Catholic Europe arrayed abroad against his country, and with plots and intrigues to watch and unravel at home, could yet find time to read reports touching the lives of millions, as also could his queen. The higher amiable sensitiveness of extreme civilization may cause authority to shrink from a death-warrant, but can scarcely be so morbid as not to tolerate the perusal of documents important to health and life. This trait in the character of Elizabeth is noticed by Bishop Andrews in a sermon still extant, preached at the parish church of Chiswick, in a time of pest, on the 20th day of August, 1603, before James the First, just after his accession, evidently as a laudable example for that monarch's edification.

Neither is it correct, as the books state, that the printing of the bills, which was begun in 1592, and interrupted in 1595, having been resumed in 1603, was regularly and unremittingly continued from that period. The printing was repeatedly in arrears, though subsequently performed. The truth is, that the pest, called the English sweating sickness, which had been the prime stimulus to the archbishop, the Star Chamber and the Parliament, having ceased in 1595, then also, just as now, ceased public anxiety and interest in the perusal of these bills; and then also, as now, economy and indifference resumed their sway over authority, man being the same of yesterday, to-day, and for ever. Such will always be the result of measures originated by the wisdom of the few, and carried by the panic of the many, not firmly based on general conviction, through the agency of reason and mature reflection. The printed bills reappeared at the pest of 1602-3; but even so late as 1625 the expense of printing them, at that time most costly, caused the thrifty citizens to pause; and it was only by the combined effects of a threat from the Star Chamber, and the boon of a printer, sent to them at the expense of the archbishop, the clerks on their part undertaking to erect a printing press in their hall, that the printed bill was again set in motion, and the printer's bill of charge economically obviated. The formation of the M.S. bill was, indeed, never interrupted from 1603; neither, after 1611, could it have been, without peril to their charter, for its terms are so stringently worded, that it dies a sudden death by any, even a single week's, omission—a master-stroke of policy worthy the imitation of modern statesmen, for it made the privileges conferred to be co-existent only with the unremittingly and faithful discharge of the duties and obligations imposed—i. e., formation and preservation; and this is the reason that, although no less than six offices have been, from the first, ever supplied with these bills, the only perfect series is to be found at Parish Clerks' Hall, Silver-street. Hence, also, with energies unexhausted and inexhaustible, this company still make up their bill, maugre the more scientific one of the Registrar-General, on which it operates as a part check or voucher.

[Here follows an exact list of deficits of certain original annual bills, defects which are nearly all cured by the reprints or collections by Petty, Morris, Grant, and Heberden, and only requiring careful comparison and official verification by the parish clerk's officer; and also sundry deficits in the weekly bills, including one *hiatus valde defensus* of fifty-seven years. There is a duplicate of the list on three folio pages, taken also by the proper officer, in the museum.]

Having determined and rendered an account of the deficiencies, attention has been directed to probable means of supplying them, in order to make the series in the museum a perfect duplicate, in case of loss by fire, damp, vermin, or other mischance. To place this subject before the public in a conspicuous view, it may be stated that their public value is estimated and recorded by the greatest political arithmeticians at a price far beyond anything that could be conveniently met by any fire insurance company. Furthermore, Heberden, in the introduction to his printed collection, thus expresses his opinion of their value—an opinion at once emphatic and prophetic:—"The time will come," says this chief ornament of the College of his time, "that some one, if able and willing, shall draw

\* In a letter to Mr. Panizzi, librarian to the British Museum.  
No. 1616.

conclusions from these documents great and important to the whole nation." It remains to give a summary of research in all the state offices and libraries that held out reasonable expectation of success, and next to show beyond all doubt that conclusions of the character assigned by Heberden may be drawn, "great and important," from the bills, aided by the modern continuation of them, beyond all doubt or cavil.

The investigation began by searching at Parish Clerk's Hall, and it was through the liberality of Mr. Wheeler, the master, aided by the zealous assistance of Mr. Bullard, clerk of the company, that the greater portion of the recovered annual bills, which complete the eighteenth and (*tantum*) the nineteenth century, were effectually supplied. Nothing could exceed the urbanity and attention, experienced as well in this as in every other department, of the City authorities. The promptitude, zeal, and patience displayed in supplying official assistance, and in giving access to all documents, irrespectively of their own personal inconvenience, *promptly*, without delay or appointment, irrespectively, too, of all charges for such services, prove that they are quite alive to the importance of the subject, in which, to speak the truth, they are far in advance of the Government and of the rest of England. The supply of duplicates for the purposes of the museum, however, from the Clerk's Hall is exhausted. It may be interesting to all antiquarians, and especially so to all who take an interest in City bills, to know that, since writing on the origin of these bills, conjecture with regard to the error of assigning such origin to 1592 is changed into certainty. The master has in his possession a bill of the date of 1681-2, also one as early as 1562,\* which has been carefully examined. It was not preserved at their hall, but purchased by Master Wheeler from private hands. This bill proves all the books (as conjectured for reasons already stated) to be in error, not excepting the "Remembrancer" of their own clerk of 1665, Mr. John Bell, who first originated and recorded it.

Attention was directed at an early period of this search to the library of the London College of Physicians, with an amount of hope and confidence which ended in disappointment. The secretary of that learned corporate body stopped an inquiry *in limine*, by a written answer of positive assurance that no bills existed with them of prior date to those of the Registrar-General, 1837-8. This poverty as regards records of health is the more surprising, inasmuch as one of their most illustrious fellows did himself (as before noted) edit a reprinted collection from 1592 to 1758, and in his introduction admonished and charged the body corporate on the importance of the duty of preserving them in harmony with the express injunction of their charter, by which Henry the Eighth created them chief guardians of the public health. Of this guardianship they failed not, in aspririt commendable, to remind the Home-Secretary, who had neglected to consult them in 1848-9. Whether Heberden's expensive work was the result of his own pecuniary sacrifice, or in part paid for from the College funds, the laudable object of it is lost and forgotten by his successors, who seem to be totally ignorant alike of its existence and its history.

Reference to the catalogue of the Royal College of Surgeons of England, with research thereupon, indicates that this eminent corporate body possess Petty's calculations, Morris's tables, Heberden's and Captain Grant's reprints and glossary of the terms of the bills, and Marshall's statistics, containing a sort of summary of the annual bill of a cycle of 100 years, digested on a scheme of which Cullen's nosological arrangement is the basis, and in which the antiquated terms, or heads of disease, are rashly replaced by those of Dr. Cullen's school. Not one original bill, however, is to be seen here; only the modern serial from 1836-37. This eventuality of the research was scarcely to be expected, since they received their manipulatory charter as early as the time of Henry the Eighth; and when the light of philosophy first began to dawn upon them, from Wiseman down to Hunter, and from Hunter to their own time of surplus talent and learning, the statistical mode of developing truth has been inculcated and practised most successfully, and its application to etiology and practice generally acknowledged. Two minutes' examination of the columns would show them,

for example, that carbuncles, which have rose to a multiple of 35 within ten years, as also whitlow and other phlegmons, have always been the foreshadowers of flux-pest of mucous membrane, and therefore that these local diseases acknowledge causes in common with those of the pest.

To inquiries made at the Secretary-of-State's office, (after appointment for answer on a future day,) on a second interview with the librarian, it was candidly admitted that, although he believed that these documents had ever, by usage immemorial, been delivered in duplicate by the Lord Mayor's yeoman, agreeably with certain charters,—one enclosed and addressed to the sovereign and the other to the secretary,—they had rarely been opened as a matter of curiosity, still more rarely perused, and that the one for her Majesty had never been forwarded. The bills, in truth, had become waste-paper, never filed, but left as a perquisite for successive office-sweepers, who, even if perchance they could read them, could scarcely have been expected to carry out the royal scheme of the original charter:—"That ourselves, our ministers, physicians, and others learned in such matters, might draw therefrom arguments and proofs of the reasons and causes of growing pests, to the intent that measures may be taken to prevent or lessen the same for the comfort and convenience of our well-beloved subjects." Imitating the pedantic language of this charter, it may be inferred that the *argumentum a priori* of these respectable subordinates would chiefly turn on the previous market price of the last waste-paper sold by the pound; and their idea of an *argumentum a posteriori* would probably be selfish, circumscribed, and limited, in practical application, to their own personal comfort and convenience. It is gathered that the sealed bills have for ages been received by successive officials with the same repugnance on their part to open them, and with about the same chance of being opened, as would attend a weekly presentation of Pandora's box. Yet a salary of £20 per annum (the more expensive office of yeoman now being abolished) is still allowed for delivering these bills from the City for her Majesty and the Home-Secretary!

Search in the City Chamberlain's office ended in taking minutes of a collection handed over at the death of City Chamberlain Clarke, agreeably with instructions at his death given to his son, to be deposited for the use of the citizens at their library at Guildhall.

Search in the City Town Clerk's office (where also they have been immemorably delivered, as well the annual as the weekly) showed that none whatever have been preserved, except a part of the modern series, from 1846.

Research into the ancient documents of the office of the Bishop of London, and into the records deposited in St. Paul's Cathedral, under the control of that office, was very slow and laborious, owing to the large extent of material. From records, licences, and proclamations, it may be inferred that Bonner, in 1540, and successive diocesans, exerted power of licence notwithstanding the charter of the physicians; that they interfered in times of pest by issuing seasonable orders; that they took cognizance of the bills of mortality, and even licensed the nurses and midwives, on their oath on the Holy Evangelists, to the ordinary engagements, as may be seen by a licence to one Rose Lawrence and six others to practise midwifery, the licence being granted on an examination of the candidates' skill and acquirements, and on letters testimonial *ad id* from an eminent Fellow of the College of Physicians. The midwives, in the document, are licensed to practise within the City and ancient suburbs. The same licence also empowers them to baptize *in extremis*, enjoining them to use aqua pura, and to eschew aqua rosa, oil de rosa Damascena, and to use the Scripture words only, "*sine verbis aliis prophanis quibuscunque*." The research justifies the expectation that a collection of the bills will be found there, but it is to be feared of too early a date to meet the deficits. (Vide Lib. Bonner, page 18.)

Application at the office of the Registrar-General was met by avowal of the absence of all the old bills in that quarter, their officers having been wont to refer to the collection of the British Museum. It will be gratifying to this officer, therefore, to find, on any future visit, that the annual deficits in the nineteenth century are now supplied, and that such completion may serve to facilitate or rectify future calculations.

The Board of Health, as gathered from an interview with their late commissioner, Lord Shaftesbury, possessed not any series of these bills. A nucleus, however, has been supplied to them by a presentation of such surplus bills as have come to hand through the medium of the present inquiry, which, though consisting only of less than a quarter of a century, may serve to rivet observation to the practical value of a comparison of the old with the new.

\* The following is a copy of the titles of two bills in the possession of Master Wheeler, and verified by the clerk of Parish Clerk's Hall. They have never before been published, and till now quite unknown to the antiquarian world:—

"The number of all those that hath dyed in the Citty of London, and the liberties of the same, from 28 of December, 1681, unto the 27 of December, 1682, with the Christenings.

"And also the number of all those that have dyed of the plague in every parish particularly."

"The number that died in the time of the great plague, 1665, from 1st January to the last December, of all diseases, twentie thousand, three score, and twelve, and the plague being part of the number aforesaid, seventeen thousand, four hundred, and four. The end."

An extended search into the library and records of Lambeth Palace and the offices of the Archbishop of Canterbury, in connexion with researches in the office of the Bishop of London, promises results of such importance as to justify a distinct and future report for the public service. Those who have recorded that our ancestors had no notion of registration till 1592, have committed an error allied to that which may be seen in Heberden's introduction to the printed collection of 1758, in regard to the Greeks and Romans, whom he represents to have been equally negligent of registration. It is surprising that this learned physician could have made such a mistake, since any one moderately versed in Greek and Latin literature might have known that both nations had their registrar-general and their boards of health, as recorded in all encyclopædias under the terms "registrar" and "registration." The charge of neglect of our national records, and of the loss of five out of six perfect series which might have been preserved, can neither be exclusively fixed on the State, nor on our corporate bodies, nor on the clergy, nor on the medical profession, but on all together, and is referable to the apathy on this subject pervading mankind in general, and the English nation in particular; for Chatham, who well understood his countrymen, once remarked "that he feared it was too much the temper of this country to be insensible to the approach of danger until it comes with accumulated terror upon us."

It remains briefly but forcibly to impress on the trustees and on the public the vast importance and high value of the bills, in order to prove that time, labour, or expense have not been expended beyond what was due to the interests of society.

1st.—Not only every educated man, but even any person tolerably versed in figures, will easily gather, by comparison of the bills of the nineteenth with those of the eighteenth century, that the rate of death by flux in the two eras has changed from half a person in every 1000 deaths, to the enormous amount of one-seventh to one-eighth of the whole mortality of London, (lung flux, or bronchitis, inclusive;) and that this gradually began in the first quarter of the present century, long before the exotic cholera appeared in England.

2nd.—That in 1825, or in any intermediate period from 1800, when flux had grown to a multiple of three or four, or of eight on the normal average of the eighteenth century, any sanitary statesman, acting on the maxim of *obsta principiis*, might have easily obviated the evil, since it was then limited, and even now is not remarked in many of the rural districts, where the normal average remains nearly the same as from 1700 to 1800.

3rd.—That, as the mortality by flux steadily increased before cholera, so has it done since its various visitations, exasperated indeed by the presence of its rival, but progressing from year to year independently of it, and swelling out the figures of diarrhoea and bronchitis, the two forms of its blood-taint.

4th.—That under these two forms of blood-taint is located a mortality of 52,000 within the last ten years, within the London area, a multiple of three and a half of the amount of death by *all the forms*, included in the registrar's tables under the term cholera, in the same period, and within the same area; and agreeably with this observation, a problem has been supplied for the amount of deaths by cholera for 1854 within the London area.\*

5th.—That the force of the figures was so conclusive, that it enabled a calculator, whose name is unimportant to this report, in an anonymous paper published in *Tait's Magazine*, February, 1851, to fix 1853-54 as the latest period for the third choleraic visitation, and the Government of 1850 stood so forewarned, as well also as did successive chairmen of the Board of Health.

6th.—That these same bills enabled the same calculator, for years, to deliver to successive chairmen of the Board of Health, in the second month of the year, nearly the exact amount of the forthcoming year's mortality by flux.

7th.—That these histories in figures also enabled him to predicate a large increase of mortality for 1851, which was verified by an increase of nearly 7000 deaths.

8th.—That by the same it was easy to calculate the period of this year (1854,) up to which embarkation of our troops or of emigrants would be free from risk, and that such calculation, at an early period of the year delivered to Lord Hardinge, turned out to be really correct, as had done also those delivered to the various ministers, and to the chairman of the Board of Health.

9th.—That these figures, contrasted and supported by those of the registrar, will show, in any inquiry into the causes and

cure of choleraic pest, that however impossible it is to prevent the spread of cholera all over the world, its inviter and hot-bed with us in London and in the large manufacturing towns, is a previous condition of blood-taint flux, since the causes, be they what they may, are not operating at all in many extensive rural districts, the normal average in such rural districts scarcely having been disturbed (except lately during cholera) from 1600 to 1853.

10th.—These bills also, not in figures of speech, but in the speech of figures, preach sermons more conclusive than eloquence can devise, since if traced through the sixteenth century, it will be found that all naturalized pests have ever begun with the poor, and in later visitations have culminated to the higher classes, sometimes exclusively; and the later figures show that the calculator was right who avowed, twenty years ago, that this would be gradually the sort of progress made by cholera, just as the English sweating plague took twenty-seven years in travelling, from the "scum of Britain," who landed at Milford Haven in 1483, gradually through the middle classes, to the court and throne of Henry the Eighth in 1510, (at its fourth visitation, and afterwards at its fifth,) that menarche emerging only by the strength of his constitution. This *ascensus* nature is now insensibly repeating. He who doubts this, has only to refer to the particulars, as well to the ancient bills as to those of the bills and practice of 1832, 1849, 1853, 1854. Yet so ignorant are the many legislators on this point, that they consider it a poor man's disease, and with equal truth ascribe its causes to the poor man's ignorance; an exclusive charge which with more truth, but not altogether with justice, might be nailed on the door of nearly every living statesman. With respect to this apathy, as with the fatal consequences of it to be observed in the sequel, "He hath made the rich and the poor to meet in death," for analogy tells that our magnates have but five years left for more active efforts.

11th.—It should be added, that the objection to the quaint terms used in the older bills is frivolous, since although quite unintelligible without a glossary, such glossary is found in Grant's account of the bills; and a satisfactory explanation of them is gathered from the medical works of the older English physicians of the fifteenth, sixteenth, and seventeenth centuries respectively, in which the symptoms are recorded.

No apology need be made for the boldness of spirit which pervades this report. It is in its character a small piece of historical patch-work, and the historian hath ever claimed to be alike independent of sovereigns, and of ministers, and of public caprice, actuated by the higher notion of being the servant of the "God of Truth" and the benefactor of posterity. It contains nothing that a school-boy could not verify by the bills; it contains nothing that can admit even of doubt or cavil.

In departing from the task, it may be allowed to express the mind's wonder at the lucid order and facility with which Mr. Panizzi superintends the gigantic duties of the British Museum. If the gentlemen who write facetious paragraphs scattered through the daily press and literary journals, on the hackneyed text of "slow cataloguing," would each take a month's turn at it, any of their future remarks would, through such experience, show more judgment and knowledge of the subject, although, perhaps, their sprightliness of style would be lost by the depressing recollections of the very unusual exhaustion they will have undergone—an exhaustion (even to one used to much hard work) the greatest ever endured by the author of this paper.

Spring-gardens, August, 1854.

## CLINICAL AND CRITICAL CONTRIBUTIONS TO OBSTETRIC SCIENCE AND PRACTICE.

BY ROBERT BARNES, M.D. Lond.,

MEMBER OF THE ROYAL COLLEGE OF PHYSICIANS, PHYSICIAN-ACCOCHEUR TO THE WESTERN GENERAL DISPENSARY, PHYSICIAN TO THE METROPOLITAN FREE HOSPITAL, LECTURER ON MIDWIFERY, &c.

(Continued from p. 79.)

### ON THE TREATMENT OF POLYPUS.

A SURVEY of the opinions emitted by different practitioners will establish the fact, that the treatment of polyposis is not yet settled upon any definite principles. Dupuytren invariably practised excision; others advocate the exclusive use of the ligature. In a recent discussion at the Medical and Chirurgical Society, a great diversity of opinions was made manifest. Mr. Canning, the author of the paper under discussion, considered that the case he related "established a proof that Dr. Locock's plan of excision was preferable in all cases of hard and pedunc-

\* The problem supplied to Lord Palmerston (and published,) in 1853, is this, —As the deaths by bronchial and bowel flux in 1846-47-48 were to cholera of 1849, so flux-deaths of 1851-2-3 to cholera-deaths of 1854.

culated polypi." I think no one plan of treatment can properly be advocated as exclusively applicable to all cases. "Ni jamais, ni toujours," is a maxim of moderation that deserves to be respected in this instance as in most others. The choice of the mode of treatment must be determined by the nature of, and the circumstances attending, the particular case in hand. It is in reference to this question of treatment, that an accurate appreciation of the pathology of polypus is so valuable. If it be possible to lay down any rules defining the practice that should be followed in the treatment of these cases, the surest and the most comprehensive will be those based upon the differential characters of polypi.

It is useful to bear in mind that we are by no means restricted to a selection between the ligature or excision. Several other modes of removal may in particular cases be preferable. Torsion, breaking up by the forceps, and cautery, may often be most usefully resorted to.

Perhaps the rule of practice may admit of being thus generally expressed. Polypi of the muscular variety, arising in the cavity of the womb should be removed by the ligature; polypi of the vascular kind should also be removed by the ligature; polypi of the fibro-cellular kind, springing from the cervix uteri may be removed by excision or by torsion; polypi of the follicular kind may be removed by excision.

But the rule of practice admits of no more than a general expression. It cannot be laid down with absoluteness. Each of the propositions I have submitted must be received with a liberal interpretation. Particular facilities or difficulties may often justify a departure from the more general principle of conduct. And I think it useful to consider some of the more usual circumstances which may influence our decision.

In the case of muscular polypi of large size which have descended into the vagina, when the neck is large, and the presumption that it contains vessels of considerable size exists, the propriety of resorting to the ligature is apparent; but as the process of detachment may occupy a long time, and there is some danger of further injury to the system from the absorption of putrid discharges, it may be advisable to excise the tumour below the ligature.

Many cases of small muscular polypi still enclosed in the uterus may give rise to embarrassment. In these cases it will rarely be possible to pass a bistoury or curved scissors into the cavity of the uterus with safety; but it will often be possible to apply the ligature by means of Gooch's double canula. To facilitate the application of this instrument, it may be desirable to dilate the cervix by means of sponge-tents. When the double canula cannot be applied, it may be still possible to apply a ligature round the neck of the tumour by means of Mr. Brooke's ingenious instrument for tying knots.

In some cases it will be better to remove the tumour at once, by cutting through the neck with a silver wire, as practised by Dr. Simpson. This proceeding differs from ablation by the knife or scissors, in bruising or tearing the bloodvessels of the pedicle, and so lessening the risk of hæmorrhage.

In the case of the fibro-cellular polypi of the cervix, we are governed very much in the choice of proceeding by the size and accessibility of the tumour. If of large size, and very vascular, the safest mode is that by torsion. If not readily reached by the forceps, the instrument contrived by Dr. Loock may enable us to divide the neck. This is a kind of scoop, carried up into the cervix by means of a canula.

If of small size, and there be no fear of hæmorrhage, fibro-cellular polypi may be removed by cutting through the neck with a curved bistoury or scissors. If of very small size, they may be crushed or torn off by the forceps, or even by the finger-nail. Dr. Montgomery says he has cured some small polypi by caustic alone.

The follicular polypus, growing by a large basis from the margin of the os uteri, may for the most part be readily removed by excision; and in many cases the best mode of excision will be to cut through the neck with a silver wire, or a slender but strong ligature of silk or whip-cord.

Is it possible to cause the disappearance of fibroid tumours and fibroid polypi without having recourse to ablation? Can we hope by local and constitutional means to arrest the growth, and bring about the degeneration of these bodies? In those cases where these outgrowths have assumed a polypoid form so as to come within the reach of the surgeon, the question of removal by any other than direct surgical operations is one of little importance. But in the case of fibroid tumours still imbedded in the walls of the uterus, placed by this circumstance beyond surgical interference, the question assumes the greatest interest. The simultaneous growth of fibroid tumours with the enlargement of the womb during pregnancy, and their simultaneous retrocession after delivery, prove that the abnormal

and the normal muscular tissues may be affected by the same influences. The history of these fibroid tumours also seems to show that they have a period of active growth and vitality, followed by a period of inertness, during which they may pass into various forms of atrophy and degeneration. It is not unreasonable to expect that this period of growth may be shortened, and the advent of degeneration hastened.\* Ordinary hypertrophy of the uterine neck often yields to local and general treatment. Enlargement of the body of the uterus itself is frequently successfully treated. As a general law in pathology, the vitality of morbid growths is less vigorous than that of the healthy structures. Thus morbid growths are commonly less able to resist the operation of remedial agents. During the stage of activity of fibroid tumours, every precaution should be taken to maintain quiescence of the uterus; every stimulus to the afflux of blood, local and constitutional, to this organ should, as far as possible, be rigorously excluded. The periodical excitation attending upon ovulation and menstruation cannot, of course, be escaped from. But this is less conducive to the growth of tumours, and infinitely less dangerous than pregnancy. The latter risk may be avoided. The removal of every cause that can favour vascular activity of the uterus is, in my opinion, the leading indication.

I am not desirous of extending the limits of this treatise by entering upon a discussion of the various modes of treatment which have been employed with a view to the subduing of uterine tumours; but in postponing the consideration of this subject I would urge the importance of a steady perseverance in the endeavour to arrest the development of tumours which exhibit a disposition to grow. Discouraging as the effort frequently is, it is not always so. Experience has amply shown that the growth of uterine tumours may sometimes be controlled.

There is another point connected with the treatment which requires to be noticed. It is frequently not enough to remove the polypus in order to restore the patient to health. In many cases the polypus has, during its sojourn in the uterus or cervix, produced effects which will not disappear on the simple removal of the cause. This point had never, I believe, been sufficiently insisted upon, until Dr. Henry Bennet and Dr. Montgomery showed that the irritation and pressure caused by the presence of a polypus frequently gave rise to a great amount of congestion, inflammation, hypertrophy, and sometimes ulceration of the cervix. If these conditions be not subjected to special treatment they may still continue to keep up hæmorrhage and leucorrhœa, and to frustrate the success of the operation. It is in all cases necessary to make a careful examination within a short time after the removal of a polypus, in order to ascertain whether the uterus and the cervix have returned to their normal condition.

In addition to these secondary local effects of polypi, which often require after-treatment, the constitutional effects will almost in every case demand the most serious attention.

The law expressed in the maxim, "*Sublata causa, tollitur effectus*," would be more true with this modification: the cause being removed, the effect *admits of being removed* also. In many cases it is necessary to persevere for a long time in the cautious and steady pursuit of a reparative course of treatment. But as the treatment called for presents no feature of a special character, nor differing from that indicated in other states, in which the system has been impaired by loss of blood, and the degradation of its properties, it is not my intention to enter into any details upon this subject.

Devonshire-square, May, 1864.

\* Since this memoir was written, I have had an opportunity of reading the elaborate "Report on the Surgical Treatment of Certain Fibrous Tumours of the Uterus heretofore considered beyond the Resources of Art," by Dr. Washington Atlee. I have given an analysis of this work in the Quarterly Report on Midwifery in the *British and Foreign Medico-Chirurgical Review* for July. The possibility of bringing about the degeneration of fibroid tumours artificially has been illustrated by Dr. Atlee in a series of cases, of which it is not unjust to say, that they are more remarkable for audacity in treatment than success in result. His principle of proceeding is thus expressed:—"These tumours are very imperfectly organized; consequently their vitality may be very easily destroyed. A section made through their thin investing membrane will sometimes be followed by the death of the whole mass. This may be owing to the admission of atmospheric air causing it to degenerate. Indeed it would appear that the action of the oxygen of the air, like a portion of yeast in a fermentable mass, may originate in any part of a fibrous tumour an action of cremaculus, which may extend throughout the whole." Acting upon this view, Dr. Atlee has treated many tumours of enormous size, imbedded in the walls of the uterus, by free incisions carried into their substance, and attempts at enucleation by the aid of instruments, and repeated doses of ergot of rye. Some of the tumours have thus been more or less broken up, and more or less completely removed. In some cases death has followed the operations. I think the change which took place in the tumours operated upon by Dr. Atlee was mortification or gangrene rather than degeneration, properly so called, or cremaculus. I doubt very much whether the history of the cases reported by Dr. Atlee afford much encouragement to follow his example. There must be few women whose constitutions, previously shattered by exhausting hæmorrhages, would be able to survive the severe and protracted and repeated operations recommended by that courageous practitioner.—August, 1864.

ON THE  
TREATMENT OF DIARRHŒA, WITH REPORTS  
OF TWO CASES OF SPASMODIC CHOLERA.

By W. LAWSON, Esq., L.S.A., &c., Cleveland-street, Fitzroy-square.

In the ordinary cases of diarrhœa, of which there have been, within the last month, many hundreds in my practice, I have generally found the following (universally I might say) successful:—To an adult labouring under a severe form of diarrhœa, with pain in the bowels, frequent dejections, at first dark, and afterwards rice-coloured, I give calomel, five grains; powdered opium, a grain and a half, in two pills; and follow it up by a mixture of prepared chalk, two drachms; aromatic confection, a drachm; powdered gum acacia, two scruples; tincture of catechu, half an ounce; compound spirit of ammonia, two drachms; essence of ginger, a drachm; cinnamon-water, to six ounces. Mix. A fourth part to be taken after every loose dejection, adding according to circumstances, ether, and tincture of opium. If there is vomiting, I direct sinapisms to the chest and belly; if cramps, to the feet and calves of the legs; forbidding all slops, and directing cold brandy and water, and solid aliment. When the diarrhœa is subdued, great care is necessary to restore the biliary secretion, by small doses of mercury with chalk, with a sedative, such as extract of hyoscyamus, and a gentle aperient of magnesia and rhubarb.

For children under six years of age, I have generally been successful with the following:—mercury with chalk, three grains; Dover's powder, two grains: mix for a powder; and compound chalk mixture without the opium; sinapisms to the pit of the stomach.

For food:—New-laid eggs and bread; thick arrowroot with brandy, as with adults. No slops, excluding even beef-tea, until the diarrhœa is stopped; then beef-tea, with a little portwine and arrowroot mixed.

During the present epidemic, I have treated only two cases of well-marked Asiatic cholera.

CASE 1.—A female, fifty-two years of age, very fat, and asthmatic, living in a kitchen, under which there is a cesspool, said to have been there without being emptied for upwards of thirty years. I was called to her on Sunday, July 16th, at five P.M. She had cooked the family dinner at two o'clock, and had eaten freely of roast lamb and green peas, at which time she appeared in her usual health. About four, she became very sick, vomited freely, and was once purged. I saw her at five o'clock; she was then cold as ice, painfully so to the touch; the skin perfectly blue; without pulse, and without voice; still sick, but as I learnt, had not been purged more than once, the quantity about two quarts. I directed brandy and water to be given in large quantities; turpentine and hot water applied to the stomach; sinapisms to the feet, and had the legs, arms, and hands rubbed with turpentine embrocations. At six o'clock, she had somewhat recovered; but the vomiting and pain continued. The fingers and toes were contracted; cramps and spasms of the legs and stomach. I then ordered the calomel and opium pills, and the chalk mixture, with ether and laudanum. About ten o'clock the pain and cramps had ceased, as well as the vomiting. The surface became warm; a hoarse whisper could be heard; there was still no purging, nor had there been any secretion of urine. At twelve o'clock all the symptoms were mitigated; the skin was warm; the pulse free; the voice better; cramps only occasional; still no secretion of urine. I ordered a repetition of all the measures, frictions, sinapisms, brandy, &c.

July 17th.—At eight A.M. she was still improving, but seemed lethargic. I discontinued the opium, and ordered the other means to be continued, but being called away, I found on my return at six P.M., that supposing her much better, their application had been suspended, and the stage of collapse had returned. She never again rallied, and at twelve o'clock she died, without either vomiting or purging.

CASE 2.—A man, thirty years of age, living in a confined and unhealthy situation, in a house charged with the filthy exhalations of privy and cesspool, was seized with cramps and vomiting on the 5th of August. When I saw him first, he was cold, blue, and pulseless, the eyes sunk, and the face with an expression of horror and fear, firmly impressed with the idea of cholera and death; there was violent pain in the stomach and bowels; fingers and toes contracted; cramps in the legs, and no urine had passed. I gave two calomel and opium pills, and the following mixture:—Spirits of camphor, two drachms; oil of capcut, thirty drops; tincture of opium, fifty-five minims; peppermint-water to six ounces. Mix. An ounce every two hours. Turpentine applications, sinapisms, brandy

and water, and solid diet, frictions to the feet and legs. These remedies were continued with slight variations for nine days, and the patient has recovered, but continues very weak.

In many cases of diarrhœa I have tried the diluted sulphuric acid, but have never seen any benefit from its use, unless perhaps on a few occasions, when it seemed to check vomiting.

I am perfectly aware that the cases related are of a very ordinary kind, and I only mention them as confirmatory of the opinion I have always held, that diarrhœa is not a precursor of Asiatic cholera. In 1849, I attended upwards of 3000 cases of the severest species of diarrhœa, without one becoming cholera; and I saw in that year upwards of 100 cases of genuine Asiatic cholera, not one of which had been preceded by diarrhœa.

This year I have seen many hundreds of cases of diarrhœa, which have been easily subdued; and I have only seen these two cases of cholera, neither of which have arisen as consequences of diarrhœa.

## TREATMENT OF CHOLERA AND DIARRHŒA

IN THE  
VARIOUS HOSPITALS, INFIRMARIES, AND DISPENSARIES IN THE METROPOLIS.

No. I.

### MIDDLESEX HOSPITAL.

By Wednesday last, ten cases of cholera in an advanced stage had been received into this hospital during the prevalence of the present epidemic. Of these, five have already proved fatal; but it is remarked by one of the resident medical officers, that the disease at its present visitation has put on such unusual violence, and run its course with so much rapidity, that little hope of recovery has existed where the cholera has reached any advanced stage. The preliminary diarrhœa has speedily been succeeded by collapse, the intermediate stages noticed in former visitations having been altogether absent, or so transient as to be little observable. The usual treatment here of cholera in its malignant form is, first to administer a very full dose of calomel, (from ten grains to a scruple,) which is laid upon the tongue with little reference to the quantity, except a discretionary administration relative to the age of the patient, who is as soon as possible afterwards placed in a warm bath, where he remains from twenty to twenty-five minutes, or until some degree of reaction is restored. After this, two grains of calomel are administered every two hours, and alternately with this dose, Stevens's saline mixture,—consisting of chlorate of potash, six grains; chloride of sodium, a scruple; sesquicarbonate of soda, half a drachm; water, an ounce and a half,—is given. The latter mixture is also injected per anum, and during this part of the treatment, cloths wrung out of hot water, and sprinkled with turpentine, are laid over the region of the bowels. For the advent of the disease—the stage of diarrhœa—the treatment pursued has been to administer about forty minims of dilute sulphuric acid every half hour for the first six doses, and afterwards once every six hours, in conjunction with strong peppermint-water, and the results of this treatment have been, as we learn, in the highest degree satisfactory. The number of patients treated in this way for diarrhœa has been considerable; but as they are mostly out-patients, no record has been kept of their cases. Whenever the diarrhœa has merged into the stage of collapse, they have promptly been received into the hospital, and subjected to the mode of treatment first-mentioned above. On Wednesday, three patients treated with the dilute sulphuric acid, after being in a state of collapse, were reported in a fair way for recovery.

### ST. MARYLEBONE GENERAL DISPENSARY, WELBECK-STREET, CAVENTISH-SQUARE.

At this institution, Dr. Armitage informs us that no cases of genuine Asiatic cholera have been presented for treatment. Instances of choleraic diarrhœa have, however, been numerous, and subjected to treatment with ordinary chalk mixture, chalk with opium, or catechu. In a short time the disease has succumbed to these remedies.

### WESTMINSTER GENERAL DISPENSARY, GERARD-STREET, SOHO.

MR. ROBERT WADE, in cases of simple diarrhœa, is in the habit, when the motions indicate sluggishness of the liver, of giving a mild dose of blue-pill, and the following mixture:—Sesquicarbonate of ammonia, powder of rhubarb, of each half-a-

drachm; sesquicarbonate of soda, a drachm; oil of peppermint, six drops; white sugar, one drachm; compound tincture of camphor, and compound spirits of lavender, of each three drachms; distilled water, eight ounces; of this three tablespoonfuls are given every four hours.

When the cases are more severe, and the motions watery, the following is administered:—Dilute sulphuric acid, three drachms; syrup of ginger, half an ounce; peppermint water, eight ounces. Three tablespoonfuls after each liquid motion.

In addition to this, a one-grain opium pill is given at bedtime, and strong mustard plasters applied over the entire abdomen, and kept on as long as the patient can bear them.

#### WESTERN GENERAL DISPENSARY,

LESSON-GROVE.

THE ordinary treatment adopted here, for diarrhoea, in children under seven or eight years of age, consists of a mixture of the following composition:—Prepared chalk, powdered gum acacia, aromatic confection, of each an ounce; caraway water to eight ounces; of which two drachms are given every four hours.

For adults the same mixture is ordered, with the addition of half a drachm of tincture of opium to the eight ounces. Or else:—Dilute sulphuric acid, two drachms; compound tincture of cardamoms, half an ounce; water, seven ounces and a half. Mix. An ounce to be taken every four hours.

About 1000 cases of diarrhoea have been treated during the last month. We have no returns of cases of genuine Asiatic cholera under the care of the medical officers of this establishment.

#### INFIRMARY OF ST. GILES AND ST. GEORGE.

MR. BENNETT, the senior surgeon, states, that in mild cases of diarrhoea, the ordinary prescription has been a mixture of aromatic confection, compound spirit of ammonia, (or of sulphuric ether,) chalk mixture, peppermint water, and tincture of opium; the doses graduated according to age. When there has been great irritability of the stomach, and vomiting, a pill of calomel and opium has been given, and no drink suffered until an hour after taking the pill.

Dilute sulphuric acid has not been used, as the preceding remedies have been found successful.

When cramps have occurred, frictions, mustard plasters, and hot wet cloths, sprinkled with turpentine, have been employed; the latter applied, according to circumstances, over the limbs or the abdomen. In severe cases, two grains of calomel, with a quarter of a grain of opium, are given every two hours, and brandy freely.

Two cases of Asiatic cholera have been attended out of the house by the medical officer. They were a husband and wife, living in Church-lane, one of the very worst localities in the parish of St. Giles. The treatment recommended for the former was not carried out, and, indeed, when first visited the man was in collapse and speechless, and the case rapidly proved fatal. The wife was treated with brandy; the mixture first above-mentioned; calomel and opium; mustard plasters and turpentine externally. The treatment was so far successful, that her life was prolonged through a state of collapse lasting sixty hours, but she subsequently sank from the consecutive fever, dying on the eighth day of the choleraic attack.

#### PUBLIC DISPENSARY,

CAREY-STREET, LINCOLN'S-INN-FIELDS.

FROM fifty to sixty new cases of diarrhoea have been attended here during the present month. One plan of treatment adopted has been, at the outset, the administration of two grains of calomel with eight of rhubarb, followed by a mixture, of which ammonia and tincture of opium are the chief ingredients. At other times, the two following formulæ have been made use of:—Chalk mixture, decoction of logwood, equal parts, with five minims of tincture of opium, every four hours; or, chalk mixture, with five minims of tincture of opium, four grains of carbonate of ammonia, and a drachm of tincture of catechu, for a dose.

In certain cases two grains of calomel, with a third of a grain of opium, were followed by an ounce of castor-oil. No cases of confirmed cholera are reported.

#### ST. MARTIN'S-IN-THE-FIELD'S WORKHOUSE.

IN a communication received from Dr. Bainbridge, medical officer of St. Martin's-in-the-Fields, he says:—

"I have to state, that up to the present time we have not

had more than the usual amount of diarrhoea at this season of the year, and not, as yet, one case of Asiatic cholera.

"My usual treatment in these cases of diarrhoea, where there have been frequent dejections, with violent gripping pains and sometimes sickness, has been to administer one or two grains of solid opium, followed up by chalk mixture, five ounces and a half; tincture of opium, a drachm; tincture of catechu, half an ounce; aromatic confection, a drachm and a half. Two tablespoonfuls to be taken every hour. This has generally acted like a charm. In this stage the disease is completely under control.

"In 1849, I had a district of the parish assigned to me as well as the workhouse, and, from March to October, I attended 1669 cases, the principal part being in August, September, and October; out of these I had twenty-seven deaths.

"Where the deaths occurred, with one exception, the patients, when I first saw them, were labouring under vomiting, rice-water purging, the peculiar sepulchral hoarseness, suppression of urine, cold tongue, breath and surface, cramps, blue skin, and were sometimes nearly pulseless, indeed, in complete collapse.

"To several of these I gave large quantities of ammonia and brandy. In some I tried dilute sulphuric acid; in others, Dr. Ayre's plan of scruple doses of calomel every ten minutes, mustard poultices, frictions, &c., but no remedies appeared to have the slightest effect, as there was no absorption.

"The conclusion to which I have come from actual observation of this disease is, that the remedies I have mentioned are almost specific in ninety-nine cases out of one hundred, if given sufficiently early. Where the patients are nearly pulseless, with rice-water motions and general collapse, I believe all remedies are unavailing."

#### COLDBATH-FIELDS PRISON.—HOUSE OF DETENTION.

THERE have been no cases of cholera under the care of Mr. Wakefield; but from the 24th of July up to this time there have been 133 cases of diarrhoea, most of them attended with sickness. The stools have generally been of a bilious character, but in some instances there was a deficiency of bile; in none was there any appearance of rice-water evacuations. At first, in most of the cases, there was a feeble pulse, with coldness of the tongue and extremities, and violent pain in the abdomen. All of the cases soon recovered. The treatment in every instance was as follows:—A scruple of the sesquicarbonate of soda in a wineglassful of strong mint tea, repeated every half-hour, if necessary; sinapisms to the abdomen. The diet consisted of beef-tea for dinner, and cocoa night and morning.

At the House of Detention, also under the care of Mr. Wakefield, there has been no cholera, and only one or two cases of ordinary diarrhoea, which soon recovered.

#### ST. GEORGE'S, SOUTHWARK.

MR. J. W. WAKEM writes:—"I beg to inform you that I have treated 400 cases of diarrhoea, and 28 of cholera, since the 26th of July, in the London-road district of St. George's, Southwark; 6 cases of diarrhoea proved fatal, of which 3 were previously debilitated, and 3 passed into cholera; the remainder recovered, most of them speedily. Of the 28 cases of cholera, 12 died in from twelve to forty-eight hours; 3 fresh cases are now under treatment; of the remainder most are convalescent. In one case paralysis of the left arm occurred, and the patient (a muscular young man, about twenty-five years of age) has now, twelve days after attack, but partial use of it, but is daily improving. In this case the patient was in a state of collapse in half an hour; he also suffered extremely from cramp in his stomach, legs, and arms, for two hours.

"Symptoms (Diarrhoea).—Purging in most cases has been very frequent, attended with severe tormina, and in many cases cramps in the stomach, bowels, &c.; motions, from pale yellow to rice-water; in about a third vomiting has been very severe. In diarrhoea I have found the following pills more effectual than any other medicine:—Powdered opium, capsicum, camphor, and calomel, of each half a grain; commence with two pills, afterwards one to be given after every liquid evacuation.

"I have not found the dilute sulphuric acid generally succeed; but in some few cases I have used it, combined with opium and decoction of logwood, when the disease has assumed a somewhat chronic form. I find very large mustard sinapisms of the greatest service in all forms of diarrhoea and vomitings, whether or not attended with pain or cramps. They should be applied

directly to the skin, and sufficiently large to cover the whole of the abdomen.

"In the treatment of cholera, I have never found any medicine that I could positively say has been of any use. In the stage of collapse I am in the habit of giving plenty of saline diluents."

#### BLOOMSBURY DISPENSARY.

*Cases of diarrhoea.*—From July 1st to July 15th, 1854, 7; from July 16th to July 31st, 23; from August 1st to August 15th, 103.

*Cases of cholera.*—From August 1st to August 15th, 1854, 3.

*Treatment: Diarrhoea.*—Thin broth; calomel, half a grain; rhubarb, three grains; in a pill; followed by three drachms of castor-oil. Afterwards,—Chalk julep, one ounce; nitrate of potash, five grains; Dover's powder, three grains; three times a day. Every case, without a single exception, has yielded readily to this plan of treatment; and, in several instances, it has effected a speedy and permanent cure where the astringent method had failed to afford more than temporary relief, either the diarrhoea having returned, or headache, coated tongue, pain in the epigastrium, and other symptoms of biliary derangement having supervened.

*Cholera.*—Salt emetic, (two ounces of salt to half a pint of water;) calomel, one grain; rhubarb, three grains; every hour. Chloride of sodium, one scruple; chlorate of potash, five grains; bicarbonate of soda, ten grains, every two hours. Cold drinks. Warmth to the extremities.

Of the three cases thus treated, two, both occurring in children of the same family, proved fatal. The treatment was followed, in one, by copious bilious evacuations, return of pulse to the wrist, and of warmth to the surface, perfect relief from cramps and spasms, and restoration of the renal secretion; but the patient died a week afterwards from exhaustion. The other child did not rally from the stage of collapse. The family were living in a wretched kitchen, surrounded by faecal emanations, and nearly in a state of starvation. The third case was that of a woman, who has recovered under the calomel and rhubarb, and saline treatment.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

##### ENGLISH STATISTICS OF HOOPING-COUGH.

BY EDWARD SMITH, M.D.

(Communicated by Dr. B. JONES.)

THIS was a statistical inquiry into the frequency, age, sex, temperature, and mortality of hooping-cough, as deduced from the Registrar-General's returns. The following are the author's conclusions:—

1. *In reference to its frequency.*—In the London district, the diseases which are more fatal are phthisis, pneumonia, bronchitis, typhus, convulsions, and scarlatina, in their order. In all England, in 1847, diarrhoea was added to this list, and their order varied. There was greater diversity in the great registration divisions, both as to the precedent diseases, and their order of mortality. The proportion to the total mortality in London is 1:29.6; in all England, in 1847, 1:45.7; and varying, in the great divisions, from 1:28.1, in the eastern, to 1:94.8 in the south-western: it is as 1:181.4 of the total population. The most fatal years from 1844 to 1853, in London, were 1849 (45 per week) and 1853 (50 per week); and although both these years had high general mortality, the mean mortality from hooping-cough was not due to that circumstance. The lowest mortality was observed in 1844 (25 per week), and that did not correspond with the general mortality.

2. *In reference to age.*—It is a disease essentially of dentition of the first series, and, under one year, is the most fatal of all diseases. It thus differs from all other members of the zymotic class.

3. *In reference to sex.*—The mortality is more prevalent in females at every period of life, and this prevalence increases as life advances. It does not thence follow that the disease itself is more prevalent in that sex; but if it be so, it is prob-

ably due to the susceptibility to impression, and the power of passive endurance, which characterize the organization of females.

4. *In reference to temperature.*—The degrees of temperature, and the number of deaths, are in the inverse ratio to each other. The greatest mortality is observed in the first quarter, and also in the winter half of the year; and the least mortality in the third quarter, and the summer half-year. The maximum mark is about April, and the minimum about August, and the mortality passes from the latter to the former in uniform waves. The highest temperature precedes the lowest mortality by about a month. The line of temperature separating high from low mortality is 48°. The waves of the greatest intensity of mortality occur every second year, being then 76 and 74 cases per week, in contrast to 47 and 52 cases per week observed in the highest mortality in the alternate years, or those of recession. After a severe outbreak of the disease, there is diminished intensity, and lessened temperature does not then produce its ordinary effects. As the year of recession leads into that of intensity, the intensity becomes so great as to move in advance of, and not in the rear of, the lines of temperature, contrary to the established rule. The deductions in reference to hooping-cough do not correspond to the general mortality; they are directly opposed to the zymotic class, and have little relation to the nervous class, but exhibit a remarkable correspondence with the pectoral class, (excluding phthisis.) This latter fact indicates a close analogy between fatal cases of hooping-cough and chest affection.

##### A PATHOLOGICAL INQUIRY INTO THE EFFECTS OF SYPHILIS UPON THE UTERINE ORGANS, AND THE RELATION AND PRACTICAL IMPORTANCE OF VARIOUS UTERINE ABNORMALITIES.

PART II.

BY F. W. MACKENZIE, M.D. LOND.

THIS was a continuation of Dr. Mackenzie's communication read to the Society at the last meeting on June 13th. The former paper consisted of a detailed history of the several uterine lesions following syphilitic infection; the present comprised an account of their several pathological relations, and their practical importance.

##### ON SOME POINTS OF PATHOLOGY AND PHYSIOLOGY.

BY S. F. STATHAM, ESQ.,

Assistant-Surgeon to University College Hospital.

*Supplementary Observations on Low Inflammation.*—The author commenced by alluding to the rarity of experiments performed by the inoculation of putrid fluid into animals, and he gave the results of his own observations in some carefully drawn-up tables. The latter part of the paper consisted in remarks upon low inflammation, action of chloroform, development of cancer, &c., in which the author's views were ably stated.

#### Reviews and Notices of Books.

A *Manual of Practical Therapeutics, considered chiefly with reference to articles of the Materia Medica.* By EDWARD JOHN WARING, M.R.C.S.E., H.E.I.C.S. Fcap. 8vo, pp. 766. London: Smith, Elder, and Co. Bombay: Smith, Taylor, and Co.

THE author, or rather as he styles himself, the compiler, of this book informs us in his preface, that it is not his intention to compete with any of the established works upon *Materia Medica*, but rather to develop one of the most important aspects of that science, and in fact the only part of it bearing directly upon the employment of drugs in the treatment of diseases—viz., the medicinal qualities of the materials employed. Whilst not omitting the botanical and chemical characters of the agents of which he treats, he dwells most fully upon their ascertained effects upon the human frame in various states of health and disease. This important view of the subject has certainly been barely treated in some of the most popular works upon *Materia Medica* with the consideration which it demands, and there is therefore (we would incline to think) just ground for the idea that there was room for such a work as the one before us, without in any degree exposing the author to the charge of book-making.

Consisting, then, as this Manual does, of a summary of the medicinal virtues imputed in different quarters of the globe to drugs of all classes by various observers, whilst giving the compiler credit for his industrious researches, we must remember that, if we accept all the results as ascertained facts, we shall be in great danger of meeting with disappointment, as many properties insisted on most strenuously by one observer, especially if he be the introducer of a drug, are negatived upon its more extensive trial. This has been forcibly illustrated in the case of many medicines, even of late years, which, after having run a promising but brief career, have quickly subsided into their original obscurity.

On the other hand, it is perhaps too much the fault of most men in active practice, that not feeling disposed to burden their minds with the long list of drugs which they are nominally supposed to be acquainted with, they confine themselves to the use of some very few medicines in whose favour they have been prejudiced by habit and education, and neglect the employment of many which in certain cases are not efficiently replaced by those used.

Hence arises that routine practice which, useful as it doubtless is in getting over a great deal of work in a short time, is probably exceedingly prejudicial to a truly scientific practice of the healing art. Mr. Waring's production will, in this respect, be calculated to do good by presenting, in a concise form, the information which the medical man requires in order to guide him in prescribing the most suitable remedies.

Wherever properties which are not universally recognised are ascribed to any plant or mineral, the authorities are given who have witnessed such effects, and the reader has thus an opportunity afforded him of determining in his own mind the degree of credence he is disposed to attach to their assertions upon the subject.

It is not a little curious, in looking over the recorded opinions of different authors upon the properties of some drugs, (especially when, as in the present work, we have them, for reference, arranged side by side,) to observe the discordance in the estimate formed by each of the value of an individual remedy, and in no instance is this more apparent than in the case of the ergot of rye.

"The opinions of writers upon the value of ergot," says Mr. Waring, "are very diversified: Le Mercier Lysancourt, Beclard, Barret, Legonlaia, Desmoureaux, Gardien, Capruen, Jackson, and Hall, declare the ergot to be inefficacious; and Madame La Chapelle affirms, after long experience, that 'its innocence is its great virtue.' On the other hand, Drs. Houston, Hoessack, Holcome, and others, object to its use on account of its extremely active and deleterious property; whilst a third class, including Michell, Church, Godwin, Desgranges, Dewees, Davies, Clarke, Mackenzie, Blundell, Jewell, Churchill, Wright, and the great body of practitioners, regard it, when properly administered, as a safe, efficacious, and useful remedy. These differences of opinion are explainable only in the following way: the first class either used too small a dose, or employed an inferior article; the second class administered it in too large or too frequently-repeated doses; whilst the third class hit upon the happy medium."

This *may*, perhaps, be the true explanation of the difference of opinion upon this point, but it seems a strange fatality that either of the eminent authors above cited should have been, in a series of cases, uniformly at fault in either the dose or the quality of his medicine, especially where his observations extended over such a period of time as would lead one to suppose that he must inevitably have done right sometimes, if only from accident. Probably a better explanation may be found in the recollection of the fact that, of an occurrence in which two people are engaged under similar circumstances, each may give an account diametrically opposite in many points to that of the other, and each be equally confident of the truth of his own assertions. Mr. Waring's manual will, we think, obtain favour with the medical public, for the extent and usefulness of the information it contains, as well as from the fact of its filling a gap which has been much felt by many.

*A Treatise on Diseases of the Lungs, having especial reference to Consumption; including Diagnosis and Treatment.* By ANTHONY WILLIAM CLARKE, M.D. London. 1854. pp. 259.

DR. CLARKE'S work has been written during a certain leisure attained by retirement from professional duties, and from a desire to embody in a volume the results of experience acquired in a practice of tolerable extent. The author evidently has had very considerable experience at the bed-side, and appears to have felt more interest in the pathology of children than many of those who yet having ample means for the study of pediatrics usually do. We cannot say that Dr. Clarke's treatise comes up to the *scientific form* late works on pulmonary affections have been made to assume, nor can we free it from the imputation of being rather diffuse in its descriptions, and as not much increasing our store of information upon the subjects of which it treats. Nevertheless, it is a true and faithful record of clinical experience, gained chiefly through (though by no means alone) certain old-fashioned methods of observation now by far too frequently the fashion to disparage and deny. As such, all those who do not think auscultation and percussion are everything, but that in the observation of the expectoration, the general habit and character of a patient, his strength, powers of digestion, and signs of this character, much valuable diagnostic aid lies, will thank Dr. Clarke for this revivification of extended and minute clinical experience. We would not be thought to imply that the methods of Piorry and Laennec are ignored by the author, the contrary being the fact; but rather to show that in his treatise they by no means, as in too many, form the major portion of the subject upon which the author dilates.

## WHAT IS CHOLERA?

*To the Editor of THE LANCET.*

SIR,—This question has been often asked, but never satisfactorily answered. The various causes assigned appear to have no foundation. Is cholera (as some assert) a malignant fever, which kills in the cold stage? May not the following explain cholera. Cholera depends for its essential cause on obstructed hepatic circulation, induced by some external atmospheric condition acting on the blood, by which it is poisoned (as in yellow fever.) It is not sufficiently oxygenized, or, in plainer words, it is saturated with vegeto-animal, or some other malaria, which prevents it from assuming its arterial and vital character: hence congestions, in all the spongy viscera particularly. The blood from the abdominal viscera not finding an easy transit through the liver, the result is hyperhæmia, or congestion in the intestinal organs, inducing irritative diarrhoea, which, if not checked—the evil continuing—the veins and exhalents become loaded, and the blood serum is poured out in the form of rice-water evacuations, to be followed up by death from the system being drained of the vital fluid: hence the solid parts of the blood remaining—an easy solution is found for dyspnoea, impeded circulation, leaden hue, cramps, and all the horrid train of choleraic phenomena—vessels loaded with pitch-like blood, &c. No pathologist, under such a view of the case, can wonder at the frightful mortality of this plague. Sir D. Barry said, Cure the diarrhoea, and you cure the disease. This may be true, but I say, relieve the hepatic obstruction, and you will, in all probability, cure the cholera. To this end I would recommend calomel internally, ammonia, ether, peppermint, with other stimulants, (of which hundreds have been recommended,) camphor, and *hyoscyamus* in preference to opium; this latter certainly appears to check hepatic secretion. At the same time I would rise frictions, with oil of turpentine and camphorated mercurial ointment.\* All action must be from within, I therefore do not place much reliance on external warmth, except by covering with blankets.

The post is about to close, so I must stop. I have written this "curiente calamo." Cholera is near us; it is now killing its thousands at Barbadoes, and I fervently pray that the Great Disposer of events will turn this curse from our shores.

I remain, Sir, yours &c.,

JOHN FURLONGE, M.D.

Antigua, July, 1854.

\* See Dr. Ayre's Reports, and also Dr. Davey's excellent paper, in late LANCETS.

# THE LANCET.

LONDON: SATURDAY, AUGUST 19, 1954.

ATTACK from rivals and imitators is certainly nothing more than THE LANCET might always have expected, and this homage it has constantly received during its long and prosperous career. Such hostility is one of the tributes rendered to its success as a medical journal, and forms one of its best titles to the confidence of the profession. When we receive manly and open blows, none can be more ready than ourselves to meet and parry, and, if need be, to return them with interest. But when, as on recent occasions, the virulent assaults of our enemies exceed all the license of honourable warfare, we have little care to answer, resting satisfied that such attacks harm our opponents more than ourselves, and that they are, by the revulsion they cause in the professional mind, one of our best sources of defence.

More especially do we feel obliged to them for their constant reference to the past history of THE LANCET, because we are sure that, notwithstanding some faults and errors necessarily incident to such an undertaking, the main principles, intention, and execution of THE LANCET are those alone upon which a medical press could have served the profession as THE LANCET has served it during thirty years. It has been a particular labour of love on the part of our contemporaries to exhume the unhappy quarrel between Mr. BRANSBY COOPER and ourselves. We referred to this subject last week, and we do so again on the present occasion, to show that we have no desire to shun the question.

The Editor of the *Association Journal*, instead of addressing himself to the serious question of his own veraciousness, digs away at THE LANCET of twenty years ago with a most edifying diligence, and we dare say he may learn something worth knowing in the process, as a reward for his pains. Animated by the most pious desire to promote concord and brotherly love throughout the profession, he labours like a Hercules to reproduce long-buried feuds, and besmirch them with gall and bitterness. Week after week he whines forth a pious approval of Providence for giving him, in recent events, such an excellent opportunity of taunting us with retribution. His alluvial second, "that ill-conditioned person" described the other day in Westminster Hall by Sir ALEXANDER COCKBURN, also cries out "an eye for an eye, and a tooth for a tooth," and declares that he holds Mr. COOPER's "ghost" in his keeping, and could frighten us very dreadfully, if he would.

Let the whole matter respecting Mr. BRANSBY COOPER be re-discussed. We have no objection, quite the contrary. Twenty-five years ago our hospitals were as sealed books to the medical public, and THE LANCET entered upon a contest with the hospital authorities for the publicity, before the profession, of all important matters respecting hospital practice and proceedings. There was no place in which this contest raged more fiercely than at the then united Hospitals of Guy and St. Thomas. THE LANCET was formally excommunicated by the authorities. Hospital surgeons met, and subscribed their money freely to put down THE LANCET and ruin its editor. Students or medical men daring to supply information respecting hospital practice or management, for publication,

were ignominiously expelled. Our accredited reporters were grossly insulted and mobbed wherever they showed themselves. They could not attend the medical societies without subjecting themselves to insult. We contended then, as we contend now, that the struggle in which we were at that time engaged was a most righteous one for the profession. After an abundance of aggravation, a member of our staff reported an unfortunate operation of Mr. COOPER in exaggerated terms, and demanded that a full account of it should be given to the profession. Mr. COOPER, though a man of an amiable disposition, had distinguished himself by a bigoted antipathy to medical publicity. Thus the matter arose. Personally, the Editor of this journal could have had no ill-feeling towards Mr. COOPER, but when the fight began, he was bound to support, to the best of his ability, principles which he believed founded on truth and justice, and to defend himself and property, when both were attacked. Mr. COOPER was injudicious enough to commence an action against us for libel, and thus his case acquired, not the professional publicity for which we had contended, but a publicity which he and his friends ever afterwards deplored. The motives which urged on this trial were well known. It was thought it must ruin THE LANCET. It was more with a view to the destruction of this journal than the vindication of Mr. COOPER's character as a surgeon, that the action against ourselves was urged on. That was the real stake pledged and played for in this contest. It subsequently turned out otherwise than the promoters of the trial had supposed, but this was an after and dearly-bought wisdom.

But what was our offence in this matter? A reporter of this journal sent to us a description of an operation of lithotomy, and a fuller account was demanded of the parties concerned in the operation. Our pages were open to Mr. COOPER for any corrections he might have chosen to make. That inquiries into the hospital practice of that day were necessary may be inferred from the fact that parties are now living who saw, at one of the Borough hospitals, two children cut for stone in successive weeks by the same surgeon, when no stone existed! We might, in Mr. COOPER's own case, with a view to injure him, have demanded an inquest and a coroner's jury. By using the means which have recently been resorted to, a verdict might easily have been obtained against Mr. COOPER, and against those who held the staff or handed him his instruments. But it never entered into our minds to commit such an iniquity. If we had done so, we should indeed have effected, or, at all events, have deserved to see, the ruin of THE LANCET. We might have set a shar lawyer to "furrage out" evidence, and feed some unscrupulous counsel opposed to Mr. COOPER; but all we sought was that the case should be candidly laid before the profession by the operator himself. The public trial was, we repeat, his own act, and for the consequences he and his friends were alone responsible. Mr. COOPER subsequently saw his folly clearly enough. Looking back at this distance of time, we are astonished that any man should have committed such an error. His great uncle, Sir ASTLEY, applauded the principles and objects of THE LANCET. He was not afraid of publicity or medical journalism.

There is one point connected with Mr. BRANSBY COOPER's trial, which has never fairly been placed before the profession, and to which we will now allude. In the production and publication of the imperfect report of Mr. COOPER's unfortunate case of lithotomy, we ourselves had no more than

a general responsibility as the Editor of this journal. We did not personally write it, though we readily undertook to defend its author and the principle he represented. The report in question was written by Mr. LAMBERT, a contributor to this journal, and than whom a nobler nature was never connected with the medical or any other press. He was no mere hireling, but he entertained a profound conviction of the abuses which the want of publicity fostered in our hospitals, and he possessed a spirit to dare their reform, whatever the risks might be to himself. When the report of which Mr. COOPER complained was written, he had been stung to bitterness by the scorn and contumely exhibited towards him, as the representative of THE LANCET, on the part of the hospital surgeons of that day. Ultimately Mr. LAMBERT, while almost a youth, died of a broken heart, worn out by the persecutions and ill-treatment he had received in the performance of what he considered a lofty and sacred duty. Mr. LAMBERT and Mr. BRANSBY COOPER were the two representatives of an era in which the great battle respecting hospital publicity was fought and won. Mr. LAMBERT died in the fight, as we have described; Mr. BRANSBY COOPER, whom we are accused of destroying, died of cancer, at the age of sixty-seven, and the worst injury he received in the contest was, that he did not after his trial reach that pinnacle of eminence to which he believed himself, but to which his friends really did not believe him to be, entitled. It is possible, however, that his moderate success rested rather with himself than with the extraneous events of his celebrated legal tournament with ourselves. But however this may be, shall others receive all commiseration, and shall no thought be given to poor LAMBERT, who was far more the victim of Mr. COOPER and the hospital surgeons in league with him, than ever was Mr. COOPER of THE LANCET and its writers?

How often has it been hinted that we have had the poisoned chalice returned back to our own lips? Cant and bigotry have assailed us with their worst, but we smile at such efforts. What we have dealt to others we are willing to accept for Mr. WEEDON COOKE and his operation for lithotomy. We ask no more for the Royal Free Hospital than that which we rendered to Guy's. As for Mr. THOMAS WAKLEY, we do not believe that any one of our most bitter enemies can say in his heart that he has not been treated most unjustly. We are content for him to be judged by his past and his future career. The profession will properly estimate the infamous attempts to stab him through the body of his colleague. But has Mr. WEEDON COOKE been treated as Mr. BRANSBY COOPER was? We published an account of Mr. COOPER's operation; it was declared to be incorrect, and we demanded that he should himself publish an account of it. It was upon this our quarrel arose. In Mr. WEEDON COOKE's case, the first threat is of an inquest, the first charge is one of manslaughter; and he is prevented by his legal advisers from publishing an account of his case, a thing which he would himself have desired. Mr. COOKE had no wish to blink publicity. We would ourselves have demanded of him a full account of the case, and it would have been given to the profession. Others might have commented as they pleased. He could, like Mr. COOPER, if he had so judged, have appealed to the law for protection. But we will not insult our readers by insisting upon the difference of the tribunal to which Mr. COOKE was subjected, as compared with the publication of his case in any journal, however hostile.

In the latter part of his life, Mr. COOPER harboured no unfriendly feelings towards the Editor of this journal or his family. He himself lived to see the value of publicity, and resorted to it in this very journal. As we observed last week, he in the most friendly manner supplied us with the materials for his biographical sketch, and sat for the portrait which appeared in our columns. But all this is beside the main question. Were we right or were we wrong in the great principle we contended for twenty-six years ago, and in the struggle for which Mr. COOPER got an unlucky hurt? Let the present condition of the Hospitals of St. Thomas and Guy testify. To that we appeal fearlessly. In every department they challenge publicity and investigation. There are no hospitals in London which furnish for the various medical publications a more copious abundance of valuable matter. For the last ten years our pages bear witness that none have been more laborious, nor more willing that their labours should be published, than the physicians and surgeons of these great hospitals. Guy's has, perhaps more emphatically than any other institution, recognised the utility of a periodical medical press. Only last year, the authorities advertised discontinuance of the admirable series of "Guy's Hospital Reports." One of the grounds put forward for this discontinuance was, that the reports of cases in the formerly dreaded LANCET were so excellent, that the local volume had become unnecessary. It must be remembered, to feel the force of this fact, that THE LANCET was the first journal to supply hospital reports, and that the battle of hospital reporting was more keenly waged, and contended for during a longer period, within the walls of Guy's, than in any other hospital in London.

We might find the justification of our policy in other quarters. Let the career of this journal for nearly the third of a century bear witness to its utility and to its power. It has been, as it will continue to be, a weekly history of progress made, of prejudice broken down, and of rights and privileges gained, not by any limited sections of the profession, but by the profession at large. "The greatest good to the greatest number," has been the motto of THE LANCET, gaining it who can. How many waves of opposition have broken against it, not only without inflicting injury, but rather with the effect of imparting vigour and strength? And this recent commotion, the late hubbub of unscrupulousness and spite, has it damaged THE LANCET? In the end, it is not we who shall complain. There are, we doubt not, many individuals who would gladly, if they could, wipe out all traces of their participation in the recent scandals. The story of their prejudice and folly, many as the dupes, and some as the duping, will, however, remain. But THE LANCET is still "the great fact" of the profession; and when all the froth and falsehood of the knaves and dunces who have feebly combined against it shall have blown to the winds, it will remain, strong in its hebdomadal life, not shorn of a single type, nor deprived of its ability to foster right, and denounce wrong to the best of the power and intellect of those to whom its management is entrusted.

WHENEVER an appalling catastrophe, marked by the sacrifice of human life, occurs, the public mind, as soon as it has recovered from the first shock of horror, turns, as it were by a natural law, to the idea of punishment; and that idea of punishment is too often dictated under the imperious dominion

of a feeling of vengeance. It is forgotten that vengeance is the attribute reserved by Almighty power: and well would it be for mankind if human presumption could abstain from usurping a function which it requires universal knowledge and divine mercy to exercise aright. But many see no further than this: they hear of a frightful deed of wholesale slaughter—as in the case of child-massacre at Escher—and instinctively and obstinately cry aloud for the blood of the perpetrator: six lives are not enough; another must be taken—blood for blood! And yet—setting aside the consideration of the question as to the justice and expediency, which many good and wise men doubt, of capital punishment—may it not be well to consider calmly, and remote from passion, whether the perpetrator of a deed, however transcending in atrocity, be justly an object for such a punishment? By our code of criminal law this question must be put. In short, the question, Whether the prisoner be sane or insane, responsible or irresponsible, a criminal or an object for medical treatment and restraint, must be put. Now, to whom is this momentous question put? Shall it be put to those who are ignorant of the nature of mental disease; or shall it be put to those who alone are competent to decide it? There is a maxim in law, seldom disregarded in any other case involving questions requiring special or professional knowledge for their solution,—“*Crede experto*,”—Trust to the skilled. It is true that, even in matters within their special province and practice, the skilled may err—judges as well as doctors differ—but still common sense adheres to the principle, and we prefer to yield our assent to the judgment of those who are the most likely to be right.

On the trial of ANN BROUGH for the murder of her six children, the question of the sanity of the prisoner was accordingly put to medical men skilled in the diagnosis and treatment of insanity. The decision of Dr. FORBES WINSLOW, Dr. BAMPFYLDE DANIELL, and Dr. DUESBURY was, that the unfortunate woman was insane. Some of our contemporaries have objected, with much emphasis, against the term “uncontrollable impulse,” attributed to Dr. WINSLOW. We are assured that Dr. WINSLOW never used the term. He described the case as one of “homicidal impulse.” The distinction is manifest and important. The gentlemen we have named were qualified, not only by their professional attainments, but also by their special knowledge of the facts of the case and their observation of the prisoner, to come to a correct conclusion. Their testimony was not impeached by that of any other qualified witness. No medical man was called to declare that in his opinion ANN BROUGH was sane, responsible, and criminal. More than this, one gentleman, well known as a medical jurist, Dr. ALFRED TAYLOR, whom it was intended to call for that purpose, and who was in court, after being in full possession of the case, came to the same conclusion as Dr. WINSLOW. Because Dr. TAYLOR could not support the prosecution by stating that the prisoner was of sound mind, he was not called. We will not upon this occasion pause to discuss that principle which appears to reign over our proceedings at criminal law, which assumes it to be just that the counsel for the Crown, who is presumed to be the counsel for absolute justice, should strain every nerve to obtain the condemnation of the prisoner, and should, in furtherance of that end, hold back evidence that might not only be useful to the prisoner, but actually subservient to the ends of justice. A plain understanding, not refined by the subtleties of the law, will with difficulty comprehend why, presuming the object of

the prosecution to be the discovery of truth, evidence eminently calculated to aid in that discovery should be suppressed. It is our opinion that ANN BROUGH was entitled to the evidence of Dr. TAYLOR, notwithstanding that he had been subpoenaed by the prosecution.

But we cannot now pursue our reflections upon this subject. That our readers and the more judicious portion of the public will concur in the opinion of Dr. FORBES WINSLOW and his colleagues, we entertain no doubt. Had ANN BROUGH been the possessor of wealth, had the question of her sanity been at issue before a Commission in Lunacy, proofs of mental aberration far less weighty than any that transpired at the late trial would have been held sufficient to deprive her of liberty and the enjoyment of her property. A close, and we believe an impartial, observation of the decisions in our Criminal Courts, and of Commissions in Lunacy, has brought us to this conviction,—that a standard of mental soundness is employed in testing the responsibility of a person charged with the commission of a crime, different from that which serves in testing the competency of a person to manage his affairs. Insanity that so overwhelms the reason and the affections, the moral and intellectual powers, as to drive a mother to the massacre of her children, is not so easily believed in, as is that insanity which is now equivocally expressed by incapacity in the conduct of business. Life and liberty are held cheap: property is guarded with the most assiduous jealousy.

ONE good result which, we have every reason to believe, will follow from the appointment of the new Board of Health, presided over by Sir BENJAMIN HALL, is, that the medical profession will be more fairly and fully represented and considered, both in the constitution of the Board itself, and in all its relations and dealings with the profession. We feel assured that the disposition to act justly towards us prevails generally amongst the officers composing the present Board; indeed, evidence of this disposition is afforded to some extent by the instructional Minute recently issued in relation to Cholera. Nothing can exceed the propriety of the tone and spirit in which all points relating to the medical management of that disease are considered.

It is obvious that in a Board of Health the medical element should not only be represented, but it should even predominate. A Board of Health acting without the sanction and authority of the medical faculty, the members of which are, by education and knowledge, in their own right, health officers, involves an anomaly and a contradiction. Nothing probably more powerfully contributed to the downfall of the late Board than the want of consideration evinced towards the medical profession, and the absence of agreement between the Board and profession in the views entertained. A remarkable instance of this will be remembered. During the prevalence of one of the recent outbreaks of Cholera, the Board advised almost complete abstinence from fruits and vegetables; the College of Physicians, on the other hand, gave advice almost the very reverse of this, and recommended the moderate use of well-cooked vegetables and ripe fruits, as being essential to the maintenance of the body in a state of health, and there is no doubt which advice was correct.

The time and thoughts of the Board of Health will no doubt be fully occupied for the present in carrying out the various measures which are required by the presence once more amongst

us of that dread scourge, Cholera; but this visitation passed away, we trust it will lose no time in entering upon the consideration of the important subject of the adulteration of articles of food and drink. If pure water be so necessary to health, and if when impure it forms so potent an agent in the production of disease, how great must be the effect on the health of the various articles of consumption, both solids and fluids, adulterated, as they so frequently are, in a hundred different ways, and this too often with the deadliest mineral poisons, as copper, arsenic, lead, and mercury? The late Board, we know, intended shortly to have taken up the subject of the adulteration of food, and we are satisfied that the present Board, by entering upon this question, would gain the well-deserved thanks of the country at large. The adoption of this suggestion would constitute a new feature in the proceedings of our own Boards of Health, but not in those of foreign countries, in which the necessity for securing pure and unadulterated food and drink has long been fully recognised and acted upon. We confidently believe that it would not be at all difficult to prevent, to a very great extent, the practice of adulteration now so prevalent, to the detriment of the public health, and to the scandal of the nation. That the subject of the adulteration of food should not sooner have engaged the attention of our Boards of Health is perhaps not so surprising, when it is considered that, until lately, the data did not exist by which the nature of the adulterations practised, and the extent to which they prevail, were made known. This information has now been supplied to a considerable extent, through the unceasing labours of the Analytical Sanitary Commission, published in this journal during the past four years. In connexion with these labours, we consider that the time has now arrived when the name of Dr. ARTHUR HASSALL should be mentioned, on whom these inquiries have almost exclusively devolved, and to whom belongs the credit of having brought to light practices in relation to the adulteration of food of the highest importance, and of the extent and nature of which no one previously entertained any adequate conception. It is almost impossible to over-estimate the importance of these labours, either in a pecuniary or sanitary point of view, both as regards the public and the medical profession. To Dr. HASSALL, then, we would say, belongs the merit of having established in this country a new and distinct department of public hygiene.

Of the new President of the Board of Health, Sir BENJAMIN HALL, we expect great and good things. Sir BENJAMIN is possessed of known ability, and has a thorough knowledge of business; moreover, although not wanting in firmness, he is of a conciliatory disposition. The present Board of Health, although doubtless a great improvement on the Board that preceded it, is not yet complete as regards its powers. By a singular and unaccountable omission, the metropolis is not included under its operation. This defect must surely have originated in some oversight, and should be remedied as soon as possible.

THE new regulations relative to the appointment of assistant-surgeons in the East India Company's service mark an era in the administration of public affairs. Under the India Bill of last year it was provided that the Medical Department should in future be supplied, not by men whose merit consisted in having influence with a director, but by men who could show the more unequivocal qualification of absolute fitness under the test of scientific competition. It will be well for

the public service generally, as well as for the credit of the Medical Department of the East India Company, when a similar principle shall be universally adopted. The direct and indirect advantages that would flow from such a course are incalculable. In the first place, it cannot be disputed that better public servants will be secured, and that being better men, and not owing their places to public patronage, they will be animated by a more independent spirit. In the second place, the indirect influence upon general morality and the advancement of education will be of the highest importance. Who has not witnessed, with pain and indignation, the contemptuous disregard of decency of many a young man, who, in firm reliance upon family interest, has felt himself at liberty to neglect the plain duty of striving to fit himself to discharge with credit the functions to which he was destined?

The Board of Commissioners have now issued their regulations for the admission of candidates at the first examination, to be held in January next, for the appointment of assistant-surgeons. Those candidates who can comply with certain preliminary requirements as to age and education are to be admitted to competition. We understand that a Board of Examiners has been formed to test the relative efficiency of the candidates in Surgery, Medicine, Anatomy and Physiology, and Natural History. It is stated that the persons who shall be pronounced the best-qualified in all respects, shall be appointed to fill the requisite number of appointments. There can be no doubt that no plan could be devised more likely to secure a body of medical officers of the highest character and attainments; but another condition is necessary, and that is, to make the service an object of honourable ambition to the class of men whom it is especially desired to attract. We submit it as a matter deserving the most serious consideration of the Board of Commissioners, whether they can reasonably expect that the *élite* of the medical students of the metropolis, men who have tried their prowess against their fellows, and who have learned in that trial the value of superior mental capacity and acquirements, will be eager to compete for admission into a service in which the officers are treated as men belonging to an inferior grade? We have recently shown, on the evidence of Dr. BURNES, late Physician-General at Bombay, that the Medical Service labours under disadvantages as to promotion, emoluments, retirements, and honours, which attach to no other department. Is it just or politic to treat almost the only class of men who are appointed, on the special ground of approved merit, as if they had less merit than everybody besides?

SINCE writing the above, we learn with regret the recent appointments to the Medical Examining Board of the East India Company. These appointments are certainly not such as to give satisfaction, either in this country or in India. We have not a word to say against Dr. PARKES, and Messrs. PAGER, BUSK, and HOOKER, although we believe the last of these gentlemen has never before been heard of in the profession, but we do say the selection of these gentlemen to the posts they are appointed to fill is an insult to the Indian Medical Service. With such men in this country as Mr. J. R. MARTIN, Dr. JAMES BIRD, and others, who have filled the highest professional offices in the different Presidencies, it is difficult to receive the selection which has been made, as a serious matter. It is understood that the appointments have been made, not by the Court of Directors, but by the Board of Control—in fact, by the

Government; and the whole matter must be considered as a job. The arrangements, as well as the men selected, challenge criticism. Why should there be two surgical examiners, and only one medical, while midwifery is entirely omitted, unless, indeed, this department is to be entrusted to Mr. HOOKER? We ought to mention that Dr. PARKES spent a short time in India, and has written a book on Cholera; but Messrs. PAGET, BUSK, and HOOKER, are entirely in a maiden state as regards military surgery and tropical pathology.

### PORTER, AND ITS ADULTERATIONS.

(Continued from page 110.)

HAVING given a very brief sketch of the manufacture of porter, we will next turn to the consideration of the subject of its adulteration.

Whatever may be the present practice with respect to the adulteration of beer, there is no question but that some years ago all kinds of malt liquor were extensively adulterated in a variety of ways, and this notwithstanding that Acts of Parliament have been passed for the special purpose of preventing such adulteration. Of this fact abundant evidence is to be obtained.

The author of a "Practical Treatise on Brewing," published some thirty-five years ago, and which passed through eleven editions, observes, after enumerating various ingredients employed for brewing porter, "That, however much they may surprise, however pernicious or disagreeable they may appear, he has always found them requisite in the brewing of porter, and he thinks they must invariably be used by those who wish to continue the taste, flavour, and appearance of the beer. And though several Acts of Parliament have been passed to prevent porter-brewers from using many of them, yet the author can affirm, from experience, he could never produce the present flavoured porter without them. The intoxicating qualities of porter are to be ascribed to the various drugs intermixed with it. It is evident some porter is more heady than others, and it arises from the greater or less quantity of stupifying ingredients. Malt, to produce intoxication, must be used in such large quantities as would very much diminish, if not totally exclude, the brewers' profit."

Another writer, Mr. Morris,\* describes and recommends a variety of articles to be employed in the brewing of beer and porter, as colouring, cocculus Indicus, sweet flag root, quassia, coriander seeds, capsicum, caraway seeds, grains of paradise, ginger, beans, oyster shells, and alum. "The colouring," Mr. Morris remarks, "gives a good face to the beer, and enables you to gratify the sight of your different customers." And again—"Beans tend to mellow malt liquor, and from their properties add much to its inebriating qualities; but they must not be used in too large a quantity. Oyster shells are very good to recover sour beer."

\* Child on Brewing Porter.  
† Morris on Brewing Malt Liquors.

"Alum is generally put into the vat, as it gives the beer a smack of age."

"Cocculus Indicus is used as a substitute for malt and hops, and is a great preservative of malt liquor. It prevents second fermentation in bottled beer, and consequently the bursting of the bottles in warm climates. Its effects are of an inebriating nature."

The author first quoted, Mr. Child, gives the following receipt for porter:—

1 quarter of malt.  
8 lbs. of hops.  
9 lbs. of treacle.  
8 lbs. of liquorice root.  
8 lbs. of essentia bina.  
8 lbs. of colour.  
Capsicum, half an ounce.  
Spanish liquorice, two ounces.  
Cocculus Indicus, a quarter of an ounce.  
Salt of tartar, two drachms.  
Heading.  
Ginger, three ounces.  
Lime, four ounces.  
Linseed, one ounce.  
Cinnamon, two drachms.

The essentia bina, he states, "is compounded of 8 lbs. of moist sugar, boiled in an iron vessel, for no copper one could withstand the heat sufficiently, till it comes to a thick, syrupy consistence, perfectly black and extremely bitter."

Colour "is composed of 8 lbs. of moist sugar, boiled until it obtains a middle state between bitter and sweet, and which gives to porter that mild, mellow colour usually so much admired."

The heading "is a mixture of half alum and half copperas, ground to a fine powder; and is so called from giving to porter the beautiful head of froth, which constitutes one of its peculiar properties, and which landlords are so anxious to raise to gratify their customers."

Mr. Morris gives the following receipts:—

#### Malt, 25 quarters.

	cwt.	qrs.	lbs.
Hops	1	2	0
Cocculus Indicus berry	0	0	6
Leghorn juice	0	0	30
Porter extract			

#### Malt, 20 quarters.

	cwt.	qrs.	lbs.
Hops	2	0	0
Cocculus Indicus berry	0	0	4
Sugar	0	0	28
Fabia amara (nux vomica)	0	0	6

And also the following directions:—

#### To make up a Vat of 150 Barrels.

"Use half a barrel of colouring, a quarter of a hundred-weight of cream of tartar, a quarter of a hundredweight of ground alum, one pound of salt of steel, and two barrels of strong finings. Mix these well together, and put them in a vat, rousing it thoroughly at the same time. Let the vat remain open three days, then close it and sand it over.

"In a fortnight it will be fit for use—your own good sense will inform you how to advantage."

The extensive employment of various drugs for porter-brewing led to the establishment, at about the period of the late French war, of a class of men termed "brewers' druggists." These persons issued regular price currents, and they made it their business to send travellers all over the country with lists and samples exhibiting the price and quality of the articles manufactured by them.

Mr. Accum\* states that "their trade spread far and wide, but it was amongst the country brewers chiefly that they found the most customers, and it is amongst them, up to the present day, as I am assured by some of these operators, on whose veracity I can rely, that the greatest quantities of unlawful ingredients are sold."

"It was at the same time, also," writes Mr. Accum, "that a Mr. Jackson, of notorious memory, fell upon the idea of brewing beer from various drugs without any malt and hops. This chemist did not turn brewer himself, but he struck out the more profitable trade of teaching his mystery to the brewers for a handsome fee. From that time forwards,

\* Treatise on Adulterations of Food, &c., p. 154.

written directions and receipt-books for using the chemical preparations to be substituted for malt and hops, were respectively sold; and many adepts soon afterwards appeared everywhere to instruct brewers in the nefarious practice first pointed out by Mr. Jackson."

The following remark, contained in Dr. Normandy's recent work, "Commercial Handbook of Chemical Analysis," would lead us to infer that the fraternity of brewers' druggists is not even yet extinct:—

"It is a publicly known fact, that carts may be seen bearing the inscription in staring paint, of 'C—, brewers' druggist.' Such a cart I have myself seen, a few days ago, standing in the broad daylight of midday, before a publican's shop or gin palace."

The Act of Parliament, 56 Geo. III., c. 52, prohibited chemists, grocers, and druggists from selling ingredients for adulteration to brewers under a heavy penalty. Amongst the prohibited articles specified are "any liquor called by the name of, or sold as colouring, from whatever material the same may be made; or any material or preparation other than unground brown malt for darkening the colour of worts or beer, or any liquor or preparation made use of for darkening the colour of worts or beer, or any molasses, honey, vitriol, quassia, cocculus Indicus, grains of paradise, Guinea pepper or opium, any extract or preparation of molasses, or any article or preparation to be used in worts or beer, for or as a substitute for malt and hops; and if any druggist shall offend in any of these particulars, such liquor, preparation, molasses, &c., shall be forfeited, and may be seized by any officer of Excise, and the person so offending shall for each offence forfeit £500."

By the same Act it is stipulated,—"That no brewer, or dealer, or retailer of beer shall receive or have in his possession, or make, or use, or mix with, or put into worts or beer, any liquor, extract, calx, or other material or preparation for the purpose of darkening the colour of worts or beer, or any liquor extract, calx, or other material or preparation other than brown malt, ground or unground, as commonly used in brewing; or shall receive or have in his possession, or use, or mix with, or put into any worts or beer, any molasses, honey, liquorice, vitriol, quassia, cocculus Indicus, grains of paradise, Guinea pepper or opium, or any article or preparation whatever, for or as a substitute for malt and hops, upon pain that all such articles and preparations as aforesaid, and also the said worts and beer shall be forfeited, together with the casks, vessels, and other packages, and may be seized by any officer of Excise; and such brewer of, dealer in, or retailer of beer so offending, shall for each offence forfeit £200."

In 1819, a committee of the House of Commons sat to examine into the price and quality of beer. In the evidence taken before this committee a variety of information is recorded respecting the adulteration of beer and porter as it prevailed at that time. A list is there given of twenty-nine *druggists* and *grocers* who were prosecuted and convicted, from the year 1812 to 1819, for supplying illegal ingredients to brewers for adulterating beer. Amongst the articles specified as thus supplied, are cocculus Indicus, molasses, and liquorice.

"At about the period of the late war, when the price of malt was very high, the London brewers," writes Accum, "discovered that a larger quantity of wort of a given strength could be obtained from pale than from brown malt. They therefore increased the quantity of the former, and diminished that of the latter. This produced beer of a paler colour, and of a less bitter flavour. To remedy these disadvantages they invented an artificial colouring substance, prepared by boiling brown sugar till it acquired a very dark-brown colour; a solution of this was employed to darken the colour of the beer. Some brewers made use of the infusion of malt instead of sugar colouring. To impart to the beer a bitter taste, the fraudulent brewer employed quassia-wood and wormwood as a substitute for hops.

"But as the colouring of beer by means of sugar, became in many instances a pretext for using illegal ingredients, the legislature, apprehensive of the mischief that might, and actually did result from it, passed an Act, in July, 1817, prohibiting the use of burnt sugar.

"No sooner had the beer-colouring Act been repealed, than other persons obtained a patent for effecting the purpose of imparting an artificial colour to porter, by means of brown malt, specifically prepared for that purpose only. The beer coloured by the new method is more likely to become spoiled than when coloured by the process formerly practised. The colouring malt does not contain any saccharine matter. The grain is, by mere torrefaction, converted into a gum-like substance, wholly soluble in water, which renders the beer more liable to pass into the acetous fermentation, than the common brown malt is capable of doing; because the latter, if prepared

from good barley, contains a portion of saccharine matter, of which the patent malt is destitute.

"But as brown malt is generally prepared from the worst kind of barley, and as the patent malt can only be made from good grain, it may become, on that account, an useful article to the brewer, (at least, it gives colour and body to the beer;) but it cannot materially economize the quantity of malt necessary to produce a good porter. Some brewers of eminence in this town have assured me, that the use of this mode of colouring beer is wholly unnecessary, and that porter of the requisite colour may be brewed better without it; hence this kind of malt is not used in their establishments."

The minutes of the Committee of the House of Commons already referred to, also contain a list of *publicans* prosecuted and convicted from 1815 to 1818, for adulterating beer with illegal ingredients, and for mixing table-beer with their strong beer. This list contains the names of nineteen publicans. The substances enumerated being, salt of steel, or sulphate of iron, common salt, molasses, and table-beer. The sulphate of iron, or salt of steel, is used to impart a fine frothy head to porter, considered to be one of the tests of good porter. To produce this property of frothing, the mixture called beer-heading was used, composed of green vitriol, alum, and salt. This addition, as we have seen by the previous list, was practised by the publicans. How far this mixture really possesses the property of imparting this heading to beer, is open to some question. In reference to beer-heading, Morris, in his treatise on "Malt Liquors" already referred to, makes the following observations:—

"On this part of our subject it may be necessary to observe that there are various modes of making it. Some make use of ground copperas and alum in about equal proportions; some resort to salt of steel, of which as much as will lie on a shilling is sufficient for a barrel of beer. But as the duties of a brew-house sufficiently employ every person engaged in it, I recommend it to be purchased of those who make it their business to have it ready prepared. Observe, that porter should not be sent out without it, as it causes the head so much admired in that liquor, and is agreeable to its flavour."

The committee of the House of Commons, more than once referred to, likewise published a list of *brewers* prosecuted and convicted from 1813 to 1819 for receiving and using illegal ingredients in their brewings. This list contains the names of thirty-four brewers. Amongst the ingredients enumerated are cocculus Indicus, hard multum, colouring, molasses, Spanish liquorice, honey, ginger, Guinea pepper, wormwood, coriander-seeds, hartshorn shavings, vitriol, and Guinea opium.

The following list contains the names of some of the illegal ingredients seized, from 1812 to 1818, at different breweries and brewers' druggists:—

<p><i>July, 1812—Mr. Nibbs.</i></p> <p>Multum ... 84 lbs. Cocculus Indicus ... 12 " Colouring ... 4 galls. Honey ... 180 lbs. Hartshorn shavings 14 " Spanish juice ... 46 " Orange powder ... 17 " Ginger ... 56 " Penalty, £300.</p> <p><i>June 13th, 1813—Mrs. Willis.</i></p> <p>Cocculus Indicus ... 1 lb. Spanish juice ... 12 " Hartshorn shavings 6 " Orange powder ... 1 " Penalty, £200.</p> <p><i>August 3rd—Mr. Whiffing.</i></p> <p>Grains of paradise 44 lbs. Quassia ... 10 " Liquorice ... 64 " Ginger ... 80 " Caraway seeds ... 40 " Orange powder ... 14 " Copperas ... 4 " Penalty, £200.</p> <p><i>December 14th—Mr. Abbott.</i></p> <p>Copperas, &amp;c. ... 14 lbs. Orange powder ... 2 " Penalty, £500, and Crown's costs. Proof of using drugs at various times.</p>	<p><i>February 15th, 1815.—Messrs. Mantell and Cook.</i></p> <p>Proof of mixing strong beer with table beer, and using colouring with other things. Compromised for £300.</p> <p><i>July 30th—Mr. Lyons.</i></p> <p>Capsicum ... 1 lb. Liquorice root powder 2 " Coriander seed ... 2 " Copperas ... 1 " Orange powder ... 8 " Spanish liquorice ... 4 " Beer colouring ... 24 galls.</p> <p><i>November 25th—Mrs. Hasler.</i></p> <p>Cocculus Indicus ... 12 lbs. Multum ... 26 " Grains of paradise 12 " Spanish juice ... 30 " Orange powder ... 3 " Penalty, £200.</p> <p><i>1817—From Mr. Stevenson, an old servant to Dunn and Waller, brewers' druggists.</i></p> <p>Cocculus Indicus extract ... 6 lbs. Multum ... 560 " Capsicum ... 88 "</p>

Penalty, £300 and costs, in-	
cluding mixing strong beer	
with table, and paying table-	
beer duty for strong beer, &c.	

Other practices had recourse to were, mixing strong beer with table beer, converting mild beer into old by adding sulphuric acid or oil of vitriol; and, on the other hand, of turning old beer into mild by the addition of carbonate of soda, potash, or oyster-shell powder. Mr. Child, in his treatise "On Brewing," directs, for the conversion of mild beer into old, the use of oil of vitriol.

Of the articles enumerated as being employed in the adulteration of beer and porter, many are nearly harmless; while others, as cocculus Indicus, copperas, opium, and strychnine, are highly deleterious.

It is interesting and important to notice, that no case of adulteration has ever been proved against any of our great London brewers.

We will next describe, very briefly, the method to be pursued in the analysis of porter.

One pint of the porter, either by measure or weight, as may be determined upon, should be first taken.

The specific gravity of this should be ascertained, and then its acidity, by means of a solution of dried carbonate of soda of known strength. The porter should next be submitted to distillation, using about 5000 grains. It is necessary that the acetic acid of the porter should be neutralized previous to distillation, otherwise it will pass over with the spirit, and so affect its quantity and specific gravity. It is also advisable that fully two-thirds of the liquid be distilled off, otherwise some of the spirit will remain behind. It is easy to convince oneself that this is really the case, either by distilling three separate pints of the same porter, taking off different quantities, or by removing the product of the distillation of the same sample at three different periods, when spirit will, in most cases, be found to be present in the last as well as in the first portion of liquid which comes over, although of course in greatly diminished amount.

Another portion of the porter, say 3500 grains, should next be taken, and the gum and sugar in this determined in the following manner:—

The gum, together with other matters, should be precipitated by subacetate of lead, the sugar remaining in solution. The fluid part, after subsidence, is to be separated from the solid, the sulphuret of lead being removed by filtration. This is best effected by decantation, and the addition to the precipitate of small quantities of distilled water. After separation, the lead is to be got rid of by means of sulphureted hydrogen. We have now obtained two clear liquids, the one holding chiefly gum in solution, and the other sugar. These are next carefully evaporated—the sugar over a water-bath, until it ceases to lose weight—the gum until it becomes nearly solid, when it should be treated with a little alcohol, and dried and weighed. Finally, both the sugar and the gum should be incinerated, and the ash deducted.

Another portion of the porter, equal to the above, should be evaporated to dryness, and the weight of the extract determined; this should afterwards be burnt, the ash weighed, and, if necessary, tested for salt and iron.

The several results thus obtained are then all to be calculated to the imperial gallon of 70,000 grains.

It is scarcely necessary to observe that the detection of many organic infusions sometimes employed in the adulteration of porter and beer is, in most cases, a matter of extreme difficulty, and in others it is altogether impossible in the present state of science.

One of the most injurious of the substances thus employed is the extract prepared from the seeds or berries of cocculus Indicus. Its detection in beer, and especially in porter, is attended with very great difficulty; and in many cases, when employed in small quantities, it cannot be discovered by any known means. M. Lassaigue has recently published the results of some experiments, instituted with the view of determining the presence in beer of picrotoxin, the active and poisonous principle of cocculus Indicus. He finds that this substance is not precipitated by subacetate of lead, which throws down most of the other colouring matters of beer, as well as the bitter principle of hops, and also that it is not absorbed by common bone charcoal thoroughly purified by

acids. By means of one or other of these substances, he succeeds in obtaining a tolerably pure solution of picric acid. M. Lassaigue states that while pure beer is almost entirely decolorized by either subacetate of lead or purified bone charcoal, beer adulterated with even the one twelve-thousandth or the one eighteen-thousandth part of picric acid, remains of a yellow citron colour. Supposing the beer to contain a still more minute quantity of picric acid, it must, subsequent to the use of one or other of the above substances, be evaporated until the yellow citron colour is produced. It is possible that by the above method picric acid might be detected in poor and pale beers, but we very much doubt whether it would be successful in the case of London stout and porter, which are not entirely decolorized by either subacetate of lead or purified charcoal.

The next and concluding portion of the Report will contain numerous Analyses of London Stout and Porter.

## MR. GUTHRIE'S DIRECTIONS TO ARMY SURGEONS.

(Extracted from his Pamphlet on the Hospital Brigade.)

1. WATER being of the utmost importance to wounded men, care should be taken, when before the enemy, not only that the barrels attached to the conveyance-carts are properly filled with good water, but that skins for holding water, or such other means as are commonly used in the country for carrying it, should be procured and duly filled.
2. Bandages or rollers, applied on the field of battle, are, in general, so many things wasted, as they become dirty and stiff, and are usually cut away and destroyed, without having been really useful; they are therefore not forthcoming when required, and would be of use.
3. Simple gun-shot wounds require nothing more, for the first two or three days, than the application of a piece of wet or oiled lint or linen, fastened on with a strip of sticking-plaster, or, if possible, kept constantly wet and cold with water. When cold disagrees, warm water should be substituted.
4. Wounds made by swords, sabres, or other sharp-cutting instruments, are to be treated principally by position. Thus, a cut down to the bone, across the thick part of the arm, immediately below the shoulder, is to be treated by raising the arm to or above a right angle with the body, in which position it is to be retained, however inconvenient it may be. Ligatures may be inserted, but through the skin only. If the throat be cut across in front, any great vessels should be tied, and the oozing stopped by a sponge. After a few hours, when the oozing is arrested, the sponge should be removed, and the head brought down towards the chest, and retained in that position without ligatures; if this is done too soon, the sufferer may possibly be suffocated by the infiltration of blood into the areolar tissue of the parts adjacent.
5. If the cavity of the chest is opened into by a sword or lance, it is of the utmost importance that the wound in the skin should be effectively closed, and this can only be done by sewing it up as a tailor or a lady would sew up a seam, skin only being included; a compress of list should be applied over the stitches, fastened on by sticking-plaster. The patient is then to be placed on the wounded side, that the lung may fall down, if it can, upon, or apply itself to the wounded part, and adhere to it, by which happy and hoped-for accident life will in all probability be preserved. If the lung should be seen protruding in the wound, it should not be returned beyond the level of the ribs, but be covered over by the external parts.
6. It is advisable to encourage previously the discharge of blood from the cavity of the chest, if any have fallen into it; but if the bleeding from within should continue, so as to place the life of the sufferer in danger, the external wound should be closed, and events awaited, according to those principles which are more fully detailed in the Commentaries.\*
7. When it is doubtful whether the bleeding proceeds from the cavity of the chest, or from the intercostal artery (a surgical bugbear), an incision through the skin and the external intercostal muscle will expose the artery close to the edge of the rib having the internal intercostal muscle behind it. The vessel thus exposed may be tied, or the end pinched by the forceps, until it ceases to bleed. Tying a string round the rib is a destructive piece of cruelty, and the plugs, &c., formerly recommended, may be considered as surgical incongruities.
8. A gun-shot wound in the chest cannot close by adhesion, and must remain open. The position of the sufferer should

\* A copy of the Commentaries is placed in box No. 7, in Store-waggons A, B, C.

therefore be that which is most comfortable to him. A small hole penetrating the cavity is more dangerous than a large one. and the wound is less dangerous if the ball goes through the body. The wounds should be examined, and enlarged if necessary, in order to remove all extraneous substances, even if they should be seen to stick on the surface of the lung; the opening should be covered with soft oiled or wet lint—a bandage when agreeable. The ear of the surgeon and the stethoscope are invaluable aids, and ought always to be in use; indeed, no injury of the chest can be scientifically treated without them.

9. Incised and gun-shot wounds of the abdomen are to be treated in nearly a similar manner; the position in both being that which is most agreeable to the patient, the parts being relaxed. The Commentaries to be attentively studied with reference to these injuries, and particularly when the intestines are wounded.

11. In wounds of the bladder, an elastic catheter is generally necessary. If it cannot be passed, an opening should be made in the perineum for the evacuation of the urine, with as little delay as possible. (See Commentaries.)

12. In gun-shot fractures of the skull, the loose broken pieces of bone, and all extraneous substances, are to be removed as soon as possible, and depressed fractures of bone are to be raised. A deep cut, made by a heavy sword through the bone into the brain, generally causes a considerable depression of the inner table of the bone, whilst the outer may appear to be merely divided.

13. An arm is rarely to be amputated, except from the effects of a cannon-shot. The head of the bone is to be sawn off, if necessary. The elbow-joint is to be cut out, if destroyed, and the sufferer, in either case, may have a very useful arm.

14. In a case of gun-shot fracture of the upper arm, in which the bone is much splintered, incisions are to be made, for the removal of all the broken pieces which it is feasible to take away. The elbow is to be supported. The forearm is to be treated in a similar manner; the splints used should be solid.

15. The hand is never to be amputated, unless all or nearly all its parts are destroyed. Different bones of it and of the wrist are to be removed when irrecoverably injured, with or without the metacarpal bones and fingers or the thumb; but a thumb and one finger should always be preserved when possible.

16. The head of the thigh bone should be sawn off when broken by a musket-ball. Amputation at the hip-joint should only be done when the fracture extends some distance into the shaft, or the limb is destroyed by cannon-shot.

17. The knee-joint should be cut out when irrecoverably injured; but the limb is not to be amputated until it cannot be avoided.

18. A gun-shot fracture of the middle of the thigh, attended by great splintering, is a case for amputation. In less difficult cases, the splinters should be removed by incisions, particularly when they can be made on the upper and outer side of the thigh. The limb should be placed on a straight, firm splint. A broken thigh does not admit of much, and sometimes of no extension, without an unadvisable increase of suffering. An inch or two of shortening in the thigh does not so materially interfere with progression, as to make the sufferer regret having escaped amputation.

19. A leg injured below the knee should rarely be amputated in the first instance, unless from the effects of a cannon-shot. The splinters of bone are all to be immediately removed, by saw or forceps, after due incisions. The limb should be placed in iron splints, and hung on a permanent frame, as affording the greatest comfort, and probable chance of ultimate success.

The apparatus (Mr. Luke's) for the treatment of fractures of the leg by suspension, consists of a cradle, a leg rest or support, two splints, and a folding board. The cradle is formed of two iron arches, held together by a straight rod, the ends of which pass through their centres and fix by binding screws. Each arch is formed of two parts, for the convenience of packing.

The leg rest consists of two sliding parts, and a foot-piece, allowing of movement on either side when in use, both being fixed by a binding screw.

The folding board gives the cradle a permanent support, and is absolutely necessary for the comfort as well as the safety of the sufferer.

Each splint is formed of two parts, which slide on each other, and may be fixed at the required length by a binding screw.

In using the apparatus, the back of the leg and lower end of the thigh are to be evenly supported on a pad placed on the leg rest, and a splint is to be placed on each side of the leg, and the whole secured by straps carried around near the knee and ankle. The leg is then to be suspended by two straps from the bar of the cradle placed over the leg as represented, so as to swing without touching the folding board on which the cradle is placed. The foot should be secured to the foot-piece by a bandage.

Solid splints, and a firmly fixed cradle, under which the leg may hang, may be said to be the *sine qua non* of the treatment of a gun-shot fracture of the leg. The conveyance carts carry forty-six sets, with pads and slings complete.

20. An ankle-joint is to be cut out, unless the tendons around are too much injured, and so are the tarsal and metatarsal bones and toes. Incisions have hitherto been too little employed in the early treatment of these injuries of the foot for the removal of extraneous substances.

21. A wound of the principal artery of the thigh, in addition to a gun-shot fracture, renders immediate amputation necessary. In no other part of the body is amputation to be done in the first instance for such injury. Ligatures are to be placed on the wounded artery, one above, the other below the wound, and events awaited.

22. The occurrence of mortification in any of these cases will be known by the change of colour in the skin. It will rarely occur in the upper extremity, but will frequently do so in the lower. When about to take place, the colour of the skin

of the foot changes, from the natural flesh colour to a tallowy or mottled white. Amputation should be performed immediately above the fractured part. The mortification is yet local.

23. When this discoloration has not been observed, and the part shrinks, or gangrene has set in with more marked appearances, but yet seems to have stopped at the ankle, delay is, perhaps, admissible, but if it should again spread, or its cessation be doubtful, amputation should take place forthwith, although under less favourable circumstances. The mortification is becoming, or has become, constitutional.

24. Bleeding, to the loss of life, is not a common occurrence in gun-shot wounds, although many do bleed considerably, seldom, however, requiring the application of a tourniquet as a matter of necessity, although frequently as one of precaution.

25. When the great artery of the thigh is wounded, (not torn across,) the bone being *uninjured*, the sufferer will probably bleed to death, unless aid be afforded, by making compression above, and on the bleeding part. A long, but not broad stone, tied sharply on with a handkerchief, will often suffice until assistance can be obtained, when both ends of the divided or wounded artery are to be secured by ligatures.

26. The upper end of the great artery of the thigh bleeds scarlet blood, the lower end dark venous-coloured blood; and this is not departed from in a case of accidental injury, unless there have been previous disease in the limb. A knowledge of this fact or circumstance, which continues for several days, will prevent a mistake at the moment of injury, and at a subsequent period, if secondary hæmorrhage should occur. In the *upper* extremity both ends of the principal artery bleed scarlet blood, from the free collateral circulation, and from the anastomoses in the hand.

27. From this cause, mortification rarely takes place after a wound of the principal artery of the arm, or even of the arm-pit. It frequently follows a wound of the principal artery in the upper, middle, and even lower parts of the thigh, rendering amputation necessary.

28. It is a great question, when the bone is *uninjured*, where, and at what part, the amputation should be performed. Mortification of the foot and leg, from such a wound, is disposed to stop a little below the knee, if it should not destroy the sufferer; and the operation, if done in the first instance, as soon as the tallowy or mottled appearance of the foot is observed, should be done at that part; the wound of the artery, and the operation for securing the vessel above and below the wound, being left unheeded. By this proceeding, when successful, the knee-joint is saved, whilst an amputation above the middle of the thigh is always very doubtful in its result.

29. When mortification has taken place from any cause, and has been arrested below the knee, and the dead parts show some sign of separation, it is usual to amputate above the knee. By not doing it, but by gradually separating and removing the dead parts, under the use of disinfecting medicaments and fresh air, a good stump may be ultimately made, the knee-joint and life being preserved, which latter is frequently lost after amputation under such circumstances.

30. Hospital gangrene, when it unfortunately occurs, should be considered to be contagious and infectious, and is to be treated locally by destructive remedies, such as nitric acid, which is supplied for the purpose in case No. 5, and the bivouacing or encamping of the remainder of the wounded, if it can be effected, or their removal to the open air.

31. Poultices have been very often applied in gun-shot wounds, from laziness, or to cover neglect, and should be used as seldom as possible.

32. Chloroform may be administered in all cases of amputation of the upper extremity and below the knee, and in all minor operations; which cases may also be deferred, without disadvantage, until the more serious operations are performed.

33. Amputation at the upper and middle parts of the thigh are to be done as soon as possible after the receipt of the injury. The administration of chloroform in them, when there is much prostration, is doubtful, and must be attended to, and observed with great care. The question whether it should or should not be administered in such cases being undecided.

34. If the young surgeon should not feel quite equal to the ready performance of the various operations recommended, many of them requiring great anatomical knowledge and manual dexterity, (and it is not to be expected that he should,) he should avail himself of every opportunity which may offer of perfecting his knowledge.

The surgery of the British army should be at the height of the surgery of the metropolis; and the medical officers of that service should recollect, that the elevation at which it has arrived has been off many points principally due to the labours of their predecessors, during the war in the Peninsula. It is expected, then, that they will not only correct any errors into which their predecessors may have fallen, but excel them by the additions their opportunities will permit them to make in the improvement of the great art and science of surgery.

A deputation of the Medical Society of London, consisting of Mr. Headland, President; Dr. Tyler Smith and Mr. I. B. Brown, Vice-Presidents; Mr. Hancock, Treasurer; Dr. Smiles, Chairman of Council; Mr. Stedman; Mr. A. Harrison, Librarian; and Dr. E. Smith and Mr. C. H. R. Harrison, Hon. Secretaries, had an interview with Sir William Molesworth, on Saturday last, at the Office of Works and Public Buildings in Whitehall-place.

## Correspondence.

"Audi alteram partem."

### POST-MORTEM APPEARANCES IN CHOLERA.

To the Editor of THE LANCET.

SIR,—In the year 1832, meeting Sir Astley Cooper in consultation, I inquired if he had seen any cases of cholera? No, he replied, but that he had seen several *interiors*. His description of the post-mortem appearances so exactly tallied with those recorded by Dr. Robinson, of Newcastle, in the last number of your valuable periodical, that the specific character of the disease, after an interval of twenty-two years, remains precisely the same. The two points upon which Sir Astley Cooper remarked were, the inflammatory condition of the stomach and intestines, and the distention of the gall-bladder; and these are the prominent appearances recorded by Dr. Robinson, and which have presented themselves in almost all the cases of cholera which have been examined. As the only successful practice is based upon correct pathology, I at once determined to treat the disease according to the post-mortem appearances. In each successive irruption of cholera, this rule of practice has been my guide, and the success which has attended it has encouraged me to persevere.

Of the nature of the poison which causes this morbid condition of the alimentary canal and distention of the gall-bladder, we are as ignorant as we are of the nature of certain ophidian poisons, which cause pneumonia, or destroy the coagulating quality of the blood; but the indications for the cure of cholera are clearly—

First, to empty the distended gall-bladder; and secondly, to allay the inflammatory condition of the stomach and bowels.

To fulfil the first indication, the salt emetic is the safest and most effectual. If this be followed by calomel and rhubarb, copious bilious evacuations will be procured, and with them all the dangerous symptoms of the disease will subside. To empty the gall-bladder is essential to the patient's recovery; for if reaction be established without this emptying of the gall-bladder, bilious fever sets in, and proves as fatal as the cholera itself in the stage of collapse.

The second indication—to allay the inflammatory condition of the bowels, and also to assist in evacuating the contents of the gall-bladder—is fulfilled by the saline treatment prescribed by Dr. Stevens, assisted by the calomel and rhubarb.

In this unwonted disease there are two strong instinctive desires on the part of the patient—the one is for cold water, and the other is for salt, or more properly for the saline powders. Therefore the desires of the patient may be safely gratified, and cold (iced) water allowed *ad libitum*. If the view I have taken of this dreadful disease be correct, it is obvious that all endeavours to promote reaction by means of *stimulants*, and to stop the natural efforts to unload the gall-bladder by means of *astringents*, must be worse than useless; they must inevitably tend to seal the fate of the patient, by locking up within him the *casus morbi*.

The same principle should guide us in the treatment of the premonitory diarrhoea, which is cholera undergoing a natural cure. In innumerable cases, a small dose of calomel and rhubarb, followed by castor oil, by carrying off the redundant secretion of bile, arrests the diarrhoea at once; whereas if it be stopped by astringents and sedatives, a simple disease becomes complicated, and a bilious diarrhoea exchanged for a bilious fever of a grave character.

I remain, Sir, yours, &c.,

ISAAC PIDDUCK, M.D.

August, 1854.

### EXAMINATIONS AT THE UNIVERSITY OF LONDON.

To the Editor of THE LANCET.

SIR,—Perhaps there is nothing of which a man is more tenacious than the reputation of his Alma Mater, and he would oftener shut his eyes to any little discrepancy in her conduct rather than bring it to light, and thus subject her to censure, however merited it might be; but if she palpably errs, methinks it is a kindness to expose her errors, in order that they may be rectified before her fame becomes sullied.

I was one of the 240 candidates who presented themselves for matriculation at the University of London, and one of the 150 who passed in the first division. On proceeding to pay my examination fee, I found the offices of the University of London consisted of a *two-pair back* in an out-building of

Marlborough House. The pass-examination was held at King's College, in five or six different rooms, each room being presided over by some unknown—certainly not the examiners, who never appeared. A few days after the pass-list was published, I presented myself at the appointed time at King's College, with the intention of "going in" for honours. On inquiring in which room the examination was held, I was informed, "No examination was held there, and I had better try Marlborough House." On reaching the *two-pair back*, I found no one in attendance but a little urchin, something between a printer's devil and an errand-boy, and half-a-dozen students in the same quondary as myself. After pacing round the courtyard for half an hour, an official conducted us to the examination-room, still more classic ground than the *two-pair back*—namely, "The Thatched House Tavern"!

It is, I believe, an almost indisputable fact, that the examinations of the University of London are of a character eminently calculated to raise the status of the profession: I, for my part, would sooner attach to my name M.D. Lond. than all the rest of the English and Scotch medical degrees put together. As the Marquis of Lansdowne well remarked in the House recently, "The University of London has now undeniably proved itself entitled to the approval of the public by the very excellent way it has educated those men who have resorted to it." But the arrangements and appointments, as they at present remain, would utterly disgrace a charity school. I would ask, Where is the University of London? It is not for me to suggest where it should be; but with such an influential body as the senate at its head, I should imagine a more dignified place might be found for the dispatch of business than a *two-pair back*, and a more appropriate spot for examination than *The Thatched House Tavern*.

I am, Sir, faithfully yours,

AN UNDERGRADUATE IN HONOURS OF THE  
UNIVERSITY OF LONDON.

August, 1854.

## THE CHOLERA.

VARIOUS, contradictory, and often violent as have been the arguments and discussions carried on relative to the mode of propagation and pathology of cholera, the battle-ground has been still more hotly contested in respect to its *therapeutics*. As the organ representing the scientific and practical progress of medicine, our pages have necessarily been the medium from time to time of expressing the particular opinions and practice of a great body of the profession of this country and of our Indian possessions, and the result has been, of course, that we have helped to make known the most opposed doctrines, each often most positively maintained, sometimes, we regret to say it, upon grounds, too, which rather should have authorised the utmost amount of diffidence. To go through the list of "advised methods of procedure," "best modes of treatment," "safest plans," &c. &c., to say nothing of the *specifics* recommended, would be to pass in review a very fair share of all the more effective agents of the Pharmacopœia. Even then many things would be left unnoticed, such as transfusion into the veins, hot-air baths, the "cold sheet," and other appliances, which are not to be found printed in the College list. Should the reader be curious, however, upon these points, if he will refer to our second volume for the year 1853, page 416, "he will find something to his advantage." Out of the many plans of treatment which have been advised, there are two which have had more extensive trials perhaps than any other; these are the "saline plan" of Dr. Stevens, and the "small doses of calomel frequently repeated" of Dr. Ayre, of Hull.\* Both these plans have been largely and extensively put in force, and, according to the evidence of the witnesses, both with the utmost benefit, and with the most complete utility. Between these contradictory verdicts, it was necessary for certain authorities on particular occasions to strike a *mean*, which should direct the current value to be allotted to the methods under consideration. In 1849, learning that the College of Physicians had appointed a "commission" on cholera, Dr. Stevens requested one or two interviews with the President, after having had a few with the "Central Board of Health," to inquire as to the opinion held of, and make some further suggestions about, the "saline plan" of treat-

ment. The result of his inquiries and suggestions, (according to his own account,) in connexion with the former, may be gleaned from the following extract from Dr. Stevens' book\* (reviewed by us in a former number, vol. ii. 1853, p. 58):—

"The learned president advanced towards me, &c. . . . 'I am very sorry,' he said, 'very sorry indeed, sir, that you have again intruded yourself on me. I am very busy, too busy indeed, to have my time—my precious time—was ed in any idle discussion about either the cholera or your saline treatment.'" (xxvii. p. *op. cit.*)

Dr. Stevens' application to the Central Board having also been "a complete failure, (xxxiii. *op. cit.*) in 1853 appeared the voluminous "Observations," contravening what had been said against the success of the "saline plan," asserting that the investigation made as to its results was a "sham inquiry," and maintaining it was "eminently successful" in practice.

Since the appearance of Dr. Stevens' reclamation, the College of Physicians have published their last Report, (reviewed in our first volume for 1854, page 250,) and in connexion the "saline plan." It is stated—"We have no evidence that they [salines] possessed any influence over the local morbid action in the mucous membrane. It was not until this surface had in part recovered its function of absorption that any good resulted from their employment."—(page 196, second part.) This same Report of the College has, however, called up another and more temperate reclamer—viz., Dr. Ayre, the great advocate of the "calomel treatment" previously alluded to. The report says—"In general no appreciable effects followed the administration of calomel, even after a large amount in small and frequently-repeated doses had been administered. For the most part it was quickly evacuated by vomiting or purging, or when retained for a longer period, was afterwards passed from the bowels unchanged. Salivation but very rarely occurred, and then only in the milder cases. We conclude that calomel was inert when administered in collapse; that the cases of recovery following its employment at this period were due to the natural course of the disease, as they did not surpass the ordinary average obtained when the treatment consisted in the use of cold water only."—(page 177, second part.)

In Dr. Ayre's tract† (the contents of which first appeared in THE LANCET) now before us, the main points sought to be inculcated, are the following:—

1st.—That the inquiry of the "College Committee" into the treatment of cholera has been badly conducted, and the character of the evidence adduced by it is defective.—(page 28.)

2nd.—That Dr. Gull represents not merely the writer of the Committee's Report, (second part,) but was himself the *committee* on the subject of the treatment, and is alone responsible for all that is contained in it.—(page 57.)

3rd.—That while "calomel is indeed *not* remedial in cholera when given in large doses, or in small ones at wide intervals, when administered in small doses, according to prescribed conditions, and without any other adjuvant than cold water *ad libitum*, it exhibits a remedial power well nigh approaching to that of a specific; so that in very truth the cases which Dr. Gull has brought forward in support of his views, tell so strongly against the conclusion which he aims to establish, that I have only to avail myself of them as arguments to prove the truth of the position, that calomel, when rightly given, is truly a remedy in this disease."

Between the College Report and Dr. Ayre we attempt no reconciliation, leaving this for the present in the hands of the reporter of the second portion of the committee's labours, Dr. Gull. From the same evidence, or rather the same sources of the evidence used by both parties, different conclusions have been arrived at. Some great error, therefore, must somewhere exist, and we cannot say that we think it beneath the dignity of the College committee to reply, through its reporter, to the reclamation of the physician of Hull. In the meantime, it may not be out of place if we indicate once more the exact method of procedure recommended by Dr. Ayre. It "consists, during the stage of collapse, in giving one or two grains of calomel every five or ten minutes, with one or two drops of laudanum with the first few doses of the drug, and in perseveringly continuing the same dose at the same intervals of time, until the symptoms of collapse become materially subdued. . . . I have never given stimulants in any form, because I found them not to be necessary, and believed they would prove pernicious when, from the long duration of the collapse, and the delay in commencing the treatment, consecutive fever might be feared;

\* Observations on the Nature and the Treatment of the Asiatic Cholera. By William Stevens, M.D., D.C.L. Oxon, &c. &c.

† A Letter to the President and Fellows of the Royal College of Physicians, in relation to the Evidence cited in their late Report on the Treatment of Epidemic Cholera. By Joseph Ayre, M.D., &c. &c. London. 1854. pp. 71.

and lastly, I fixed no other limit to the quantity of calomel which I gave than that which the duration of the collapse prescribed, having become early assured that pending its continuance no absorption of the calomel into the system takes place; that whilst it is given no salivation or other inconvenience is induced by it."—(p. 4.)

Relative to the progress of cholera in the metropolis, we have condensed the following from the last "Weekly Return" of the Registrar-General (Aug. 12th):—

Districts.	Population (1851).	Deaths from Cholera.
Western (Kensington, &c.) ...	376,427	68
Northern (Marylebone, &c.) ...	490,396	39
Central (St. Giles, &c.) .....	393,256	31
Eastern (Shoreditch, &c.) .....	485,522	60
Southern (St. Saviour's, &c.) ...	616,635	446
Lambeth, &c.)		644

Of this number, 208 were under fifteen years of age, 347 between fifteen and sixty, and 89 above sixty.

The deaths from diarrhoea numbered 195.

The progress of the present epidemic, which slightly manifested itself in the second week in July, is shown by the following numbers:—Deaths from cholera, 5, 26, 133, 399, and 644; deaths from diarrhoea and dysentery, (also in the last five weeks,) 51, 63, 87, 146, and 200. Of last week's deaths from cholera, 446, as is shown above, occurred on the south side of the river, a proportion to the total number of 69 per cent.

We select the following memoranda from the previous "Weekly Return" of the Registrar-General, as offering points of special interest:—

"In *Unit's* hospital-ship, on 26th July, a convict aged thirty years, 'cholera (six hours).' (*Inquest.*) The registrar remarks, 'It appears the deceased drank a large quantity of cold water when heated. The convicts on board the hospital-ship, I believe, drink the water of the river Thames, and this is sufficient of itself to predispose every man on board to an attack of cholera, as it is well known that the river is defiled with every kind of impurity.'—*Borough-road*: At 2, Union-street, on 27th of July, the widow of a master shoemaker, aged seventy-three years, 'diarrhoea, (seven days,) cholera Asiatica (eight hours).' It is stated on medical certificate that 'this patient had been suffering from a severe diarrhoea for seven days without receiving medical advice.'—At 23, Cambridge-terrace, Clapham-road, on 30th July, the daughter of a commercial traveller, aged twenty years, 'choleraic diarrhoea, (twenty-four hours,) debility of constitution, increased by the too active operation of a black draught.'—At 4, Queen-street, on 31st July, late a brewer's servant, aged seventy-six years, 'cholera (one day).' Dr. F. E. Jones appends the following note:—'This man was taken ill at eight o'clock in the morning, and when I saw him at seven o'clock in the evening, he was in a state of collapse. The treatment was 'fifteen drops of diluted sulphuric acid, and two grains of calomel every fifteen minutes.'—At 6, Strand, on 2nd August, a commercial-traveller, aged thirty-seven years, 'diarrhoea, (four days,) cholera, (ten hours.)' The registrar adds:—'The diarrhoea was neglected, and visits to Crystal Palace, &c., made. Brandy and water was the remedy taken, and a rapid termination was the consequence.'—At the workhouse, Islington, on 2nd August, a female domestic servant, aged thirty-three years, 'cholera, collapse.' Mr. Watts remarks:—'This is the first case of cholera which has occurred in this district this year, and the particulars and treatment are given from the physician's notes. The deceased was brought in a cab from her home, Trinity-street, Islington, to the workhouse, labouring under vomiting and diarrhoea; was seen and prescribed for by the house-physician; when on the following day at noon collapse came on, warm applications were administered, both externally and internally, and at evening the extremities obtained warmth, and the pulse was moderately good; a large turpentine embrocation was placed over the abdomen, brandy, beef-tea, and medicinal stimulants continued during the night, but as morning approached she was found to be in a helpless state of collapse, and died in the afternoon of the third day.'"

In spite of the remonstrances which have been made, no less than seventy-three interments have taken place at St. James's Church, Bermondsey, since Monday last, the greater number consisting of deaths from cholera. What notice has been taken of the representation of this nuisance by the Secretary of State? During the raging of this pestilence the rector of the

mother church, (according to a correspondent in the *Daily News*), who monopolises all the fees, has been refreshing himself at New Brighton, and the parish clerk of St. James's may be seen almost daily inhaling the breeze at Ramsgate, while the incumbent of St. James's is doing the whole of the duties. The effluvia arising from re-opened graves is now beyond endurance, and the only redress to be got from the functionaries of the church is, "There is no room, we have no alternative."

Lord Jocelyn died on Saturday last, after a few hours' illness, of the prevailing malady; and a vacancy at the Post-office has occurred through the sudden death, by cholera, of Mr. J. P. Godby, the chief clerk to Mr. Rowland Hill.

The Postmaster-General has appointed Dr. Gavin to be Medical-Superintendent of the General Post-office during the prevalence of the cholera. The health of the officers of the department is therefore closely watched, and a supply of medicines being kept at the chief office in St. Martin's-le-Grand, and at the principal branch offices, immediate relief can be given in cases of illness.

We may also record the death of Mr. A. Cooke, one of the principal performers at Astley's Theatre, and brother of the proprietor, who died of cholera on Monday morning, having been seized with the premonitory symptoms on Sunday while in a railway train midway between Margate and London.

To the above list must also be added the death of J. E. Winterbottom, M.B., (Oxon.) the scientific traveller, who was seized at Rhodes with cholera, and died after a short illness. Dr. Winterbottom was possessed of a varied and extended acquaintance with the science of zoology and botany.

A few days ago Mr. Langham held an inquest at the Westminster Hospital, on the body of Mr. G. Allen, aged 32, architect and surveyor, in extensive practice at St. Ives, Huntingdonshire, who, while passing Kennington-cross, was suddenly attacked with cramps and other symptoms of Asiatic cholera. Mr. Newcome, apothecary at the hospital, stated that the deceased was seized with a most severe attack of cholera. It was one of the worst forms, and Mr. Allen died about eleven o'clock the same night.

At some inquests lately held in Milbank Penitentiary, it was stated in the evidence of the authorities that there were 1123 prisoners in the gaol, of whom 129 were in the infirmary. There had been 35 cases of cholera, and at present there were 22 under treatment. The Government had handed over barracks at Dorchester for the reception of the prisoners, and 600 would be removed there next week. Spirits were daily served out to the prisoners. From further accounts we learn that the first division of prisoners, who are at present in good health, to the number of 300, were on Monday conveyed in a number of omnibuses to the Great Western Railway, where a special train was in readiness to convey them to Dorchester Gaol, (to be followed by other divisions as soon as they can possibly be got away.) The above measures were considerably accelerated by the fact of three more deaths having occurred on Saturday last, one on Sunday morning, and the fifth while the jury were sitting upon the bodies of the other four on Monday afternoon. At first it was thought that the Thames water, which had hitherto been used, was the principal source of the disease, but the river supply had been abandoned, and the prison was now served with water from the artesian wells which supply the fountains at Charing-cross, and yet there was no diminution whatever of the disease. It was stated during the inquest that when the wind blew from the direction of the bone factory at Lambeth and the adjoining gas works, the smell was intolerable, and the sickness was sure to increase throughout the whole prison.

In reference to the above, Mr. Penryn Aston has thus addressed the public:—I observe the mournful accounts of the cholera in the Milbank Prison, such as commenced in 1849, and it will always be so when cholera comes, unless the prison is better ventilated. The place is built in a bog, walled up itself into a well. All this could be greatly alleviated by very freely piercing the walls at their bases to let the air in. The building itself might be served in the same way, and immediately the greatest benefits would be felt by the inmates. This I proposed years ago to a minister, and expect it was considered ridiculous, as regarding the safety of the prisoners. But the thing could be done with safety to their persons, and great benefit to their health.

As precautions against cholera on the river, her Majesty's old 42 gun-frigate *Bacchante* has been sent from Chatham to the Thames, for the reception of patients, the *Dartmouth* being found unfit for that purpose.

On Saturday last two fatal cases of cholera occurred in the London Hospital. One case was that of a nurse employed in the institution, who died after a few hours. The second patient was a

female who was brought in a cab, but she died notwithstanding all that could be done by the medical staff of the establishment. The increase in the duties of the officers has been so great, that additional medical men have been supplied to wait upon the out-door cases of choleraic diarrhoea, and 300 have been prescribed for during the last three days. A ward has been fitted up in the hospital expressly for cholera, by order of the directors, and a great number of bad cases have been admitted. The principal portion of the applicants have been men employed on the river and in the docks.

More than six gallons of chalk-mixture, with catechu, &c., have been dispensed in a single day at a dispensary in Southwark.

In consequence of the disease having broken out in an overcrowded lodging-house in Shadwell, the board of guardians of the Stepney union have appointed a sanitary committee, who sit every morning at Ratcliffe workhouse, near Stepney church, and a dispensary has been opened in York-square, which is in the centre of the union, where there are two persons to dispense medicine night and day, to all applicants in the district. Cholera mixtures have also been sent by the board to the police-station in King David-lane, Shadwell, where the poor are supplied at all hours by the officers on duty, in cases of emergency.

During the past week, several fatal cases of cholera have occurred at Greenwich. The epidemic has made its appearance in those localities where it formerly prevailed, and where absence of drainage, water, and pure air, present predisposing causes of disease and death.

The *Essex Herald* says: We regret to state that this malignant scourge has visited Essex with all its untamed virulence. On Friday week it first made itself apparent in Epping union-house, and since that time no fewer than sixteen inmates have died, and five of them since Friday night. In Romford union-house, too, the disease has made its appearance, six cases having occurred there last week; and deaths have taken place at Dagenham and Ilford.

The accounts from Trimdon are not so favourable as they were a short time ago. The *Sunderland News* states that there have been eleven deaths during the past week. The pit-houses have been converted into a temporary hospital, and the assistance of an eminent practitioner from London has been secured.

Cholera has made considerable progress, both in Glasgow and neighbouring parishes. On the south side of the river, also, where the cases used to be few in number and far between, there has been a marked increase, and the disease has been extremely rapid with its victims. The Glasgow returns of cholera cases are rather irregular, but it would appear that during the first three days of this week there were at least 101 cases, and thirty-six deaths.

Somewhat strongly-marked and rapidly-fatal cases of cholera have, within the last eight days, appeared at Hamilton. The patients have in every case neglected the premonitory symptoms, and medical aid was only called in when collapse had begun.

The progress of cholera in Belfast is thus noticed in the *Belfast Mercury*:—"We are sorry to observe that the last weekly return presents a considerable increase in the number of cholera patients. There were in the dispensary districts for the week ending Tuesday last:—New cases, 53; died, 12; discharged cured, 18; sent to hospital, 21; remaining under treatment, 9. There have been since the first appearance of the disease:—Total number of cases, 310; died, 82; cured, 92; sent to hospital, 129. We are glad to learn that no further cases have occurred in the barracks since the death of private William Frazer."

## THE WAR.

### HEALTH OF OUR ARMY AT ALEDYN.

(FROM OUR SPECIAL CORRESPONDENT.)

CAMP, NEAR ALEDYN.

SINCE I last wrote we have changed our encampment, being obliged to do so on account of sickness. We have marched about four miles from Aledyn, still about ten miles from Varna, which we can now see, and are enabled to enjoy the sea breeze, as there is no hill to intercept it. I trust this will be an advantage; we are now situated on a small plain on the top of a hill, having woods on the slopes on the south side, though not so much as at Aledyn, neither is the country so pretty, but I hope it is more healthy. The reason of our sudden change was the amount of sick in the hospitals, each having a great number of cases of diarrhoea, and within this last week cholera has broken out, and carried several men off in a few hours. I think

about six cases have occurred, four of them of the last draft that came out, men who had only arrived a few days. The Guards have left a good many sick at Aledyn, who will come on when able, most of them not very urgent cases, though unable to stand the jolting of the slow ox-drawn waggons over these rocky roads. The Highlanders seem to suffer by far the least, have the fewest men here in hospital, and I have not heard of any deaths, though I believe they live hard and drink a good deal of the country wine, which is very bad; perhaps their kilts, from their coolness, may preserve them to a certain degree. I have no doubt the Highlanders are a more hardy race, and accustomed to greater work and fatigue; they all still remain at Aledyn. The cases of cholera occurred nearly together, and after two deaths the Duke determined to move if any more died. Tuesday evening, late, orders came, and on Wednesday morning, at nine, we marched. I believe this fearful scourge has broken out in the fleet, and many deaths have occurred.

For the next two months we expect a good deal of sickness, though, strange to say, as yet, except amongst the Highlanders, no cases of intermittent fever have occurred. They have had a few cases, I hear,—all have had cases, of slight fever; but there have only been, as far as I can learn, three or four of a typhoid nature amongst the Heavy Division, none as yet fatal; very likely the fevers are to come.

The temperature in the tent here now is 96°, but we have a nice breeze now and then. Both the other divisions are suffering greatly—much more than this division; they are losing fifteen a day. One day the Light Division lost sixteen; and the day before yesterday, the 2nd, so I was told by one of our officers who was over there yesterday, lost nineteen. I cannot say how true it is, as I am unable to ride over there now on account of duty. One of the regiments has lost its quartermaster, but as yet none of the officers.

The French are still worse off. Report says they have lost an immense number, and are now much broken down both in health and spirits. They who came out in such excitement to enter the field and fight immediately, now they find that very likely it will not be so this year, and that fatal disease is amongst them, are greatly disheartened. Our men are in very much better spirits than can be imagined; and a good brush with the Russians would show that John Bull can stand a great deal, and after all be victorious. Our French allies would soon be all right if they had the same treat by our sides, and would soon discomfit the foe. The French general is against going to the Crimea. I expect we shall do nothing this year, except perhaps have a fight for winter quarters; and as soon as possible in the spring, and all in good health, I hope gain additional laurels. All seem to bear this with great patience, and as soldiers, from officers to men. Of course, a grumble is heard occasionally, but rarely; and, as you may expect, we are not in a land flowing with milk and honey. Not a luxury, even butter we cannot get, except very sour, and a very little of that.

I think I have told you all, and must draw to a close, so as to catch the post.

P.S. Since I have written, the Highlanders have come up, and bring bad news from Aledyn; some of the sick left behind and the attendants are suffering from cholera, and some, it is feared, are sinking.

### CHOLERA AMONGST THE TROOPS AT DEVNA.

(FROM OUR SPECIAL CORRESPONDENT.)

ON Saturday night, cases of a very fatal character appeared amongst the regiments of the Light Division encamped at Devna. During the afternoon of the same day the wind, which had been blowing from the north and north-west, veered round to the south-east, so as to blow directly over from the Devna swamp upon the camp. Towards night the breeze stopped, and was followed by a still, oppressive atmosphere, at the same time that there was considerable electric disturbance around, as evidenced by frequent flashes of sheet-lightening. No thunder or rain accompanied this, and clouds were few and distant. Although the camp had occupied the same ground since June the 30th, and the close congregation of so many horses and men in a limited space must be of course taken into consideration, and though some were inclined to attribute the outbreak to imprudence on the part of the men in eating unripe fruit, there are many reasons to suppose that the change in the direction of the wind, and the concurrent importation of malaria from the marsh, were the first and direct causes. The regiments of the cavalry encamped on the east side of the plain were out of the line of direction of wind, being protected by the high hills in their rear; while the regiments of the line on

the west aspect of the plain, and nearest to the swamp, being exposed to its influence, alone suffered. No cases occurred amongst the cavalry. Of the seven regiments of the Light Division, two only altogether escaped, the 77th and Rifle Brigade, and these were encamped most remote of the whole line from the swamp. Beyond these again, nearer to the village of Devna, was a battery of Horse Artillery, and no cases occurred amongst the men of this corps.

At the recommendation of the medical officers, the Light Division quitted Devna early on Monday morning, and marched to Monestue, about five miles' distance on the road toward Paravadi. One brigade is now occupying a rising ground on one side of a deep dell; the other brigade has encamped at a short distance beyond, and on the opposite side. A small village is placed in the hollow between the two brigades. This appears at first sight to be a very healthy position. The land around is generally cultivated; there seems to be abundance of good water and wood, and no traces of any marsh are visible.

Between the occurrence of the first case of cholera, on Saturday night, and the time of the division quitting Devna, early on Monday morning, twenty-one deaths occurred in the five regiments attacked. Several cases from each regiment were left behind, some of which would beyond all doubt prove fatal.

It has been remarked, that in this division, and in this division only, a peculiar arrangement of the tents has been enforced, which by many has been supposed to be anything but salubrious. They are pitched in double rows, one company's tents being back to back with the next company's tents. The evil of this is, that a thorough ventilation of the air is prevented between the tents, while it requires the most constant attention to prevent the accumulation of bones, damp, and other noxious matters, amongst the cords, and in the narrow passage between the two rows. It must be remembered, that in every two tents thus placed so closely together, twenty-eight, and sometimes thirty, men have to sleep. In the division lying next to the Light Division, (General Evans's,) the advantage of single lines of tents, with a clear wide space between them, in a sanitary point of view, is at once apparent. On the first arrival of the Light Division at Devna, the tents of one of the brigades were pitched in single rows; but to the no little annoyance of the men, fatigued by their march from Aledyn, an order was given for them to be struck again, and re-pitched in a double arrangement. What military advantages are obtained by this plan of encampment, I know not; in a medical point of view, it is certainly objectionable. Another practice considered objectionable has been the general construction, by men and officers, of temporary bowers, to escape from the oppressive heat of the tents during the daytime. The interruption to the circulation of air, the decaying leaves, and the escape from sight of many objectionable matters which may be concealed amongst them, have been the alleged objections to their use. They have been found a very advantageous addition to the crowded hospital marquee in the field, due attention being paid to their cleanliness. The shade afforded by them, at the same time that the air was able to pass freely through the branches of which they were made, were obviously useful, especially to convalescents; while the relief to the marquee thus obtained was manifestly beneficial to the more active cases under treatment.

It is notoriously difficult to persuade persons who have not paid much attention to the subject of sanitary laws that, in certain conditions of the atmosphere—the choleraic for example—attention to minutest details is often of most serious importance. Unless a noxious effluvia forces attention by its effect on some of the senses, the existence of the evil is not credited by such persons. The necessity for dilution of a poison by abundance of free, pure air, where no such poison is obvious to sight or smell, cannot be perceived; neither can be duly understood the influences exerted at such a season by crowding of persons, by impediments to the normal action of the respiratory and other systems of the animal economy from peculiarities of dress, by certain qualities of diet, and other really important agencies. These difficulties are experienced in military as in civil life, and medical officers are not unfrequently neglected or considered over-officious in consequence. It is to be hoped the day may come when a general knowledge of sanitary laws will form part of the education of every commander to whom may be entrusted the lives, comfort, and management of bodies of men, for so the co-operation of the military and medical officers will be rendered much more serviceable and efficient.

July 28th.—A marked improvement in health and spirits has taken place since the arrival of the troops at this encampment. A few isolated cases of cholera have occurred, but in the majority of instances the seeds of the disease appear to

have been imbibed before leaving Devna. A large proportion of the cases which were left behind at Devna, too ill to be removed with the troops, have since proved fatal; the total number of deaths in the division being now one officer and nearly fifty men. Two women have died. Cases of cholera have also occurred amongst the troops at Aledyn and Varna. From the crowded and usually neglected state of this latter town, from the nearness of the lake with its adjoining swamp, an epidemic is not unlikely to exert considerable influence there. By timely removal of the troops to more healthy localities, by improved diet, and constant attention to sanitary arrangements, we trust to be spared much mortality should the disease continue amongst us. General Sir de Lacy Evans's division, whose camp has been most removed by its lofty and sheltered position from the influence of the Devna lake and marshes, and in all respects most favourably situated, has continued by far the most healthy of the British force in Turkey.

The following general order has been issued by Lord Raglan:—

"Bowel complaints being prevalent, as is usual at this season of the year, and the officers of the medical department being of opinion that some improvement of the ration might be beneficial, the Commander of the Forces has been pleased to authorize, as a temporary measure, that two ounces of rice or Scotch barley be issued daily to each man, without addition to the stoppage, upon the distinct understanding that the allowance shall cease at the end of September, or whenever it may be considered no longer necessary."

In consequence of the increase in the number of cases of fever and bowel complaints in the Light Division of the British force in Turkey, an order has been issued to shift the camp from Devna. Several fatal cases of cholera have occurred.

## Medical News.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, August 10th, 1854.*

BOND, CHARLES, Lutterworth.  
CUFF, MICHAEL HENRY PAUL, Bath.  
DYKES, GEORGE SAMUEL, Wakefield.  
GLOVER, JAMES GREY, South Shields.  
HARRIES, CHARLES ALEXANDER, Bath.  
HOPWOOD, EDWIN JAMES.  
LEFFS, THOMAS BUSBY, Oxfordshire.  
POWELL, JOSIAH TAYLOR.  
SPARKE, GEORGE WHITEFIELD.  
WATTS, GEORGE HENRY, Thatcham, Newbury.  
WICKHAM, CHARLES THOMAS, Winchester.  
WOODWARD, THOMAS HEWLETT, Port Natal.

**APOTHECARIES' HALL, DUBLIN.**—ANNUAL ELECTION OF OFFICERS.—At a meeting of the General Council of the Apothecaries' Company of Dublin, held, pursuant to Act of Parliament, upon the 1st of August, 1854, the following gentlemen were duly elected to serve as officers for the ensuing year:—Governor, George B. Owens, M.D.; Deputy-Governor, William Madden, M.D., Sen.; Court of Examiners, O. W. Barker, M.D., T.C.D.; J. Betty, M.D.; E. H. Bolland, M.D.; T. Collins, M.R.C.S.E.; C. Holmes, M.D.; W. Madden, M.D., Jun.; J. M'Munn, M.D.; W. D. Moore, A.B., T.C.D.; R. Muloch, M.D.; H. P. Nolan, M.D.; — O'Flaherty, L.R.C.S.I.; J. Shea, M.D.; Secretary, Charles Henry Leet, M.D.

**ELECTIONS.**—Dr. Alderson has been elected Treasurer of the College of Physicians.—Dr. Parkes, Mr. Pagett, Mr. Busk, and Mr. Hooker, have been elected Examiners of Medical Candidates for the East India Company's Service.—Mr. Sympton has been unanimously elected one of the Surgeons to the Lincoln County Hospital.—On July 29th, J. W. Godwin, M.D., Cantab., was elected Physician to the Norfolk and Norwich Hospital, in the room of Dr. Hull, resigned.

**A CURIOUS FACT.**—The *Englishman*, in a review of the "Annals of Medical Science," mentions the curious fact that an outbreak of the "Mahamurree," or plague of Kumaon, is invariably preceded by a mortality amongst the rats. It would seem that the filth and effluvia which are the causes of this terrible disease are too powerful even for these animals. They can live in a London sewer,—they perish in a Kumaon cottage.

DR. O'SHAUGHNESSY, we are sorry to say, talks of vacating his post of superintendent of electric telegraphs in this country. Ill health, through over exertion, is said to be the cause.—*Englishman*.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, AUGUST 12TH.**—Last week the total number of deaths registered in London was 1832, whilst the births numbered 1662, the return exhibiting the unusual result of an excess in the former over the latter. In the ten corresponding weeks of the years 1844-53, the average number of deaths was 1110, which, if raised in proportion to increase of population, becomes 1221. Hence it appears that the actual number of deaths in last week exceeds the estimated amount by 611.

This excess corresponds nearly with the number of fatal cases of cholera recorded last week, which was 644, while those of diarrhoea numbered 195. In the thirty-second week of 1849, which ended August 11th, 823 deaths occurred from cholera and 173 from diarrhoea. The progress of the present epidemic, which slightly manifested itself in the second week of July, is shown by the following weekly numbers: deaths from cholera, 5, 28, 133, 399, and 644; deaths from diarrhoea and dysentery (also in the last five weeks), 51, 63, 87, 146, and 200.

### Obituary.

In Paris, W. HILL, M.D., aged thirty-two, son of the late Thomas Hill, Esq., of Ballybagh, Limerick.

At Hatton End, Mr. JOHN GIBSON, F.R.C.S., aged forty-nine, deeply regretted by a large circle of friends.

At Westbourne-terrace, Mr. CLAUDE CAIRNE, late Physician-General at Madras.

At Morley, Yorkshire, Mr. JOHN GIBBURN, F.R.C.S., aged eighty-one.

At 26, Bedford-street, Covent-Garden, Mr. SAMUEL ROGERS, Surgeon, aged ninety-two, formerly of Hendon and Kilburn, Middlesex.

At Westgate, Bradford, Mr. JONATHAN AKROYD ILLINGWORTH, Surgeon, and Justice of the Peace for the Borough.

We regret to announce the death of Surgeon MALCOLMSON, of the 3rd Bombay Light Cavalry, which occurred at Nusseerabad, on the evening of the 16th of July, of pneumonia. Dr. Malcolmson entered the service in 1828, and was, when he died, in expectation of seeing himself nominated to succeed Dr. Collier as staff-surgeon of the Rajpootana field force. By this casualty Assistant-surgeon T. W. Ward will be promoted.

The following is a list of the number of deaths amongst the surgeons of the Bombay army during the last eighteen months:

Surgeon ELLIOT, died at Mandivi.  
Surgeon RYAN, died in England.  
Surgeon NICHOLSON, died in Scinde.  
Surgeon GREY, died in Bombay.  
Surgeon WATKINS, died in Bombay.  
Surgeon GILLANDERS, died in Guzerat.  
Surgeon BARINGTON, died in Bombay.

### The BRITISH MEDICAL DIRECTORY for 1855.

ALL duly-qualified Medical Practitioners are respectfully requested to forward, as soon as possible, their "ENTRIES" or "RETURNS" for this Annual Volume. References to the Entries in the Directory for the current year, (1854,) stating that they are correct, will be sufficient. When alterations are required, they should be distinctly specified, and in all cases the names of the writers should be written clearly, and at full length.

Address to the Editors at the "BRITISH MEDICAL DIRECTORY" Office, 423, Strand.

### TO CORRESPONDENTS.

**Hydromathy.**—We believe that, at the time of the late lamented Lord Jocelyn's death, he was under hydropathic treatment. Lord Jocelyn married the daughter of Lady Palmerston, and died at Lord Palmerston's house in Carlton-gardens. He was also a brother-in-law to Lord Shaftesbury. Both Lord Palmerston and Lord Shaftesbury have been largely concerned in measures relating to sanitary reform.

**M.D. Lond.**—The Bill for conferring on the medical graduates of the University of London equal privileges with those enjoyed by the graduates of Oxford and Cambridge, received the Royal assent on the 12th instant. The Bill, though drawn up by the graduates' committee, and carried mainly through the skill and energy of Professor Foster, was cordially supported by the Senate. Lord Montagu took charge of the Bill in the House of Lords; and the Chancellor, the Earl of Burlington, came up from Westmoreland, at great inconvenience, to vote at the division on the second reading.

**A Reader.**—THE LANCET was the first to propose a GOVERNMENT CHOLERA COMMISSIONER. Several most important leading articles appeared at the time the cholera was raging at Newcastle-upon-Tyne. We then and now assert that is utterly disgraceful on the part of the Government not to have ordered such an inquiry into the cause of this frightful pestilence. The public have not objected to subscribe an enormous sum of money to defray the expenses of the Eastern war, and we feel certain they would not hesitate to subscribe for the employment of a Cholera Commission.

**M.D.**—It is currently rumoured that it is to a medical baronet, long connected with the Court, the profession owe the job that has been perpetrated in the formation of the Medical Examining Board for India. If an independent medical press could be sufficiently bullied by its enemies, such jobs might escape with impunity.

**A Candidate.**—The regulations are printed in the form of an advertisement in this day's LANCET.

**A. B. C.** (Glasgow).—It appears to us that the charges were perfectly reasonable, and that the committee acted most unjustly to their medical officer.

**A Constant Reader** (Woolwich) must be good enough to authenticate his communication, in confidence.

**F. B.**—Application might be made to Dr. Hall, shipping agent, Minorics.

**N.**—Full information on the subject will appear in the Students' Number of THE LANCET.

Mr. Taylor's (Old Kent-road) article is in the hands of the printer.

### PRESENTATION OF DR. RADFORD.

To the Editor of THE LANCET.

SIR,—In your account of the presentation by Dr. Radford of his museum and library, in the last number of THE LANCET, there is a slight error in the name of the hospital which has been favoured, as, instead of the Birmingham one, which appears in your paper, it is the Manchester Lying-in Hospital, with which institution Dr. Radford has been connected for a great number of years. Apologizing for thus troubling you,

Believe me, yours, &c.,

MEDICUS.

Manchester, August, 1854.

**Mr. G. Southam.**—The list of scholarships, prizes, &c., will be inserted next week.

**Scrutator** has neglected to authenticate his communication. The practices to which he refers are not creditable, but we cannot notice them on anonymous authority.

**M.E.C.S.—1.** It is probable that in any Reform Bill which may be brought forward by Government the present anomaly will be removed.—**2.** Next session.

**An Old Subscriber.**—It occurred in the practice of the late Mr. Liston, and was recorded in THE LANCET, vol. II. 1837, p. 38.

**M.D.**—The possession of a diploma from a foreign university does not confer the power of practising in this country. It is true that the laws which should regulate the College of Physicians have become all but a dead letter; but M.D. would, nevertheless, be practising illegally.

**Thetis** (Birmingham).—The Bill for the better administration of the laws relating to the public health is printed. Its clauses chiefly refer to the powers granted to the Board, and the remuneration of its officers.

**Epillon.**—For many years Sir A. Cooper lectured on Surgery at St. Thomas's Hospital.

**A Young Surgeon.**—Apply at the office of the Board of Health, Richmond-terrace. The gentleman mentioned has no power.

**Enquirer.**—We believe the town named was free from the disease at the time. The authorities promote cleanliness in every possible way.

**A Reformer.**—The Act does not extend so far.

**A Student.**—Certificates of attendance on a course of Ophthalmic Surgery are required.

**Miles.**—Sir G. Ballingall, in Edinburgh, and Dr. James Bird, in London, lecture on Military Surgery.

**Mr. T. S.**—The Medical Society commences its meetings for the session on the third Saturday in October.

**Rectus.**—Dr. Alderson is the new treasurer.

**COMMUNICATIONS, LETTERS, &c.,** have been received from—Dr. Bainbridge; Mr. J. W. Wakem; Mr. Taylor; Medicus (Manchester); Mr. Symeon; Mr. Winterbottom; Mr. Wolff (Independence, Missouri); Pater Familias (Manchester); Mr. Jackson; A Military Surgeon; Argus (Paris); Mr. Emerson; Mr. Hall; Mr. R. Little (Lifford, with enclosure); Mr. J. E. Osmer; Mr. R. Milner (Salford, with enclosure); Mr. J. Lonsdale (Newchurch, with enclosure); Dr. Williams; An Undergraduate; Scrutator (Chorley); Fair Play; Mr. Jas. Burn (Manchester); Dr. J. Pidduck; Mr. Hart; Mr. James; Mr. Buxton; Mr. T. E. Clarke (East India House); Mr. W. Sedgwick; A Constant Reader; Mr. F. Bayes (Heacham); F. B.; M.D. Lond.; A Candidate; A. B. C. (Glasgow); N.; M.E.C.S.; An Old Subscriber; M.D.; Thetis (Birmingham); Epillon; A Young Surgeon; Miles; A Reader; Enquirer; A Reformer; A Student; Mr. T. S.; Rectus; Mr. Mapletin; Mr. Clark; A Reader of THE LANCET for Thirty Years; An Hospital Surgeon; &c. &c.

**Oleum Jecoris Aselli.****DR. DE JONGH'S LIGHT-BROWN  
COD-LIVER OIL.**

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES,  
NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS.  
*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout,  
Chronic Rheumatism, and all Scrofulous Diseases.*

Approved of and recommended by BERZELIUS, LIEBIG,  
WOHLER, JONATHAN PEREIRA, FOUQUIER, and numerous  
other eminent medical men and scientific chemists in Europe.

Specially rewarded with Medals by the Governments of  
Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the  
Continent, in consequence of its proved superior power and  
efficacy—effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the  
elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the pale oils made in  
England and Newfoundland, deprived mainly of these by their  
mode of preparation.

A pamphlet by DR. DE JONGH, with detailed remarks upon  
its superiority, directions for use, cases in which it has been  
prescribed with the greatest success, and testimonials, forwarded  
gratis on application.

*The following are selected from some of the leading Medical  
and Scientific Testimonials in favour of Dr. de Jongh's  
Cod-liver Oil.*

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest  
thanks for your attention in forwarding me your work on the  
chemical composition and properties, as well as on the medicinal  
effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your  
researches, and your efforts to provide sufferers with this  
Medicine in its purest and most genuine state must ensure you  
the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the  
highest regard and esteem, yours sincerely,

(Signed)

"Dr. JUSTUS LIEBIG.

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia  
Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I  
had the pleasure of seeing you in London, that you were  
interested commercially in Cod-liver Oil. It was fitting that  
the author of the best analysis and investigations into the  
properties of this Oil should himself be the Purveyor of this  
important medicine.

"I feel, however, some diffidence in venturing to fulfil your  
request by giving you my opinion of the quality of the Oil of  
which you gave me a sample, because I know that no one can  
be better, and few so well, acquainted with the physical and  
chemical properties of this medicine as yourself, whom I regard  
as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of  
responding to your application. The oil which you gave me  
was of the very finest quality, whether considered with refer-  
ence to its colour, flavour, or chemical properties; and I am  
satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my  
dear Sir, to be very faithfully yours,

(Signed)

"JONATHAN PEREIRA.

"Finsbury-square, London, April 18, 1851.

"To Dr. de Jongh."

Sold Wholesale and Retail, in bottles, labelled with Dr.  
de Jongh's stamp and signature, by ANSAR, HARFORD,  
and Co., 77, STRAND, Sole Consignees and Agents for the  
United Kingdom and British Possessions; and by all respect-  
able Chemists and vendors of Medicine in Town and Country,  
at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d.

**IMPERIAL MEASURE.**

**Drug Price Currents forwarded free**

of Postage, on application, by Messrs. HEWLETT and GODDARD,  
Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near  
London Bridge, removed from Hatton-garden; containing the ready Cash  
Prices for Drugs and Pharmaceutical Preparations of the purest quality,  
Messrs. H. and G. solicit the attention of the Medical Profession resident in  
the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantage  
attendant upon the above Price Current.

**Pure Coco-Oleine, as prepared by**

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for  
Consumption, Brompton. It has no unpleasant smell or taste, and is sold at  
about half the price of Cod-liver Oil, for which it often proves an efficient  
substitute. It may now be had in sealed quart and pint bottles, from all  
retail chemists and druggists, and wholesale from the principal wholesale  
druggists, and from Price's Patent Candle Company, Belmont, Vauxhall,  
London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

**W. Twinberrow begs to draw the**

attention of the Medical Profession to his EXTRACT of INDIAN  
HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties  
being so beneficial where opiates are inadmissible; also to his MEDICINAL  
EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium  
Maculatum, Atropin, Belladonna, Cytisus Umbellatus, &c.) also to his Liq.  
Taraxac, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariae (diuretic),  
and Liq. Belas (prepared from the Egie Mameloe, or Indian Beal), for Dy-  
sentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edwards-street, Portman-square.

**Cotyledon Umbilicus. — Epilepsy**

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS,  
(vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations  
specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipissated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's Liquor, or Fluid Extract, prepared by Spontaneous  
Insipissation, possesses every characteristic of the Fresh Juice, and has proved  
highly efficacious where the ordinary Extracts have proved inert. Dose, a  
liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge,  
33, Great Russell-street, Bloomsbury.

**JOZEAU'S COPAHINE MEGE.**

Or SACCHARATED CAPSULES, approved of by the French College of  
Physicians, successfully administered in the Paris and London Hospitals, and  
acknowledged by them to be the best remedy for the cure of certain diseases.  
(See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 6d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 40, Hay-  
market, London, whose name is printed on the Government stamp; and all  
the principal Chemists.

**Water Filter for the Pocket, with**

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity  
of Water. Size, 4 inches by 2. Price 3s. 6d.

J. SOLOMON, Wholesale Optician, and Photographie Dépôt, 23, Red Lion-  
square.

**Mineral Waters.—W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received  
a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS  
of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg,  
Kissingen, Vichy, Seidlitz, Pulma, Ems, Seltzer, Fachingen, &c., at his Eau-  
de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22, Henrietta-  
street, Cavendish-square.—N.B. Balls and evening parties supplied with  
German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

**Blake's Aerated Citrate of Potash**

WATER.—BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, have  
recently prepared an Aerated Solution of Citrate of Potash, which they beg  
to introduce to those members of the profession who may desire it for the  
use of their patients. It will be found a valuable auxiliary in the treatment  
of Gout and Rheumatic Affections, as well as the Lithic acid Diathesis and  
Dyspepsia. Their Potash Water, as usual, contains 18 grains of the Bicar-  
bonate in each bottle; Soda, 16 grains; Magnesia, 12 grains; and Ammonia,  
10 grains. Seltzer, Vichy, and other foreign waters, from the respective  
analyses.

**By Her Majesty's Royal Letters**

PATENT.—T. MAYO, WATSON, and Co., 2, BERNERS-STREET,  
OXFORD-STREET, LONDON, Manufacturers of Mineral Aerated Water,  
and Patentees of the Syphon Vase and Valvular Stopped Bottle. The ob-  
jection so generally made to the common soda-water bottle, in the inconven-  
ience attending its being opened, has induced Messrs. T. Mayo, Watson, and  
Co., in addition to the Syphon Vase to introduce the VALVULAR STOP-  
PED BOTTLE, whereby the annoyance complained of is removed, the use  
of both corks and wire being dispensed with, and the advantages arising to  
those who are in the habit of drinking aerated waters (more especially ladies  
and invalids) greatly enhanced, from the circumstance that any quantity, how-  
ever small, can be withdrawn, whilst, at the same time, the portion remaining  
in the bottle retains its gaseous properties unimpaired.—Applications having  
been made to them for agencies for the sale of the Syphon Vase and Valvular  
Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrange-  
ments accordingly, and will be happy to treat with parties desirous of becom-  
ing agents.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons.  
Recommended by BARON LIEBIG.  
Address, HARRINGTON PARKER and CO., 5½, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**  
per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per  
dozen quarts; delivered free within four miles. Merchants supplied with  
Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 18, Clement's-lane, City.

**Good Cyder, a Preventative of**  
Cholera. (See THE LANCET, 15th of July, p. 33.)

This refreshing and wholesome beverage may be obtained PURE, and in the  
highest perfection, of WRIGHT and COOKMAN, Devonshire-wharf, Bankside,  
London, whose stocks are warranted the produce of the finest orchards in the  
best cyder districts of Devon, and made only from the choicest picked fruit.

A three dozen hamper of their celebrated pale Champagne Cyder, delivered to  
any railway station in London, for 3s. shillings.

Wine Merchants and Victuallers supplied on liberal terms.

**Allsopp's Pale Ale.—Medical gentle-**  
men who recommend this ale as an article of diet to their patients are  
respectfully requested to inform them at the same time, that they may rely on  
procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or  
bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer  
merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constitu-  
tents of pure water, and not any other ingredient, organic or inorganic, as  
per analysis of Professor Thomas Graham, F.R.S., University College,  
London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal Col-  
lege of Chemistry, and of the Analytical Sanitary Commission, published in  
THE LANCET, Saturday, May 15, 1863, No. 20, Vol. 1st, upon ALLSOPP & SONS,  
EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHA-  
NIEL EASTTY, 132, Upper Thames-street, London.

**Soyer's Aromatic Mustard.—"M.**  
Soyer has just brought out a New Mustard, which possesses a most  
beautiful bouquet; and which is entirely free from adulteration."—THE  
LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**  
PRESERVING HEALTH.—The Sanitary Commission instituted by  
THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place,  
Oxford-street, to be "entirely free from deleterious admixture," the attention  
of the public is directed to EDMONDS and CO.'S HOMEOPATHIC  
COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**  
superior Barley Water in Fifteen Minutes, has not only obtained the  
Patronage of Her Majesty and the Royal Family, but has become of general  
use to every class of the community, and is acknowledged to stand unrivalled  
as an eminently pure, nutritious, and light Food for Infants, Children, and  
Invalids; much approved for making a delicious Custard Pudding, and excel-  
lent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed  
for making a superior Gruel in Fifteen Minutes,—light for supper,—and alter-  
nately with the Patent Barley is an excellent Food for Children and Invalids,  
being particularly recommended by the Faculty as the purest and best Prepa-  
ration of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors  
to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country  
in Packets of 6d., and 1s., and in Family Cansisters at 2s., 5s., and 10s. each.

**Do you bruise your Oats yet?—New**  
Oat-crushers, £2 15s., £4 5s.; Chaff-cutters, £1 7s., £3 7s.; Mangles,  
£2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—  
One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

**Carriages.—Three good single-seated**  
Broughams, and one light double Brougham, suitable for a Medical  
Man, from 30 to 40 guineas. A new, light, and handsome Barouche,  
and double-seated Brougham, for one, or a pair of light horses, for sale or job, at  
WHITE'S COACH MANUFACTORY, Westminster-road, opposite the Asylum;  
where may be seen a variety of New and Second-hand Carriages.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

**Major's Remedies for the Horse,**  
the best and most effectual ever discovered, superseding the "burning  
iron" and the torture of the "cautery."

MAJOR'S BRITISH REMEDY, for the cure of ringbone, spavins, splints  
&c. A single bottle sufficient to cure from four to six spavins, £1 15s.

MAJOR'S SYNOVITIC LOTION, (the Remedy, No. 2.) for gringness,  
weak joints, sprains of the back sinews, ruptures of the sheaths of tendons,  
suspensory ligaments, shoulder lameness, and inflammation; also for the cure  
and prevention of breaking down, &c.—In bottles, large size, £1 1s.; small,  
10s. 6d. each. The above invaluable remedies can now be forwarded to any  
part of the United Kingdom. Pre-payment by check or post-office order,  
made payable to Joseph Major, Post Office, Charing-cross.

JOSEPH MAJOR, Horse Infirmary, British-yard, Cockspur-street,  
Charing-cross.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.  
**Important Saving, by Pre-payment,**  
in the PURCHASE of

NEW WHITE MOULDED VIALS.  
APSLEY PELLATT and CO. submit the following PRICES of VIALS, for  
PRE-PAYMENT only:—  
½ oz., 1 oz., & 1½ oz. per Gross, 6s.  
2 oz. " 7s.  
3 oz. " 8s.  
4 oz. " 10s.  
6 oz. " 15s.  
8 oz. " 18s.  
4½ oz. graduated in 3 doses 12s. 6d.

In quantities of not less than  
Six Gross, assorted to suit the con-  
venience of the purchaser, deli-  
vered to carriers in London.  
No charge for Package.  
Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges  
whatever between the Manufacturer and the Consumer, no attention can be  
paid to any order not accompanied by a remittance in full, made payable in  
London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**King's College, London.—Medical**  
DEPARTMENT.—The WINTER SESSION, 1864-5, will Commence  
on Monday, October 2, 1864.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman,  
F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Ferguson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building,  
will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by  
Professors Partridge and Ferguson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and  
Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with  
every convenience for the attainment of Practical Chemistry, and for the  
prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the  
prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have  
the exclusive privilege of contending for three Warneford Scholarships of £25  
per annum, for three years. The subjects for the examination, which will  
commence on September 30, are, Divinity, Classics, Mathematics, History, and  
Modern Languages, equal marks being assigned to each subject. The classical  
books fixed on by the examiners for this year are the same as those announced  
for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of  
£20 each, tenable for two years, will be filled up in April next, the subjects of  
the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or  
upon application to J. W. Cunningham, Esq., Secretary.

June, 1864.

R. W. JELF, D.D., Principal.

**St. Mary's Hospital and Medical**  
SCHOOL.—The WINTER SESSION will Commence on Monday, the  
2nd of October, with an Introductory Address by Dr. ALDERSON, F.R.S., at  
Half-past Two o'clock.

LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James  
Lane.

Pathological Anatomy—Dr. Markham.

Chemistry—Dr. Albert J. Bernays.

Medicine—Dr. Chambers and Dr. Sibson.

Surgery—Mr. Coulson and Mr. Spencer Smith.

Clinical Medicine—Dr. Alderson.

Clinical Surgery—Mr. Ure.

SUMMER SESSION, 1865, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.

Materia Medica—Dr. Sieveking.

Practical Chemistry—Dr. Albert J. Bernays.

Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.

Medical Jurisprudence—Mr. Ancell.

Military Surgery—Dr. James Bird, F.R.C.S.E.

Ophthalmic Surgery—Mr. White Cooper.

Aural Surgery—Mr. Toynbee.

Dental Surgery—Mr. Naammyth.

Comparative Anatomy—

Natural Philosophy—

HOSPITAL PRACTICE.—The hospital contains upwards of 150 beds, 65 of  
which are devoted to Medical, and the rest to Surgical, cases. This division  
includes a ward appropriated to the Diseases of Women, and also beds for  
Ophthalmic and Aural cases. A Maternity Department is attached to the  
hospital: 218 poor married women were delivered at their own homes during  
the past year. The In-patients are visited daily by the Physicians and Surgeons,  
at one o'clock. Lectures on Clinical Medicine will be regularly delivered by  
Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the  
other Medical Officers in their respective departments. The Out-patients are  
attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and  
are appointed for eighteen months; two non-resident Medical Officers; a  
Medical and a Surgical Registrar. Clinical Clerks and Dressers will be selected  
from the best-qualified Students. All the above offices are open to competition  
amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the  
School, who will also furnish the names of gentlemen in practice in the  
vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 8th, 1864.

H. SPENCER SMITH,  
Dean of the School.

## School of Anatomy and Medicine,

adjoining St. George's Hospital.—The WINTER SESSION will commence on Monday, October 2, 1854.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by Mr. Lane.

Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.

Chemistry—Mr. J. E. D. Rodgers.

Medicine—Dr. Cornack and Dr. Ballard.

Surgery—Mr. Pilcher and Mr. Spencer Wells.

Midwifery—Mr. Bloxam.

Materia Medica—Dr. Ballard.

Forensic Medicine—Dr. B. W. Richardson.

Botany—Dr. Lankester.

Practical Chemistry—Mr. J. E. D. Rodgers.

Comparative Anatomy and Zoology—Mr. R. T. Hulme.

For further particulars and prospectuses, apply to Dr. Lankester, 22, Old Burlington-street; Mr. R. W. Burford, at the School, 1, Grosvenor-place; or at the residences of the respective Lecturers.

## St. George's Hospital Medical School,

LONDON.—SESSION, 1854-55.

The WINTER COURSE OF INSTRUCTION will commence on Monday, October 2nd, when the SCHOLARSHIPS and PRIZES for the past year will be awarded.

The Hospital contains 350 beds. Attendance of the Physicians and Surgeons daily, at One o'clock. Surgical Operations on Thursday, at One o'clock.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

Gentlemen becoming Pupils of the Hospital may attend all the Lectures, and the Medical and Surgical Practice necessary for those who desire to become Members of the Royal College of Surgeons, or Licentiates of the Society of Apothecaries, on paying Forty Guineas at the commencement of the first year, Forty Guineas at the commencement of the second year, and Twelve Guineas at the commencement of the third year.

The payment for the year will admit the Pupil to all the Lectures, and to the Hospital Practice required, for that year only.

Special entries to Hospital Practice, or to any separate Course of Lectures, may be made as heretofore.

Some of the Lecturers and other gentlemen connected with the Hospital receive Students to reside with them.

Further information may be obtained from the Secretary of the Hospital, or from Mr. Hammerton, the Apothecary of the Hospital, who is authorized to enter the names of Students.

## University College, London.—

FACULTY OF MEDICINE. SESSION, 1854-55.—The Classes will commence on Monday, the 2nd of October. Introductory Lecture by Professor CARPENTER, M.D., at Three o'clock.

Classes in the order in which Lectures are delivered during the day:—

### WINTER TERM.

Anatomy—Professor Ellis.

Anatomy and Physiology—Professor Sharpey, M.D., F.R.S.

Chemistry—Professor Graham, F.R.S.

Comparative Anatomy—Professor Grant, M.D., F.R.S.

Surgery—Professor Erichsen.

Medicine—Professor Walshe, M.D.

Dental Surgery—Hubert Shelley, M.B.

Practical Anatomy—The pupils will be directed in their studies during several hours daily by Professor Ellis and Dr. Boon Hayes, Demonstrator.

### SUMMER TERM.

Botany—Professor Lindley, Ph. D., F.R.S.

Pathological Anatomy—Professor Jenner, M.D.

Paleo-Zoology—Professor Grant, M.D.

Practical Chemistry—Professor A. W. Williamson, Ph. D.

Midwifery—Professor Murphy, M.D.

Forensic Medicine—Professor Carpenter, M.D., F.R.S.

Ophthalmic Medicine and Surgery—Professor T. W. Jones, F.R.S.

Materia Medica—Professor Garrod, M.D.

Analytical Chemistry—Professor Williamson, throughout the Session. Logic, French, and German Languages, Natural Philosophy, Geology, and Mineralogy—according to announcement for the Faculty of Arts.

### CLINICAL INSTRUCTION.

Hospital Practice daily throughout the year.

Physicians—Dr. Walshe, Dr. Parkes, and Dr. Garrod.

Obstetric Physician—Dr. Murphy.

Assistant Physicians—Dr. Jenner, Dr. Hare.

Surgeons—Mr. Quain, Mr. Erichsen.

Consulting Surgeon to the Eye Infirmary—Mr. Quain, F.R.S.

Ophthalmic Surgeon—Mr. Wharton Jones.

Assistant Surgeons—Mr. Marshall, Mr. Statham.

Dental Surgeon—Mr. Shelley.

Medical Clinical Lectures by Dr. Walshe and Dr. Garrod; also by Dr. Parkes, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease, and who gives a series of lessons and examinations on the Physical Phenomena and Diagnosis of Disease to classes consisting of a limited number, and meeting at separate hours.

Surgical Clinical Lectures, specially by Mr. Quain, and by Mr. Erichsen.

Lectures on Ophthalmic Cases, by Mr. Wharton Jones.

Practical Instruction in the Application of Bandages and other Surgical Apparatus—by Mr. Marshall.

Prospectuses may be obtained at the office of the College.

RESIDENCE OF STUDENTS.—Several of the Professors receive students to reside with them; and in the office of the College there is kept a register of parties unconnected with the College who receive boarders into their families. Amongst these are several medical gentlemen. The register will afford information as to terms and other particulars.

G. VINER ELLIS, Dean of the Faculty.

CHAS. C. ATKINSON, Secretary to the Council.

The Lectures to the Classes of the Faculty of Arts will commence on Tuesday, the 17th of October.

The Junior School will open on Tuesday, the 26th of September.

## Dr. Barron's Medical and Surgical

TUITION adapted to gentlemen preparing for Professional Examinations will be resumed, after the present vacation, on September 25th.

The regular WINTER COURSE will commence on 2nd October.

15, St. Thomas'-street, Borough.

## London Hospital Medical College.—

The WINTER SESSION will commence on Monday, October 2nd, when an Inaugural Address on the opening of the New College will be delivered by Dr. LITTLE, at Three p.m.

Medicine—Dr. Little.

Surgery—Mr. Curling, F.R.S., and Mr. Critchett.

Descriptive and Surgical Anatomy—Mr. Adams.

General Anatomy and Physiology—Dr. Carpenter, F.R.S.

Practical Anatomy—Mr. N. Ward, Mr. Wordsworth, and Mr. Gowland.

Chemistry—Dr. Letheby.

Pathological Histology—Dr. Clark.

Dental Surgery—Mr. Barrett.

SUMMER SESSION, 1855, commencing May 1st.

Midwifery—Dr. Ramsbotham.

Materia Medica—Dr. Davies.

Forensic Medicine—Dr. Ramsbotham and Dr. Letheby.

Botany—Mr. Bentley.

Comparative Anatomy—Mr. Coles.

Practical Anatomy—Dr. Letheby.

General fee to the Lectures, £50; to the Hospital Practice and Lectures, eighty-four guineas, payable in two instalments of forty-two guineas each, at the commencement of the two first Winter Sessions. Applications by post to be made to the Honorary Secretary.

## Chatham Street School of Medicine,

MANCHESTER.—The SESSION for 1854-55 will commence on Monday, October 2nd, when the Introductory Address will be delivered by Dr. Whitehead, at Four p.m.

Extensive alterations have been made in the premises of this Institution during the recess. The present Lecture Theatre is considerably larger than the previous one, and is much better adapted both for hearing and for demonstration. The Museum has undergone complete review, and the various objects of interest have been so arranged and designated as to afford every facility to the Student in the prosecution of his studies.

Practical Chemistry will be taught during the present Session under the same roof, in additional premises, which have been already secured for the purpose.

The Lecturers have the pleasure of stating that Dr. Marshall Hall has kindly promised to deliver, sometime during the Session, a short Course of Lectures on "The Spinal System of Nerves and its Diseases," in the Lecture Theatre of this Institution, to which members of the Profession, in this locality, will be invited.

WINTER LECTURERS.—Mr. Southam, Mr. Dumville, Dr. Watts, Dr. Eason Wilkinson, Dr. Noble, Messrs. J. S. and J. O. Fletcher, Mr. Murphy, and Mr. Stone.

SUMMER LECTURERS.—Dr. Whitehead, Dr. Merel, Dr. Aikenhead, Mr. Somers, Dr. Jepson, Dr. Stone, Dr. Watts, and Mr. Stone.

HOSPITAL PRACTICE and Clinical Instruction at the Royal Infirmary.

SCHOLARSHIPS.—In addition to the usual Medals, Prizes, and Certificates of Merit, Three Scholarships will be offered for competition, at the termination of the Session, as follows:—

One of £20—for Third Year's Students.

One of £15—for Second Year's Students.

One of £10—for First Year's Students.

Further particulars may be obtained from the Registrar, Mr. SOUTHAM, Salford, or from any of the Lecturers.

Chatham-street, Piccadilly. August, 1854.

## Queen's College, Birmingham.—

The WINTER SESSION will commence on Tuesday, the 3rd day of October next, when an Introductory Address will be delivered at Two o'clock, by R. D. GRAINGER, Esq., F.R.S.

The system of study pursued at this College constitutes a complete course of Collegiate, Medical, and Surgical education. The Lectures qualify for Examination for appointments in the Army and Navy and the East India Company's Service, for the Degrees of M.B. and M.D. of the University of London, for the Diploma of the Royal College of Surgeons, and the License of the Society of Apothecaries, without any residence elsewhere.

A married Tutor, in Holy Orders, a Graduate of Oxford, resides within the walls of the College, to whom is committed by the Council the superintendence of all Resident Students, under Collegiate discipline, and also the surveillance of Non-Resident Students.

### THE WINTER SESSION.

Surgical Anatomy—Professor Sands Cox, F.R.S., Fellow of the Royal College of Surgeons of England; Senior Surgeon of the Queen's Hospital.

Descriptive Anatomy—Professor Parker, Fellow of the Royal College of Surgeons of England; Surgeon to the Queen's Hospital.

General Anatomy and Physiology—Professor Heslop, M.D., Physician to the Queen's Hospital.

Practical Anatomy, with Superintendence of Dissections—Mr. David Bolton, Fellow of the Royal College of Surgeons; and Mr. Walter Careless Freer, M.R.C.S.

Chemistry—Professor George Shaw, Fellow of the Geological Society. Principles and Practice of Medicine—Professor James Johnstone, M.D., (Cantab.), Fellow of the Royal College of Physicians of London; Senior Physician to the General Hospital.

Principles and Practice of Surgery—Professor Sands Cox, F.R.S., Senior Surgeon to the Queen's Hospital.

Medical Tutor—R. C. R. Jordan, M.R.C.S., M.B.

Clinical Lectures will be delivered Weekly, by the Professors.

CHEMICAL LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience, for the attainment of a knowledge of Practical Chemistry, and for the prosecution of Scientific researches. The Students have also, under certain regulations, access to the Botanical Gardens.

For further information, application may be made to Mr. Sands Cox, Dean of the Faculty, 24, Temple-row; or to Mr. Langston Parker, Honorary Secretary to the Professors, 20, Colmore-row, Birmingham; from whom may be obtained, on receipt of two penny stamps, the Prospectuses of the Medical Departments.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.

N.B. A Chemical Laboratory on the Premises.

## Guy's.—John Masterman, Esq., M.P.,

having placed at the disposal of the Treasurer a Third Appointment of ASSISTANT SURGEON in the Honourable the East India Company's Service, the same will be competed for by the Students of this School. Candidates must be Members of the Royal College of Surgeons, having their Diplomas dated since October 1st, 1853, and are requested to forward their names to James Stocker, Esq., on or before October 7th, 1854.

By order,

Guy's Hospital, 15th August, 1854.

JNO. CHAS. STEELE, Supt.

EAST INDIA HOUSE, August 9th, 1854.

## Notice is hereby given, that the

annexed CODE of REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the Affairs of India, under the provisions of the Act 16 and 17 Vict. cap. 95, sec. 33.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons; they must, however, be between twenty-two and twenty-eight years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration pursuant to the Act 6th and 6th William IV., cap. 62.
2. A diploma in surgery or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.
3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least, on an average, 100 in-patients, or of having attended one course of lectures of six months on the practice of physic and clinical instruction for twelve months.
4. A certificate of having attended for three months the practical instruction, given at one of the public asylums for the treatment of the insane.
5. A certificate of having attended for three months one of the institutions, or wards of a hospital, especially devoted to the treatment of ophthalmic disease.
6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.
7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination, to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.
2. Medicine, including the diseases of women and children, therapeutics, pharmacy, and hygiene.
3. Anatomy and physiology, including comparative anatomy.
4. Natural history, including botany and zoology.

The examination will be conducted:—

1. By means of written questions and answers.
2. By object examinations and experiments, when the subject admits of such tests.
3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.
4. By *visu et tactu* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's service.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Asylum also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information, if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MAXWELL, Secretary.

## Royal College of Surgeons of Eng-

LAND.—The Certificates of Attendance, by Candidates for the Diploma of this College, on the Medical Practice of a Hospital, commencing on or after the 1st of October, 1854, must be accompanied by Certificates of Attendance on Clinical Lectures on Medicine during such attendance; and the Certificates of Attendance, by such Candidates, on the Surgical Practice of a Hospital, commencing on or after the said 1st of October, 1854, must be accompanied by Certificates of Attendance on Clinical Lectures on Surgery during such attendance. Such Courses of Clinical Lectures shall, in England and in the Colonies, consist of not less than one Lecture on Medicine and one Lecture on Surgery in each week during the Summer and Winter sessions; and in Scotland and Ireland shall consist of such number of Lectures as may be respectively required by the Royal Colleges of Surgeons of Edinburgh and Ireland. These Lectures shall be additional to Clinical Instruction given in the wards, and shall have especial reference to cases at the time, or previously under observation in the Hospital.

August 10th, 1854.

EDMUND BELFORD, Secretary.

## Birmingham and Midland Counties

LYING-IN HOSPITAL AND DISPENSARY FOR THE DISEASES OF WOMEN AND CHILDREN.—Wanted, a RESIDENT SURGEON, whose duty will be to attend Cases. He must be either a Member of the Royal College of Surgeons, or Licentiate of the Apothecaries' Company.

For particulars, apply to Mr. DAVID COPE, Secretary, Lying-in Hospital, Broad-street, Birmingham.

## West Herts Infirmary, Hemel

HEMPSTEAD.—The Election of a HOUSE-SURGEON to the above Institution will take place on Saturday, the 26th inst., at One o'clock. Candidates for the appointment must send in their testimonials to the Infirmary before Thursday, the 24th inst., and attend in person on the day of election. The Salary is £100 per annum, with apartments and attendance, coals and candles.—Further particulars may be had on application to the Secretary.

## Loughborough Dispensary.—

Wanted, a RESIDENT HOUSE-SURGEON and APOTHECARY to the above Institution. He must be a Member of the Royal College of Surgeons, and Licentiate of the Apothecaries' Company. The Salary is £80 per annum, with furnished apartments for a single man, coals, candles, and attendance. A Compounder of Medicines is provided at the expense of the Institution.—Testimonials, directed to Mr. Brock, Baxter-gate, Loughborough, to be sent in on or before the 2nd of September next.

RICHARD NICKLINSON, Loughborough.

## Manchester Royal Infirmary,

DISPENSARY, LUNATIC HOSPITAL, or ASYLUM.—Wanted, in consequence of the resignation of Mr. F. A. Heath, who has completed the period of his engagement, an unmarried Gentleman, as HOUSE SURGEON to these Charities. Every candidate for the office will be required to produce a Diploma from the Royal College of Surgeons in London, Edinburgh, or Dublin, and a License from the Worshipful Society of Apothecaries in London. The duties of the house surgeon are, to assist the surgeons at operations, and in dressing the patients; to visit the patients in the absence of the surgeons, under whose control he is to consider himself; and to take charge of the accidents in the absence of the surgeon of the week. He must take an engagement for one year. No salary is given; but the whole medical and surgical practice of the house will be open to him; and he will be provided with board and lodging in the Infirmary.—Letters from candidates, together with the diplomas and testimonials, are to be sent, free of postage, on or before Saturday, the 26th August next, addressed to the Secretary.

By order of the Board,

Weekly Board, July 31st, 1854.

R. THORPE RADFORD, Secretary.

## County and City of Worcester

PAUPER LUNATIC ASYLUM, POWICK, near WORCESTER.—Wanted, a MEDICAL SUPERINTENDENT, who can immediately enter upon the duties of this establishment. He will be expected to devote the whole of his time and energies to the duties of his office, and be precluded from private practice. Preference will be given to a gentleman who has had experience in a Public Lunatic Asylum. The salary is £350 a year, together with Furnished Apartments, Coals, Candles, Washing, and Vegetables from the garden. He will have to board himself, and find his own linen. Candidates to state their age, whether married or single, and what family (if any). Testimonials (sealed up) to be sent to Mr. Martin Curtler, Solicitor, Worcester, before the 28th instant. The Election will take place on Monday, the 4th of September.

MARTIN CURTLER, Clerk to the Committee of Visitors.

Worcester, August 14th, 1854.

N.B. It is particularly requested that no application shall be made to any member of the Committee or their Clerk, by or on behalf of any candidate. If any such is made, it will be held a disqualification.

## Clerical, Scholastic, and Governess

AGENCY OFFICES, (late Valpy, Established 1833), 7, TAVISTOCK-BOW, COVENT-GARDEN, LONDON. The gentry and families requiring Tutors, Governesses, or Companions, for either residence, travelling, or daily attendance, on making known their requirements to Messrs. MAIR and SON, will at once be introduced FREE OF CHARGE to qualified and experienced applicants with good testimonials. Schools recommended, and Ecclesiastical and School property transferred. A prospectus forwarded on application.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAWRENCE CUTLER, 12, John-street, Adelphi, London.

# Messrs. Lane and Lara,

MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

## Partnership in Devon.—Price only

£400, One Half-Share in a first-class COUNTRY PRACTICE, yielding £600 per annum, without Appointments or Contracts, and at once extendible to £900, with the aid of an active and gentlemanly Partner. As the Senior Partner retires forthwith, from ill-health, an immediate arrangement is indispensable.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## Near Charing-cross.—A General

PRACTICE and RETAIL, well established, and yielding between £500 and £600 a-year, is for SALE. Price, to include valuable Lease, Stock, Fixtures, and such Introduction as may be wished, £660. Rent, by letting, may be made almost nominal.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## In a Railway Market-town in the

South of England, having a Population of 7000, a GENERAL PRACTICE of £400 a-year can be Transferred with certainty to a doubly-qualified Gentleman, being a member of the Established Church. Premium for the necessary Introduction, £450, the Purchaser enjoying the entire receipts from the day of entry.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

### TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## To be Disposed of, a General Medical

PRACTICE, in a country town in the West of England, realizing upwards of £400 per annum. Several months' Introduction will be given.—Address, M.D., Post-office, Wimbledon, Putney, near London.

### TO SURGEONS.

## A gentleman, aged 40, who has been

accustomed to Visit, attend Midwifery, and Dispense, wants a situation as ASSISTANT. Will prefer an out-door Assistantship.—Address, Mr. Norton, care of Mr. Hathway, Surgeon, Green-hill-lane, Alfreton, Derbyshire.

## Wanted, a situation as Curator's

ASSISTANT in a Museum, or ANATOMICAL PORTER in a Medical School. The Advertiser has filled both situations, for some years past, to the satisfaction of his employers. Testimonials from high authorities in the profession.—Address W. H., 101, Grove-street, Camden-town.

## Wanted, by a gentleman, M.R.C.S.

and L.S.A., a Situation as Visiting ASSISTANT. A large town would be preferred. Unexceptionable references as to professional and moral character can be given.—Address, T. H. M., Messrs. B. Moxon and Sons, 17, Church-lane, Hull.

## Wanted, by a General Practitioner,

a duly qualified ASSISTANT, to Visit and Dispense. He must have a thorough practical knowledge of his profession, be of active habits, and unexceptionable character, between twenty-six and thirty-four years of age. He will be required to reside in the house.—Apply to Mr. Gray, 12, Montague Place, Poplar.

## A Gentleman, aged 21, wishes for a

Situation as ASSISTANT, where, in consideration of his services, he would be allowed to attend Lectures and receive board and lodging. He is an accomplished Accoucheur, used to Union and Private Practice, Operations, Dispensing, &c. Satisfactory testimonials can be given.—Address, G. C., THE LANCET Office, 423, Strand.

### MEDICAL.

## A good Introduction to a Practice

in a country town, and the district round, will be given, on moderate terms, by the Widow and Friends of a Surgeon, lately deceased. For a General Practitioner, it would be a very favourable opportunity of establishing a good practice. The House occupied by the deceased may be rented upon reasonable terms.—Address Mr. W. Jessop, Solicitor, Cheltenham.

## Wanted, by the Resident Surgeon of

the Stoke Newington Dispensary, a gentleman to act as his ASSISTANT. A gentleman who would take the situation with a view of obtaining an extended practical knowledge of his Profession, and who possesses one of the diploma, preferred. The Resident Surgeon has also a Vacancy for an Out-door PUPIL.—Apply personally, or by letter, addressed to the Resident Surgeon, Dispensary, Stoke Newington, Middlesex.

### Medical Transfer and Partnership.

30, Bucklersbury, London.

## Mr. Orridge, Medical Transfer Agent

and Referee, in offering his services (his Profession, takes leave to point out that the instrumentality of his extensive connection enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

## Medical Practice at Brighton.—An

Introduction for a few weeks to numerous respectable patients; and the possession of a very convenient, low-rented house, with garden, in a commanding situation, may be obtained, in consequence of the present Proprietor being about to leave England. The furniture by valuation.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

### MEDICAL.

## London.—A Practice and Retail

(with residence very eligibly situated near the Clubs) is to be Disposed of immediately, in consequence of the death of the Proprietor, who conducted it for the last twelve years. The opportunity will be found eligible for obtaining an extensive and lucrative practice.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

## Six Hundred Pounds Per Annum.—

GENERAL PRACTICE.—A PRACTICE in a good market-town, easily accessible from London, is now Transferable (with competent Introduction) for One-year's Purchase. There is an excellent family residence. The connection includes several families of high standing, and has been held near twenty years by the retiring Practitioner.—Apply to F.R.C.S., care of Mr. ORRIDGE, 30, Bucklersbury.

## Six Hundred Pounds Per Annum.—

LONDON.—A PRACTICE, on the Surrey side, is Transferable, with three months' Introduction, for £450. Rent low. The residence is a corner one.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

### TO SURGEONS AND CHEMISTS.

## Seven Hundred Pounds Per Annum.

A Business returning this sum in Retail is for Disposal, and is well situated for a Medical Man. The Shop is large, handsome, and long-established, in the main street of one of the metropolitan boroughs, and the house modern and replete with convenience. Price £700.—Apply to M. F. S., care of Mr. ORRIDGE, 30, Bucklersbury.

## Madeira. — A Married Clergyman,

about to return to the Island, can take charge of PUPILS.—Address X. Y. Z., 54, Baker-street, from the 19th to the 24th instant.

## Wanted, by a Surgeon in the Country,

a Visiting and Dispensing ASSISTANT. A practical knowledge of Midwifery necessary.—Address, stating age and references, G. A. H., THE LANCET Office, 423, Strand, London.

## A Gentleman, aged 30; (unqualified,)

wishes for a Situation as ASSISTANT to a Surgeon. He has had much practical experience, particularly in Midwifery.—Address, Alpha, care of Mr. Hollings, 297, Strand, London.

## Wanted, by a Member of the College

of Surgeons and Licentiate of the Apothecaries' Company, a PARTNERSHIP, either in the town or county of Leicester.—Address, Medicus, care of George Canham, Esq., Ledbury-terrace, Bayswater.

## An old-established Village Practice,

where there is no opposition, may be had for £150, down. A Club and District of Union may be had. Some necessary fixtures will be included for the sum named.—Apply by letter, to A.B., care of Messrs. Hodgkinson and Tonge, 213, Upper Thames-street, London.

### MEDICAL.

## An M.D. and Surgeon, aged 28,

unmarried, who has had much practical experience in his profession, wishes an ASSISTANTSHIP. Satisfactory references as to character, &c., will be given.—Address, Medicus, 163, Stockwell-street, Glasgow.

### TO SURGEONS, &c.

## Near Cavendish-square, a desirable

CHEMIST'S RETAIL for Transfer, that would afford an Opening to a select and extensive Practice. Premises in excellent repair, and at a moderate rent. Purchase, £350.—Apply to Mr. Jacobson, No. 88, Walbrook, near the Mansion-house, City.

## A married gentleman, 25 years of

age, possessing the double qualification, is desirous of either entering into Partnership with an elderly gentleman who wishes to retire from his profession in the course of a few years, or of Purchasing a Practice where an introduction of twelve months, by way of partnership, could be given. The income required in either case, about £600 a year. Most satisfactory references could be given, and would be required.—Address, A. B., THE LANCET Office, 423, Strand.

## NOTICE OF REMOVAL.

**MR. CHURCHILL** informs his Friends and the Profession at large, that after having been established (with his Predecessors) in PRINCES-STREET for Seventy Years, he has REMOVED to

No. 11, NEW BURLINGTON-STREET,

where he has secured Premises more adapted to the extended PUBLISHING BUSINESS which it is both his pleasure and advantage to conduct.

Just published, with Maps, 8vo, cloth, 16s.

### Royal College of Physicians.—

REPORTS on EPIDEMIC CHOLERA, its Cause and Mode of Diffusion, Morbid Anatomy, Pathology and Treatment. Drawn up at the desire of the Cholera Committee. By WILLIAM BALY, M.D., F.R.S., Physician to Millbank Prison, and WILLIAM W. GULL, M.D., Assistant-Physician to Guy's Hospital.

London: John Churchill, New Burlington-street.

Just published, 8vo, price 2s.

### A Letter to the President and

FELLOWS OF THE ROYAL COLLEGE OF PHYSICIANS, in relation to the Evidence cited in their late Report on the Treatment of Epidemic Cholera. By JOSEPH AYRE, M.D., Chairman of the Sanitary Committee of the Local Board of Health.

London: John Churchill, New Burlington-street.

Just published, Second Edition, 8vo, cloth, 4s.

### The Nature of Cholera Investi-

GATED. By JOHN GEORGE FRENCH, F.R.C.S., Surgeon to the Infirmary of St. James's, Westminster.

"This is one of the best treatises on cholera which we have lately read. His theory of the nature of cholera is ingenious, and is argued with acuteness."—MEDICAL TIMES AND GAZETTE.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 4s. 6d.

### Asiatic Cholera; its Symptoms,

Pathology, and Treatment. By RICHARD BARWELL, F.R.C.S., late House-Surgeon, and now Demonstrator of Anatomy, at St. Thomas's Hospital. To which is added, a Translation of its Morbid Anatomy, General and Minute, from a Paper by Messrs. REINHARDT and LEUBUSCHER.

"The chapter on the Morbid Anatomy is very interesting. The book exhibits considerable ability."—MEDICAL TIMES.

"Here is a book well worthy of attention, for Mr. Barwell writes from the bedside of the numerous cholera patients placed under his care at St. Thomas's Hospital."—THE LANCET.

London: John Churchill, New Burlington-street.

WORKS BY MR. COULSON,  
SURGEON TO ST. MARY'S HOSPITAL.

### On Lithotrity and Lithotomy; with

Engravings on Wood. 8vo, cloth, 8s.

"The most complete monograph upon the subject which has yet appeared in our language."—ASSOCIATION MEDICAL JOURNAL.

II.

### ON DISEASES OF THE BLADDER AND PROSTATE

GLAND. The Fourth Edition, revised and enlarged. 8vo, cloth, 10s. 6d.

"Mr. Coulson's work may be stated to be full and practical, to fill a vacant space in medical literature, and to be highly valuable to both students and practitioners."—MEDICAL TIMES.

"The practical and comprehensive character of Mr. Coulson's volume claims for it a place in the library of every surgeon who desires to be on a level with modern improvements."—LONDON JOURNAL OF MEDICINE.

London: John Churchill, New Burlington-street.

Just published, Second Edition, 8vo, cloth, 20s.

### On Diseases of the Urinary and

GENERATIVE ORGANS, (in both Sexes.) Part I. Non-Specific Diseases. Part II. Syphilis.

By WILLIAM ACTON, late Surgeon to the Islington Dispensary.

"Mr. Acton's work must be diligently studied by every practitioner who would desire to benefit, instead of injuring, his patient. It has a distinctive and pre-eminently diagnostic value."—MEDICAL GAZETTE.

"The present edition of Mr. Acton's work is very much enlarged, and contains a most valuable collection of matter."—THE LANCET.

"A section on which great labour has been bestowed is that on Spermatorrhea."—PROVINCIAL MEDICAL JOURNAL.

"We have no doubt Mr. Acton's treatise will take its place among the standard treatises in medical literature—a position to which its merit so well entitles it."—DUBLIN MEDICAL PRESS.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 10s. 6d.

### The Principles and Practice of the

WATER CURE, and HOUSEHOLD MEDICAL SCIENCE, in Conversations on Physiology, on Pathology, on the Nature of Disease, and on Digestion, Nutrition, Regimen, and Diet. By JAMES WILSON, M.D.

London: John Churchill, New Burlington-street, Malvern: Henry Lamb.

Just published, with Plates, 8vo, cloth, 10s. 6d.

### On some Diseases of Women

ADMITTING OF SURGICAL TREATMENT. By ISAAC BAKER BROWN, Surgeon-Accoucheur to St. Mary's Hospital.

London: John Churchill, New Burlington-street.

Just published, fcap. 8vo, cloth, 6s.

### Clinical Lectures on Paralysis,

DISEASE of the BRAIN, and other AFFECTIONS of the NERVOUS SYSTEM. By ROBERT B. TODD, M.D., F.R.S., Physician to King's College Hospital.

"The work will soon be in the hands of every practitioner who desires to be informed of the present state of knowledge in regard to diseases of the nervous system. It is exceedingly easy reading, and replete with just such information as the scientific practitioner requires."—MEDICAL TIMES AND GAZETTE.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 5s.

### Epilepsy, and other Affections of the

NERVOUS SYSTEM which are marked by Tremor, Convulsion, or Spasm: their Pathology and Treatment. By CHAS. BLAND RADCLIFFE, M.D., Assistant-Physician to the Westminster Hospital.

"This sketch will serve to make our readers aware of the important nature of the book under notice. Sufficient has been said to show the grounds upon which Dr. Radcliffe hopes to effect a complete revolution in all matters relating to the pathology and treatment of epilepsy and the cognate disorders, and to stimulate inquirers to read the book itself."—THE LANCET.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 4s.

### Lectures on Strabismus, delivered

at the Westminster Hospital. By C. HOLTHOUSE, Assistant-Surgeon and Lecturer on Anatomy to the Hospital.

"We have perused Mr. Holthouse's lectures with much pleasure. They contain not only an accurate exposition of the principles upon which the treatment of the disorder should be conducted, but also various original suggestions, which will prove useful to the oculist or surgeon in performing the operation; for, with all its improvements, it has not hitherto proved so invariably satisfactory as might be desired."—EDINBURGH MONTHLY JOURNAL.

London: John Churchill, New Burlington-street.

Just published, Third Edition, 18mo, cloth, 3s. 6d.

### Elements of Practical Midwifery;

or, Companion to the Lying-in Room. With Plates. By CHARLES WALLER, M.D., Obstetric Physician to, and Lecturer on Midwifery at, St. Thomas's Hospital.

"Students and practitioners in midwifery will find it an invaluable pocket companion."—MEDICAL TIMES AND GAZETTE.

London: John Churchill, New Burlington-street.

Just published, Third Edition, 8vo, cloth, 12s. 6d.

### On the Diseases of the Uterus. By

J. HENRY BENNET, M.D., late Physician-Accoucheur to the Western General Dispensary.

"We are firmly of opinion that in proportion as a knowledge of uterine diseases becomes more appreciated, this work will be proportionably established as a text-book in the profession."—THE LANCET.

"When, a few years back, the first edition of the present work was published, the subject was one almost entirely unknown to the obstetrical celebrities of the day; and even now we have reason to know that the bulk of the profession are not fully alive to the importance and frequency of the disease of which it takes cognizance. The present edition is so much enlarged, altered, and improved, that it can scarcely be considered the same work."—DR. RANKINE'S ABSTRACT.

London: John Churchill, New Burlington-street.

Just published, with Two Illustrations, in double-tinted Lithography, post 8vo, cloth, 4s.

### Sandgate as a Residence for Invalids.

By GEORGE MOSELEY, M.R.C.S., Surgeon to Sandgate Dispensary.

London: John Churchill, New Burlington-street. Sandgate: S. & M. Purday.

PRINTED BY THOMAS CHAPMAN SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, August 10, 1864.

## British Medical Directory for 1855.

All duly-qualified Medical Practitioners are respectfully requested to forward, as soon as possible, their "ENTRIES" or "RETURNS" for this Annual Volume. References to the Entries in the Directory for the current year (1854), stating that they are correct, will be sufficient. When alterations are required, they should be distinctly specified, and in all cases the names of the writers should be written clearly, and at full length.—Address to the Editors at the "British Medical Directory" Office, 423, Strand.

Now ready, in fcp. 8vo.

Dr. Pereira's Lectures on Polarized LIGHT. A New Edition, edited by the Rev. BADEN POWELL, M.A., F.R.S.

London: Longman, Brown, Green, and Longmans.

Now ready, Second Edition, in 8vo, boards, price 7s. 6d.

Dr. Collier's Code of Safety, or Laws OF EPIDEMICS.

Ne quid detrimenti respublica capiat.

London: Longman, Brown, Green, and Longmans.

## AN ILLUSTRATED LIST OF

Forty Medical and Scientific Works.

EPIDEMICS EXAMINED AND EXPLAINED. Price Five Shillings.

James Ridgway, Piccadilly; and all Booksellers.

Just published, in one thick volume, fcp. 8vo, (755 pp.) price 12s. 8d. cloth,

## A Manual of Practical Therapeutics;

considered chiefly with reference to Articles of the Materia Medica. By EDWARD JOHN WARING, M.R.C.S., H.E.I.C.S.

"Mr. Waring's Manual presents, in a concise form, the information which the medical man requires to guide him in prescribing the most suitable remedies. It will, we think, obtain favour with the medical public for the extent and usefulness of the information it contains, as well as from the fact of its filling a gap which has been felt by many."—THE LANCET.

London: Smith, Elder, and Co., 65, Cornhill.

## HUNT ON STAMMERING.

Just published, in 8vo, price 3s. 6d., by post, 4s.

## A Treatise on the Cure of Stammering,

with a MEMOIR of the late THOMAS HUNT, Esq., Author of the "System for the Cure of Defective Articulation." By JAMES HUNT, M.R.S.L., &c.

"Mr. Hunt's cases are proofs of his skill in curing this malady."—ATHENÆUM.

"The mass of evidence is sufficient to convince the most sceptical."—MORNING POST.

"A valuable treatise."—JOHN BULL.

London: Longman and Co. To be had of all booksellers, and by post, from the Author, 125, Regent-street, London; and at Swanage, Dorset, during the months of August and September.

Just published, 8vo, cloth,

 TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, Illuminated, and Emblazoned on Vellum.  
 H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

**H. Silverlock's Medical Label Ware-**  
 house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.  
 The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.  
 Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**Allen's Illustrated Catalogue,** containing size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.  
 ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.  
 ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.  
 J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 18 & 22, WEST STRAND.

**Cocoa-nut Fibre Matting and Mats,**  
 of the best quality.—The Jury of Class 22, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

**Improved Invalid Cot Carriages—**  
 the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Biding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

**Rice Harris and Son, Islington**  
 GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**The 16s. Trousers reduced to 14s.—**  
 Trousers and Waistcoat, 25s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweed, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**To Professional Men and others.—**  
 The Oxford Mixed Docking Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.  
 S. BATTAM, Coat and Trousers Maker, 160, Tottenham-court-road, four doors south of Schoolbred and Co's.  
 Patterns of the material and Directions for Measuring sent free per post.

**To all who cannot get a Fit; the**  
 importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance.  
 R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.  
 R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**  
 receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at  
 L. PHILLIPS', 28, WEST STRAND, LONDON,  
 the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

**Novelty in Bedsteads, adapted for**  
 the Nursery, Sick Chamber, Sitting-room, and Drawing room.  
  
 HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattress complete, 35s.—the most complete article ever introduced to the public.—  
 To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

**Funeral Extortion avoided, by Exe-**  
 cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.  
 Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.  
 Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.  
 Originated in 1842.

**Teeth.—Mr. Alfred Jones, of Gros-**  
 venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 6d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

## Infants' New Feeding Bottles.—These

celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautifully an imitation of natural, that no infant ever refuses it.—BENJAMIN ELAM, 196, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSARIES: for which the cheapest and most convenient form is in the BROWN JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## JOZEAU'S COPAHINE MÈGE.

Or SACCHARATED CAPSULES, approved of by the French College of Physicians, successfully administered in the Paris and London Hospitals, and acknowledged by them to be the best remedy for the cure of certain diseases. (See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 6d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Haymarket, London, whose name is printed on the Government stamp; and all the principal Chemists.

IMPORTANT TO THE MEDICAL PROFESSION.

## Davenport's Syrup of the Iodide of QUININE AND IRON.

FROM DR. GOLDING BIRD.

"46, Russell-square.

"I have now for some time employed pretty largely the triple Compound of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the form of Syrup. I do not hesitate to express my opinion of its great value as a therapeutic agent. It has appeared to me that the Quinine assisted the assimilation of the Iron, and I have found it to be of very great value in cases in which the use of the Iodide of Iron is recognised. This triple Compound possesses many advantages over the simple Iodide, and not the least of them is the satisfactory manner in which it is tolerated by the stomach, especially if administered (as all preparations of Iron ought to be) immediately after a meal.

"GOLDING BIRD, A.M., M.D., F.R.S.

"Fellow of the Royal College of Physicians,  
"Physician and Professor of Materia Medica, at Gay's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with confidence testify to its marked efficacy in cases of Stenosis and Anemia, and, indeed, in all instances in which the exhibition of Iron and its Compounds is indicated. This preparation appears to combine all the therapeutic powers of its constituents, without their noxious qualities, which renders it an admirable medicine in the treatment of some of the disorders of Childhood.

"Maldon.

"Geo. P. MAY, M.D."

SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Insipitation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 24 per cent. of Quinine. 4s. 6d. per oz.

SYRUP OF THE IODIDE OF IRON (F.L.), 3s. per lb.

BI-MECONITE SOLUTION OF OPIUM. Professional testimonials acknowledge this preparation to be the most efficient sedative extant. The unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30 Drops. 6d. per oz.

COTYLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and 1s. per oz. also the Preserved Juice, 5s. 4d. per lb., as recommended by Mr. Salter, (of Poole), in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, GREAT RUSSELL-STREET, BLOOMSBURY.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipitated Juice. Dose, half a drachm to a drachm; 10s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) LIQUOR, or Fluid Extract, prepared by Spontaneous Insipitation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

GREAT REDUCTION IN PRICE OF

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.  
FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1853.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.  
"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

The Policies of this Office are a sure and safe provision for settlements, renewal of leases, security of debts, &c.

The Medical Attendant consulted as the Medical Adviser and Examiner of the Society, is awarded a fee of £2 2s., when the sum assured amounts to £250, and £1 1s. when under that sum. The Medical Practitioner also receives for business introduced by him the usual commission of ten per cent. on the first payment, and five per cent. on the payments of subsequent years.

The Society also claims the support of the Medical Profession on the following grounds:—

For several years the "Medical, Legal, and General" was the only Mutual Life Assurance Society connected with the Medical Profession.

The rates are lower than those of any other Medical Life Office.

Bonuses divided annually.  
Persons desirous of assuring Diseased or Rejected Lives will find that from the experience acquired by this Society it is enabled to accept such lives at rates both equitable and safe.

From the outset the expenses of management have been kept within the narrowest limit, consistent with the efficient working of the establishment.

Loans, Annuities, Endowments, and every form of assurance contingent upon Life, transacted at moderate rates.

ANNUAL PREMIUM FOR ASSURING £100 AT DEATH WITH PROFITS.

# TREATMENT OF CHOLERA AND DIARRHŒA

IN THE

VARIOUS HOSPITALS,\* INFIRMARIES, AND DISPENSARIES IN THE METROPOLIS.

## No. II.

ANXIOUS that our readers should be put in possession of the leading facts connected with the treatment of cholera in the metropolitan hospitals, infirmaries, prisons, and dispensaries, we began last week a sketch of the principal data which, at this early period of the epidemic, we have been enabled to collect, by the liberal co-operation of the officers of those institutions. We continue in this number the rapid summary which cannot of course offer at present that degree of completeness which might be desirable; but danger is imminent, the disease is fearfully raging amongst us, and we need hardly apologize for publishing suggestions which, by their practical bearing in a moment like this, may perhaps snatch a few cholera patients from the destruction which too frequently attends this awful disease.

Though very humbling, the confession will readily be made by medical men that the treatment of cholera does not rest upon a sure basis; or, in other words, that the means employed to combat the disease are not adopted from any complete knowledge of its intimate nature or pathology. We are constrained to treat symptoms, to watch the manner in which death seizes upon its victim, and endeavour to counteract the tendency to a fatal termination. The public, aware of this, and unjust to medical science, reproach us with our ignorance; make no account of the pathological arcana which have been unravelled in other diseases by patient investigators with the happiest practical results; forget past services, and that human beings must die, and lay at our door our inability of arresting the ravages of cholera. But who has fathomed the depths and obscurity which surround fevers of various kinds? Are we not restricted in small-pox, scarlatina, &c., to simply counteract the tendency to death, and treat symptoms without being acquainted with the intimate nature of the virus which lies at the root of the pathological phenomena? Is there anything positive known of the plague or yellow fever? Not that we wish to excuse one deficiency by pointing out another, but we merely desire to make public the absurdity of taunting professional men (who are ever so ready to expose themselves to all the risks connected with the contact of the sick) with their defective knowledge of the intimate nature of the choleraic poison.

From former investigations, and from what is passing before us, there can be no doubt about the existence of a virulent choleraic principle, which, at certain periods and under certain telluric and atmospheric circumstances, becomes diffused in various localities. This poison seems to act according as it is more or less concentrated, and it is plain that the best means of lessening its effects is to dilute it with pure air as much as possible. If, by some mechanical contrivance, a strong current of air could be forced for a sufficient time through the most ill-treated districts, the result would probably be an abatement of the epidemic; especially if the artificial hurricane could be made to penetrate those sad tenements where human beings are heaped up by hundreds, and where man, by his mere presence, becomes the destroyer of man. We are aware that the disease has been known to rage cruelly in villages situated in healthy localities; but it may be surmised that the amount of virus was in such cases very large, and that many predisposed individuals existed amongst the inhabitants.

That we are at present, one and all of us, surrounded by an atmosphere charged with the virulent choleraic principle, cannot for a moment be doubted, when we see the large number of persons applying with diarrhoea to the various public institutions. Amongst these there are a great majority who shun fruit and vegetables, and who were not before subject to bowel complaints; and hence it may be permitted to infer that the looseness, now so prevalent, depends on the action of the virus largely diluted with comparatively pure air. Nor is it less probable that a great many of those who are supplied with

astringent medicines would have manifested symptoms of cholera had not the tendency to or the actual diarrhoea been stopped. The dilute sulphuric acid, in half-drachm doses, is keeping its ground as a powerful astringent, and the fashion of giving it is well supported by the favourable results which are daily obtained both in public and private practice.

Much good would be done by house-to-house visitation; for the poor, though they apply in great numbers for looseness of bowels, are known to be, in general, careless respecting the importance of seeking relief in time. It has very justly been contended by modern writers on cholera that the premonitory diarrhoea almost always exists; and it would appear that the weakness consequent on the drain renders the patient an easy prey to the disease. And yet, judging by analogy, we might look upon the premonitory diarrhoea as an effort at eliminating the poison; and those holding this view would, of course, not feel inclined to check the process. In one of the hospitals (King's College) which we have visited for the especial purpose of learning which mode of treatment was adopted, we found Dr. Johnson, who has the charge of the cholera patients, carrying out this idea by the use of repeated doses of castor oil, to aid in the elimination of the poison by the bowels. Most of the cases thus treated have done well, and we leave our readers to judge for themselves. One feature in the treatment is almost general in all public institutions, and that is the warm bath; this seems to be universally approved of, and not without reason, for we have ourselves seen patients revive in a wonderful manner after remaining in the hot bath for about half an hour. Nor is the hot air bath neglected, and though it cannot be said that these means have been invariably efficacious, they are nevertheless of great value.

We found, in the course of our inquiries, that the tendency now exists in hospitals to separate cholera patients from the rest of the inmates, this precaution pointing clearly to a certain amount of belief in the contagiousness of the disease. At all events, it seems more humane, even supposing the disease incapable of being transmitted by contagion, to spare the ordinary patients the alarm and apprehension naturally consequent on witnessing the distressing scenes too frequently connected with the progress of the disease. In almost all hospitals wards have been set aside for the reception of cholera patients; and we are glad to say that up to the present time we have not heard of the disease spreading amongst the attendants upon the sick. Both the medical men and the nurses do their duty in an exemplary manner; and here, again, we have proofs, were any wanting, of the fearlessness and devotion with which hospital officials discharge the duties which devolve upon them. The following is a rapid sketch of the points of interest connected with the treatment of cholera in some of our charitable institutions, in addition to those noticed in *THE LANCET* of last week:—

## GUY'S HOSPITAL.

## CASES OF CHOLERA.

FROM the beginning of the epidemic about thirty patients have been admitted into this institution, being mostly very aggravated cases, generally collapsed, blue, and cold. Peter-sham ward, situated at the back of the hospital, and forming a semi-detached building, has been set aside for the reception of cholera patients; and in spite of the most energetic restorative means, in the shape of hot air, stimulants, &c. &c., about twenty out of the whole number have died.

With those patients who were not in so desperate a state, the saline treatment, by the mouth, seems to have had some success, as we were able to ascertain by the kindness of Mr. Stocker, the resident medical officer, who is in constant attendance on the patients. The solution is composed of carbonate of soda and common salt, and is given in an effervescent state, by the addition of lemon-juice. In some cases in which the purging was very considerable, the usual astringent mixture of catechu and opium was given with advantage. The injection into the veins of a saline solution was tried in one case; the operation did not lead to the patient's recovery, but he revived so much from collapse as to ask for some brandy. Starch injections with opium, and external warmth, seemed also to be of use.

At the time of our visit, August 18th, there were four cases in the men's wards and four on the women's side. The only very bad case was that of a negro sailor, and it was peculiar with him that the characteristic connected with the skin was of course absent; but when he was touched, the integument felt cold and shrivelled.

The women were all doing well, though on their admission

\* We place the hospitals in each series from east to west.  
No. 1617.

they had presented the usual alarming symptoms; the saline treatment had told very favourably upon them, the number of times it was given being regulated by the amount of sickness. A vast number of cases of diarrhoea had presented themselves amongst the out-patients, and the intestinal relaxation was generally stopped by the ordinary astringent draughts of catechu, opium, and chalk mixture.

There is a tendency in all hospitals to isolate cholera patients, so that the belief in the contagiousness of the disease seems to be gaining ground. But even supposing the affection non-contagious, it is certainly wise to spare the inmates of the hospital the sight of the sufferings and rapid destruction of persons visited by the epidemic.

We need hardly say that the south side of the river is by far more obnoxious to cases than the north districts; and yet, considering the great disproportion, the Borough hospitals do not present as large a number as might have been expected. This circumstance may perhaps be attributed to the rapidity with which the disease destroys patients, scarcely any time being left for conveying the sick to the hospitals.

### ST. THOMAS'S HOSPITAL.

#### CASES OF CHOLERA.

In this hospital about thirty-six cases of cholera have been admitted since July 26th; and from the records it is found that about eleven have died. It is very probable that amongst these cases there were some severe forms of diarrhoea.

The purging has generally been combated by sulphuric acid, as was pointed out to us by Dr. Bristowe, who, together with Mr. Whitfield, the resident medical officer, has the charge of the cholera cases. The treatment consists principally in the administration of an emetic, and the application of a mustard poultice to the pit of the stomach; then follows the hot-air bath, and subsequently creasote and bismuth are used to combat the vomiting. Calomel is not much employed, but scruple doses have been given in one or two cases, in which the result was not striking either way.

A feature worth mentioning is, that some two or three cases, presenting very urgent symptoms, recovered with the use of the remedies pointed out, whilst very little hope of saving them was entertained.

With one patient, the injection of a saline solution into the veins was performed; the man never rallied by the operation, and on a post-mortem examination, Dr. Bristowe discovered the supposed cause of failure, in the shape of a fibrinous clot, extending from the heart to a great distance along the aorta.

The cases were mostly instances of undoubted cholera Asiatica, with a few instances of diarrhoea, as mentioned above; and we have here also to note that the patients were placed in separate wards.

We must also observe that, in this hospital, as well as in King's College and St. George's, patients who had been admitted for other diseases, were attacked with cholera whilst inmates of the hospital. At the very outset of the epidemic, (July 26th), a man, about forty years of age, who had been subject to diarrhoea for several years, was admitted with articular rheumatism, under the care of Dr. Risdon Bennett. He was ordered to take a powder composed of mercury with chalk and rhubarb, and afterwards he was to use lemon-juice. The patient was attacked with diarrhoea, which was at first thought to be the effect of the purgative; when, however, the looseness became especially marked, Mr. Whitfield was sent for; but in spite of the most powerful astringent remedies the man sank in a few hours, with all the symptoms of cholera.

Another striking case is that of a woman, about fifty years of age, who was found by the police on Tower-hill, suffering from diarrhoea. She had just, upon the advice of a gentleman, been drinking sour milk. The patient was conveyed to this hospital, and had one grain doses of calomel every half-hour; but she died about twenty hours after admission.

### ST. BARTHOLOMEW'S HOSPITAL.

#### CASES OF CHOLERA.

From the 28th of July to the 14th of August, there have been admitted about forty cases of cholera, and of these patients about fourteen have died. The treatment has consisted, as was stated to us by Mr. Wood, the resident medical officer, of the warm bath, calomel and opium, (five grains to one,) ice, frictions, &c. But of these forty cases, about half were simple cases of diarrhoea, which latter complaint yielded to the usual astringent medicines. Mr. Wood has tried the inhalations of chloroform, but with little success. The wards called Bentley

and Lucas are situated in a detached building, with the operating-theatre, &c.; the back of each of these, with some wards below stairs, generally set apart for cases of delirium or erysipelas, have been given up for the use of the cholera patients.

In Lucas' (a female) ward, there have been altogether thirteen patients, of whom six have died. The calomel was generally pushed according as the vomiting continued, regard being had to the effects of the mercury. At the beginning of the epidemic, nearly all the cases of true cholera brought in died; and it may be reckoned that, up to the 14th of August, nearly two patients were lost out of every three.

That the locality has much influence on the development of the disease is well known. We saw an example of this fact on the 14th of August, when we observed two children, who came from Saffron-hill, lying in a desperate state in Lucas' ward, whilst the father was dying of cholera in Bentley. The utmost regularity exists here as to the administration of remedies, baths, frictions, &c., everything being kept ready in the wards. We are glad to say that none of the nurses and attendants have hitherto been attacked. We made the inquiry with the more solicitude as one of the sisters had, in the last epidemic, been rapidly carried off.

### KING'S COLLEGE HOSPITAL.

#### CASES OF CHOLERA.

The disease broke out in this hospital in the same manner which had been observed in the last epidemic—viz., it spread amongst the patients already in the house, after a cholera patient had been brought in. The contagious nature of the epidemic was perhaps never made so likely as by the facts connected with this institution, as the attacks were principally confined to such wards as were most exposed to morbid influences.

At a very early period of the present epidemic, three cases occurred in the surgical wards upon patients who had undergone operations, and for whose recovery the best hopes were entertained. All these persons died; and it may be observed that in most cholera epidemics the first blows are always the most deadly. Indeed, so impressed were the medical officers with the perils connected with the ward in which these deaths had taken place, that measures were at once taken for the complete clearing of the same. These early patients had been treated on the saline and emetic plan.

The number of cases brought into the hospital after this first outbreak, as stated to us by Mr. Holderton, physician's assistant to the hospital, was not very considerable, these not amounting to twelve altogether. On the 16th of August there were five cases under treatment, the patients lying in wards especially set aside for them. They were all in a pretty satisfactory state, and likely to do well under a plan of treatment which will startle some of our readers.

Dr. George Johnson, who has the charge of the cholera wards, considers that the purging in cholera is mainly an effort of the organism to throw off the virulent principle which is at the root of the disease; he therefore in his treatment does his best to aid this eliminating process by gentle means, and gives ounce doses of castor oil every half-hour. Some of the patients thus treated were admitted either with severe purging and vomiting, or in the cold and blue stage. A mustard poultice was usually placed on the pit of the stomach, and the castor-oil given every half-hour until the action of the bowels was well established. Ammonia was tried with the oil, but it increased the sickness, which symptom was more effectually allayed by the oil alone. In every case considerable relief was obtained upon the bowels being freely moved, and the congestive fever, which sometimes carries off patients who have struggled through the original choleraic attack, was noticed, in Dr. Johnson's patients, to be very slight. External heat, by means of warm bottles, frictions, &c. &c., was also used, but we did not perceive that either brandy or opium were employed.

All the cases had presented the premonitory diarrhoea, and the more the epidemic is studied the more conspicuous it is becoming that diarrhoea always precedes an attack of cholera; hence the care that should be taken of preventing such attacks by arresting looseness of the bowels. A considerable number of applicants suffering from diarrhoea have been relieved in the out-patients' department of this hospital.

Is the increase of this latter complaint owing to the choleraic state of the atmosphere? Or do we see so many cases because more people apply at this period for slight looseness of bowels than in ordinary times? Both causes are perhaps concerned in the circumstance to which we are alluding.

## CHARING-CROSS HOSPITAL.

## CASES OF CHOLERA.

It will appear rather strange, to those who know the crowded state of the localities lying between the Strand and Holborn, that only one solitary case of Asiatic cholera was admitted into this hospital up to August 14th. The patient, a man about forty years of age, was brought in July 24th, at one o'clock in the afternoon, and died at seven in the evening.

Before his admission, as we were informed by Mr. Diamond, house-surgeon to the hospital, the man had had about twenty-five evacuations, looking like yeast; but he had none in the hospital. On the day before the attack, the patient had partaken of a meal of bread and cheese and cabbage; he had formerly been very intemperate, but had given up drinking some time, and was living near the banks of the river by the side of Scotland-yard.

At five in the morning the poor man had been taken ill, and when admitted into the hospital, eight hours afterwards, he was already blue, collapsed, and without pulse. Dr. Golding could of course not do much for him; but great exertions were made with external warmth, frictions, brandy, &c. &c., though to no purpose.

If the cases of cholera have been almost absent from this hospital, diarrhoea has, on the other hand, been extremely common, the applicants to the dispensary having been very numerous. The looseness of bowels was mostly treated by nitro-muriatic acid, in doses of one drachm and a half of the acid to two ounces and a half of water: a teaspoonful to be taken according to the symptoms. Sulphuric acid and opium have also been successful in checking diarrhoea.

## WESTMINSTER HOSPITAL.

## CASES OF CHOLERA.

This hospital has received, from the 1st of August to the 17th, a rather large number of cholera patients, there having been about thirty-two altogether. Of these, about twelve have died, and Mr. Wilson, the physician's assistant, stated to us that the cases admitted were mostly *bona fide* cases of Asiatic cholera.

Here again we find that the patients attacked by the epidemic have been placed in separate wards. On August 17th, there were seven cholera patients in the house, all in a very precarious condition, and who probably have since succumbed to the attack. The cases have been very severe, and many patients were brought in a hopeless condition. In examining the patients in the house, on August 17th, we could not help remarking the ever-constant type of this fearful disease; the sunken feature, the half-closed eye, the shrivelled and cold extremities, the icy breath, the peculiar listlessness so characteristic of cholera, cannot indeed for a moment be mistaken.

The line of treatment followed in this institution consists of drachm doses of dilute sulphuric acid, and also calomel and opium, in doses of five grains of the first, and one of the second. Restorative means are resorted to at the same time, but brandy is not so largely given as in some other hospitals.

The cases of diarrhoea amongst the out-patients have been extremely numerous, and the treatment by dilute sulphuric acid particularly successful. Mr. Wilson mentioned to us that on Sunday, August 13th, he had had to prescribe for almost one hundred cases of diarrhoea, Sunday being, besides, an unusual day for out-patients presenting themselves.

## SURREY DISPENSARY,

## BOROUGH OF SOUTHWARK.

We are informed by Dr. Willshire that, "from the institution being situated close to those districts of the metropolis where cholera has most abounded, the demands which have been made for drugs to allay gastro-intestinal irritation and discharges have been in truth excessive. A combination of the chalk mixture with the tincture of catechu and the tincture of ginger, has been the medicine usually administered in the ordinary cases of diarrhoea. Of the mixture in question no less than six gallons have been dispensed in a single day. To the above combination are added the tincture of opium and aromatic confection in more obstinate cases; while, in still more severe forms of choleraic diarrhoea, solid opium, either alone or in union with the acetate of lead and capsicum, is administered. Camphor and henbane, in pills, are also given

where there is much tormina. The dilute sulphuric acid has been tried, but although frequently appearing to hold for some time the intestinal discharges in restraint, has not impressed those of the medical officers who have used it with a very high opinion of its merits. The infusion of cinchona, combined with kino and camphor, have been administered apparently with much benefit to the younger patients."

At the Royal Infirmary for Children, hematoxylon and the nitrate of silver are employed in addition to the above agents, according to Dr. Willshire.

## STOKE-NEWINGTON DISPENSARY.

MR. JAMES reports that up to Thursday, the 17th inst., the medical officers had not been called upon to attend any case of genuine malignant cholera, although they have had to treat much simple cholera and a few cases of choleraic diarrhoea. The treatment of the latter consists in first administering the following draught:—Powdered rhubarb, a scruple; carbonate of magnesia, half a drachm; carbonate of ammonia, ten grains; tincture of opium, fifteen minims; peppermint-water, an ounce and a half; followed in two hours, if necessary, by the dilute sulphuric acid treatment, or the following mixture:—Carbonate of soda, aromatic spirit of ammonia, of each two drachms; tincture of opium, one drachm; cinnamon-water, eight ounces; of which an ounce is given every four hours. From this treatment the medical officers consider the most beneficial results have been derived during the present epidemic, they having in many cases been obliged to have recourse to it when the acid treatment has failed. In some cases, where the vomiting has been severe, they have resorted to the following pill, given every half-hour for the first three doses, and afterwards, if necessary, every four hours, but usually the first three doses have proved all that are requisite:—Calomel, one grain; opium, one-third of a grain; powdered capsicum, one grain. Mix.

## ISLINGTON DISPENSARY.

*Treatment for simple Diarrhoea.*—Chalk mixture, with small doses of tincture of opium, and with or without catechu; perhaps a pill of calomel and opium.

*Diarrhoea, with vomiting or cramps, serous purging, &c.*—Chiefly calomel and opium, with chalk mixture, ammonia, &c.

*Developed Cholera.*—Calomel, small doses, frequently repeated; no opium in any form, (Dr. Ayre's treatment.)

HOLLOWAY AND NORTH ISLINGTON DISPENSARY,  
2, LOWTHER COTTAGES, HOLLOWAY.

THE resident medical officer states that for young children the chalk mixture of the London Pharmacopœia, with the addition of bicarbonate of potash, or sesquicarbonate of soda, a scruple to a drachm and a half, and occasionally tincture of catechu, a drachm, has been found very advantageous, in doses of a teaspoonful every two, three, or four hours, preceded by a dose of mercury with chalk and compound ipecacuanha powder, of each a grain. In the case of some few aged people, the compound chalk mixture, made with compound chalk powder with opium, two scruples, cinnamon-water, eight ounces, and given in ounce doses, with the addition of compound spirit of ammonia, half a drachm; also, in obstinate cases, tincture of catechu, half a drachm, has answered well.

One of the honorary surgeons employs, frequently with success, the solution of acetate of ammonia, and aromatic spirit of ammonia. The others, and he himself, as he has stated, use the dilute sulphuric acid, from twenty to thirty minims, alone, or with small doses of opium. During the week ending August 16th, there had been treated seventy casual applicants suffering from diarrhoea of a more or less severe character, besides those that had obtained out-patients' letters. Not more than six of these have found it necessary to apply a second time; usually the second or third dose (sometimes the first) produces a marked improvement. There has been but one case of decided cholera.

## NORTHERN DISPENSARY,

## SOMERS-PLACE WEST, EUSTON-SQUARE.

DR. DOLTON informs us that there have been no cases of malignant cholera at the Northern Dispensary, but diarrhoea has been unusually prevalent. The majority of cases have yielded to the ordinary treatment of chalk mixture with opium, and others have been treated with gallic acid, or dilute sulphuric acid, and opium, assisted in most of the cases by alterative doses of mercury.

ST. PAUL AND ST. BARNABAS DISPENSARY,  
UPPER EBURY-STREET, PIMLICO.

MR. MOREY, the resident medical officer, informs us:—"We usually treat diarrhoea (of which we have had a great number of cases, and all recovered,) as follows:—A pill, containing one grain of calomel, and a quarter of a grain of opium, or two grains of calomel and half a grain of opium, to be taken directly; a mustard poultice to the abdomen; and, an hour after the pill, a draught, containing a scruple of aromatic confection in an ounce of cinnamon-water, to be repeated after each relaxation. Sometimes we give the chalk mixture instead.

"In six cases of choleraic diarrhoea the following treatment has been adopted, (four cases have recovered, and two are doing well.) The pill before named to be taken directly, and a mixture containing two drachms of dilute sulphuric acid to eight ounces of water, of which an ounce is given every two hours.

"Three cases of Asiatic cholera have occurred, all of which were preceded by diarrhoea, (neglected,) and not seen until in a state of collapse. Two of these were in children, one eight, the other five years old. During collapse small doses of calomel frequently repeated, and the acid mixture every half-hour during the consecutive fever, were given. The former had a mixture containing nitrate of potass and solution of acetate of ammonia, with an excess of ammonia. The patient died. The latter, during the consecutive fever, took five grains of chlorate of potass in half an ounce of water, every half-hour, and recovered. The former, during the collapse, had small quantities of port-wine occasionally. The latter had no stimulant whatever. A woman, aged fifty-seven, during collapse, took a pill containing one grain of calomel and a quarter grain of opium, every second hour; and the acid mixture, with the addition of compound spirit of sulphuric ether twenty minims every half hour. She recovered from the collapse, but died of the consecutive fever three days afterwards."

EASTERN DISPENSARY,  
GREAT ALIE-STREET, WHITECHAPEL.

MR. JOHN C. BARRY, resident medical officer, writes:—"Up to this date (August 18th) I have had no real case of Asiatic cholera presenting itself to my notice. However, obstinate and severe diarrhoea, frequently accompanied with cramps, coldness of extremities, and vomiting, (in fact the ordinary disease usually termed English cholera,) has been very prevalent in our district, the number of cases relieved since the 1st of August being 254.

"I have tried a great many formulae, but find none answer so well in arresting pain and relaxation as the mixture prescribed by Dr. Munk, physician to our institution, composed according to the printed instructions I have subjoined.

"Some few cases have come under my notice (the diarrhoea having been checked by this treatment) of coldness of extremities and pains of the stomach and bowels, in which I have been in the habit of prescribing the following—viz.: Sesquicarbonate of ammonia, five grains; tincture of opium, ten minims; camphor mixture, an ounce: mix for a draught, to be taken every four hours. I have also ordered a mustard cataplasm to the stomach and bowels, with bottles of hot water to the feet; and if the patient has felt inclined for any nourishment, I have ordered brandy and arrowroot at intervals.

"Should any cases of real Asiatic cholera come under my notice, I shall have great pleasure in forwarding an account of the symptoms, treatment, &c., for publication in THE LANCET.

"I beg to enclose the printed instructions directed by Dr. Munk to be issued with his mixture.

"*Medicine for Relaxation or Looseness of the Bowels.*—Dose for persons above fourteen years of age, three tablespoonfuls; dose for persons above seven and under fourteen years of age, two tablespoonfuls; dose for children above two and under seven years of age, one tablespoonful; dose for children under two years of age, two teaspoonfuls. A dose to be taken immediately, and repeated every two or three hours—until medical advice can be obtained.

"N.B.—For the information of such medical practitioners as may subsequently have to treat the case, it is here stated that the proportions and ingredients of the mixture are as follow:—

"Compound chalk mixture, eleven drachms; compound cinnamon powder, six grains; tincture of catechu, forty-five minims; tincture of opium, five minims. Mix."

(To be continued.)

ON THE  
MODUS OPERANDI OF MERCURY IN THE  
CURE OF ASIATIC CHOLERA.

By J. TAYLOR, Esq., L.S.A.

AFTER so many ephemeral productions have issued from the press on the nature and treatment of the epidemic cholera, it would seem almost superfluous in me to attempt anything further on the subject, more especially as the disease and its treatment have been investigated by such able minds in every part of the British dominions—in fact, in every part of the world where the dire pestilence has prevailed.

Nevertheless, having witnessed the two last epidemics in this metropolis on an extensive scale, I may be permitted to offer my mite, in addition to the observations of other writers; and having done this, if I shall have succeeded in bringing forth any new pathological fact which may tend hereafter to elucidate a point in the treatment of this disease, and enable us to handle our remedies with more confidence than we have hitherto done, and thus to reduce the heavy mortality by the preservation of only a few valuable lives, I shall indeed be gratified and amply rewarded.

It will be unnecessary here to investigate, with any degree of minuteness, the history and progress of cholera; its onward march in a northerly direction, from the shores of India along the great channels of human intercourse; its invasion of any country almost always at a seaport, attacking few people at first, and spreading thence in various directions; the comparative immunity from the disease of those places where the least communication is held with infected districts; and the remarkable fact, that wherever military cordons have been established in any country where cholera has prevailed, the disease has invariably made its way through every human barrier—military cordons being, in reality, the connecting links between one frontier and another. These facts, in my opinion, afford the strongest evidence that the disease, whatever may be its epidemic origin, is propagated by human intercourse, although the exact manner in which the *materies morbi* may be supposed to enter the system must, for the present, remain an open question. Nevertheless, there are strong grounds for believing that it is from the living, and not from the dead body, that the source of propagation is derived, and that the alimentary canal affords the materials. In support of this theory, numerous cases might be cited. One or two will suffice for the present occasion.

An intelligent and well-educated neighbour, an undertaker, informed me, during the prevalence of the epidemic cholera of 1832, that a number of men in his establishment, who were extensively employed from morning till night in burying the dead, were frequently compelled to carry without coffins the bodies of those who had died of cholera from an upper to a lower apartment, in consequence of the narrowness of the staircase not permitting a coffin to be carried up; yet, notwithstanding this daily exposure in the worst infected districts, not a man so employed was sick from cholera during the whole season.

Again, during the last epidemic of 1849, whilst the terror-stricken inhabitants of this district were witnessing with dismay the fearful ravages of the disease, a melancholy instance occurred, a few doors from my residence, which greatly tends to corroborate the plain and simple theory of Dr. Snow—viz., "That it is from the excretions of the alimentary canal being swallowed, or by some subtle process conveyed into the stomach and bowels," that the disease is propagated; but whether these *materies morbi* are to be regarded as inorganic or organic, in the shape of a nucleated cell or vesicle, is a question which is probably left for the microscopist to solve. I will relate the circumstance as it occurred.

A family consisted of husband, wife, son, and daughter: the first, for a few days during the early part of July, had suffered from diarrhoea, of which he, like many others, took but little notice; on the night of the fourth day he was seized with cholera of the worst kind, and died on the following day. At the same time the wife was seized, and on the following day she died also. Simultaneously the son and daughter were attacked; the son shared the same fate as his parents; the daughter, a little girl about ten years of age, was removed to another district, and recovered. The servant alone escaped, although she officiated as nurse to the whole of the family. The house in which this calamity occurred became deserted for about two years afterwards, and on the drains being examined, it was found that the privy had overflowed into the drain; from the drain the rats had made a communication into the well from which the water was supplied to the family for domestic

purposes. The frightful mortality which befel the inhabitants of Albion-terrace, Wandsworth-road, occurred shortly after this period, where the water became contaminated from a similar source, and above twenty of the inmates perished. I need say no more; those who think with me will no doubt conclude that this short history will in itself preclude the necessity for any further comment.

Having endeavoured to establish at least plausible reasons for belief in the communicability of cholera by means of human intercourse, and the source from which, for want of better evidence, such communicability may be supposed to emanate, I shall now proceed to consider the disease pathologically.

A writer\* on cholera, in 1832, says: "Reviewing the symptoms during life, and the appearance after death, it will be apparent that the stomach and small intestines form the primary seat of the disease."† This is manifestly true, and this local affection of the alimentary canal affords a sufficient explanation for all the consequent general symptoms. The precursory diarrhoea—frequently the harbinger of an attack of cholera—is attended with little or no disturbance of the general health. The daily meals are taken with the usual relish; the ordinary business duties are performed with the usual alacrity; the individual imagines, nay, often insists, that a moderate purging is doing him good. He is thus taken off his guard, and after partaking of a hearty supper, retires to rest, little thinking, perhaps, that he will be disturbed between twelve and two o'clock in the morning by that overwhelming deluge from the stomach and bowels, so truly characteristic of the malignant cholera.

The serum of the blood being thus drained off by the copious and frequent liquid and colourless evacuations from the bowels, by constant vomiting, and by transudation through the skin, the blood becomes thick and viscid, and can no longer circulate with its usual velocity; severe cramps attack the muscles of the abdomen and extremities, collapse ensues, the hands, feet, and lips assume a mahogany colour, and soon become blue or purple, the secretion of urine is suspended, the pulse ceases at the wrist, the patient becomes asphyxiated, and ultimately comatose; and if, by the aid of either remedial means or constitutional strength, he should survive this condition, and reaction take place, the case will frequently emerge into what has been properly termed consecutive fever; and at this stage of the disease, and at this stage only, shall we find evidence of a morbid poison having entered the system. The effete matters which it was the office of the kidneys to eliminate from the system have been retained and absorbed, the blood is poisoned thereby, and fever, coma, and death are the consequences.

This detail of the symptoms as they follow in succession, from the invasion of the disease in the stomach and bowels, to the final close in death, will naturally lead to the consideration of post-mortem appearances, which, in fact, are precisely such as might have been anticipated. The three great cavities of the body show what might, *a priori*, be considered as unequivocal marks of extreme venous congestion; and the mucous membrane of the intestines is found to be pulpy, soft, and thin, and in many instances as if it had been partly washed away.

The next and most important consideration will be the treatment. To those who draw hasty conclusions from appearances found on dissection, bloodletting would appear to be the appropriate remedy, although it is difficult to conceive how the abstraction of blood should enable that already thick and viscid fluid to circulate with greater facility. Yet Annesley, (p. 170,) states, in rather a serio-comic phrase, "That in nine cases out of ten it will prove successful, especially if the colour of the blood changes from black to red, if the pulse gets up, and the spasms be relieved." Jameson (p. 190) candidly says,—"In every case it was difficult to get any blood to flow, and when any was obtained, it had a thick, jet-black, oily appearance, and would scarcely flow to the extent of a spoonful in half-an-hour; and would entirely cease as the patient fell into a state of collapse."

This exactly agrees with my own experience, although I am ready to admit that bloodletting may have been of service in many cases of cholera, not indeed as a remedy for the actual cholera symptoms, but as a means of relieving actual congestion of some organ which had existed previously to the invasion of the disease, and this relief to chronic inflammation or congestion would certainly place the patient in a more favourable condition for recovery, and thus enhance the value of a remedy which at one time obtained a wide-spread reputation.

\* Pettigrew.

† Also Dr. Snow.

‡ It is necessary here to avoid confounding the "post hoc" with the "propter hoc." These post-mortem phenomena are probably owing to the abstraction of the serum of the blood, whereby the red particles subside in the vessels, and thus the appearance of congestion is produced.

Of medicines, the whole materia medica has been ransacked; earth, air, and water have been called in to our aid; the animal, vegetable, and mineral kingdoms have also done their part; every means that science and humanity could dictate, from the do-nothing method of a few grains of charcoal, to the heroic practice of scruple doses of calomel, (and even transfusion,) have been tried, and each in its turn has been stated to have been successful. Not forgetting our old departed auxiliaries, musk, phosphorus, and cajuput oil, and the saline treatment; hot and cold water, *cum multis aliis*; I have tried them all, and with variable success. I may here remark that, in the epidemic of 1832, phosphorus was vaunted as a most potent and valuable remedy; in two cases where it was administered the patients became furiously maniacal, and they both died. It is, however, to Dr. Ayre, of Hull, that the medical profession is indebted for the scientific administration of mercury in Asiatic cholera, and my experience enables me to confirm its superiority far above any other remedy which has hitherto been recommended, my principal object in writing this paper being to point out the manner in which mercury produces its curative effects in this intractable disease. These opinions, it is true, may require the test of time to prove their truth or fallacy; but whatever may be the result, I can faithfully assert that they are reasonings from facts collected at the bedside, and are not the result of mere arm-chair lucubrations.

About the end of July and beginning of August, 1849, one or two circumstances occurred under my notice, beautifully illustrative of the proposition advanced by Sydenham, viz., "Whatever disease a person may be labouring under, during the prevalence of any epidemic, that disease will in some measure partake of the nature of the said epidemic."

I had encountered about this time a few cases of dysentery, but in so modified a form that the mucus discharge from the bowels, instead of exhibiting the usual colour, had the appearance and consistence of cream or blanc-mange. These cases all recovered. Other cases followed; and notwithstanding that they all occurred in cholera districts, not a single case passed into this disease. I was not long in observing that this modified dysentery was the salvation of my patients; that it was, in fact, antagonistic to the cholera. From this I was led to infer that if a remedy could be found capable of producing a dysenteric condition of the alimentary canal, we should so far have established a principle in the treatment of a disease which had hitherto been little better than empirical. (I beg it to be understood here that what is meant by a dysenteric condition is a *bona fide* subacute muco-enteritis.) The well-known effect of mercury on the bowels, its remarkable success in the hands of those who had administered it with undeviating perseverance, coupled with what I had observed in my own practice, served but to enhance its established superiority, and to afford a ready explanation of its *modus operandi*—viz., that by artificially inducing a subacute form of muco-enteritis, the superabundant discharge of serum is arrested, and an antagonizing barrier established to the further progress of the disease. It is highly probable that the reputation which tartarized antimony and iodine at one time enjoyed was due to a similarity of effect on mucous surfaces.

The mineral acids, of which the celebrated Austrian remedy is composed, probably produce their beneficial effects in the same manner. The method which I have pursued in administering mercury has not been dissimilar to that recommended by Dr. Ayre—viz., a grain of calomel\* every ten minutes, washed down with a little fresh cold spring water, drawn from a pure source. The bichloride has also been used in the form of injection; one grain, dissolved in eight ounces of distilled water, thrown up twice or thrice in the twenty-four hours. And as a substitute for the loss which the system had sustained, the following mixture was invariably prescribed in collapsed cases, to be taken with the mercury:—Chlorate of soda, phosphate of soda, of each half a drachm; spirit of nitric ether, one drachm; spring water, eight ounces: half a wineglassful to be taken every hour. These measures, assiduously applied by a good nurse, have certainly rescued many from impending death; and in almost all the successful cases recovery has been preceded by a mucus evacuation, frequently tinged with green, and this I have denominated the "mercurial stool," which, when once established, was generally indicative of a favourable termination.† The mercurial stool, then, having

\* The quantity of calomel administered in recovered cases varied from two to six drachms; the latter quantity was certainly the maximum, and only occurred in one instance, where the patient persisted in taking the pills without my knowledge until the second day after reaction had taken place. This was the only case of severe pyramism that occurred.

† The only fatal drawback to this or any other plan of treatment being, that the patient will frequently succumb to the disease before the best directed remedies can produce their beneficial effects.

fairly made its appearance, the mercury may be gradually withdrawn; and should consecutive fever follow, it must be combated by ordinary principles, according to the circumstances of the case. I have never found it of the least avail to torment the patient by friction with anodyne or stimulating liniments, for the relief of those severe cramps of the extremities, being fully satisfied they only interfere with that bodily tranquillity so essential to the patient's recovery.

I shall now conclude by recording my observations on opium, concerning which so much has been said and written. Its use appears to me to be limited to the precursory diarrhoea, and to the primary symptoms of cholera during the early stage of vomiting and purging, with excessive cramps, when the fingers have become shrunk and shrivelled, like those of a washerwoman, and before the hands and feet have assumed the mahogany, or blue colour; in short, before extreme collapse has set in, opium may be administered freely, and with the happiest effects. From one to two grains, with the same of mercurial pill, for the first dose, and half the quantity of each every hour, for three successive doses, together with the before-mentioned saline mixture, and in some cases with the common chalk mixture, without any adjunct, (as this in many instances seemed to nauseate the stomach,) assisted by a large sinapism to the epigastrium and abdomen, have frequently acted severally most beneficially, and restored the patient to comparative convalescence in the course of a few hours.

Whilst finishing this paper, I have been put completely *hors de combat* by the observation of my respected anatomical teacher, R. D. Grainger, Esq., who, on his late visit to the Wolverhampton Union, gave it as his opinion, "That there was no remedy for developed cholera." My opinion, however, is at variance with Mr. Grainger's assertion; but quite in accordance with the observation of Dr. Ayre, that mercury approaches as nearly to the character of a specific in cholera as quinine in intermittents. And the prevalence of the disease at present, as an epidemic, has again afforded me an opportunity of further testing its efficacy. The result of the treatment in nine cases (two deaths) of algid cholera, six of them quite collapsed and pulseless, has been such as greatly to increase my confidence in the mercurial treatment, and, at the same time, to surmount some of the difficulties in the way of its administration. The objections of children to the frequent repetition of powders, and the irksome task to Madam Nurse of mixing them and keeping to time, have been superseded by the following formula:—Mercurial pill, half a drachm; purified sugar, half a drachm; sesquicarbonate of soda, two scruples; powdered gum Arabic, two drachms and a half; tincture of opium, ten drops; pure water sufficient to make three ounces: take half a teaspoonful every quarter of an hour, or every twenty minutes. This medicine, like everything else, will be rejected by the stomach for several doses, but my motto has been, "*Spero et persevero*," and I have not often been disappointed.

Having now thrown my mite into the scale in the cause of suffering humanity, those who have laboured with me in the same field will be best able to appreciate my exertions. "*Etenim omnes artes, quæ ad humanitatem pertinent, habent quoddam commune vinculum et quasi cognatione quâdam inter se continentur.*"—*Ciceronis Oratio pro Archia Poeta*, p. 193.

Surrey-place, Old Kent-road, 1864.

## NOTE ON THE PROVISIONING OF ARMIES,

IN RELATION TO THE

PRESENT STATE OF OUR ARMY IN THE EAST.

By R. M. GLOVER, M.D., F.R.S.E.

GREAT complaints have been made of the insufficient supply of food to our army in the East, caused, it is said, in great part, by the want of transport. I am surprised that the attention of our military authorities has not been called to the great value of extract of meat, in such cases, both from its portability and its nutritive powers. There is no difficulty in preparing and preserving this substance, which affords, in very small comparative bulk, all the properties of the meat whence it is derived. Two or three ounces of it will make a pint and a half of excellent soup, which, with a ration of bread and some condiments, would make no bad meal for a soldier, when beef or mutton was not to be got; and for the sick its use would be invaluable. It must be altogether distinguished from the more bulky preserved meats, being, in fact, a watery extract, containing the quintessence of the nutritive powers of the meat. But the great value of this substance is its portability, containing as it does, or at least as there is every

reason to think, the alimentary power of at least five or six times as much meat. Expense in such case should be no object, as the extract should be kept in reserve for emergencies.

I called attention to this subject in an article of mine in a literary review some time ago. Liebig, I believe, originally made a proposition of the kind. On the plains of Buenos Ayres, where vast herds of cattle are slaughtered merely for the hides and tallow, might not a manufactory of this valuable substance be established? while the refuse of the animals could be turned into artificial guano and numerous chemical products.

I hope some of the medical officers who have interest with the Horse Guards may see this, and consider the proposition, for I cannot but think the matter of importance to the public service at the present time. If a large quantity of extract of meat had been sent out with the army of the East, much misery might have been prevented; perhaps events of national moment might ere this have been achieved. I may add that it may be questioned whether the expense of the article might not be, to a great extent, made up by the facility of transport.

August, 1865.

## CLINICAL AND CRITICAL CONTRIBUTIONS TO OBSTETRIC SCIENCE AND PRACTICE.

By ROBERT BARNES, M.D. Lond.,

MEMBER OF THE ROYAL COLLEGE OF PHYSICIANS, PHYSICIAN-ACCOCHEUR TO THE WESTERN GENERAL DISPENSARY, PHYSICIAN TO THE METROPOLITAN FREE HOSPITAL, LECTURER ON MIDWIFERY, ETC.

### APPENDIX TO A MEMOIR ON UTERINE POLYPUS: ITS NATURE, EARLY DETECTION, AND TREATMENT.

A CASE OF INTRA-UTERINE POLYPUS, UNDISCOVERED DURING LIFE, CAUSING HÆMORRHAGE AND DEATH.

CASE 9.—Since my memoir "*On Uterine Polypus*" has been published, a case has occurred, offering a striking demonstration of the value of the rule in practice I ventured to enforce. I think it will be impossible to peruse the following facts without being struck with the conclusion, that a timely diagnosis of the nature of the case, and surgical intervention, might have rescued the patient.

In the night of the 3rd of August, my colleague, Dr. Ramskill, was called to see a young woman who was suffering from uterine hæmorrhage. The history of the case is briefly this: the patient was twenty-six years of age; she began to menstruate at the age of fourteen, and this function was performed very regularly until her marriage, eight months ago. From that time she has suffered almost perpetual hæmorrhage. A month ago, the flooding was so profuse that it was thought she had miscarried. Since then there have been slight occasional intermissions, but her health was deeply impaired. When Dr. Ramskill was called the hæmorrhage had returned. He observed strong bearing-down, expulsive efforts. The patient died the same night in convulsions, evidently from loss of blood.

The body was examined by Dr. Ramskill on the following day. The organs were all healthy. There was no abdominal inflammation. The os uteri was healthy, but flaccid; it was filled with a fresh clot. There was also blood in the cavity of the uterus. The larger portion of the uterus, with a body adhering to the inner wall, was forwarded to me by Dr. Ramskill.

I subjected the parts to a careful examination. The walls of the uterus were dense, pale, somewhat thicker than natural, and the whole size of the organ somewhat larger than the normal unimpregnated womb. There was no tumour or other abnormal condition of the muscular wall, but attached to the inner surface near the fundus, and altogether enclosed within the cavity of the uterus, was a tumour of the size of a small walnut. The tumour did not reach to the uterine neck. The mucous membrane of the cavity was stretched over it. It was connected by a broad basis to the uterus, but would have admitted of isolation by ligature. The apex, or most projecting part, had undergone partial disintegration; it was a little broken up, softened, and had evidently quite recently been the source of hæmorrhage. Examined by the aid of the microscope, the substance was found to consist of nucleated fibres, the nuclei being large and distinct. Portions, especially those taken from near the apex, exhibited abundance of oily globules and numerous blood-globules. The structure of the tumour differed from that of the uterine wall in this respect only, that

the fibres in the latter were longer, narrower, and more densely interwoven, and the nuclei less distinct. There was no evidence of fatty degeneration in the fibres of the uterine wall. There was no doubt greater developmental activity in the tumour than in the uterus.

The practical deductions from this case are of the highest interest and importance:

1. The condition of the uterine muscular walls leads me to conclude that the conjecture that the patient had aborted a month before her death was erroneous.

2. The comparative indolence of the tumour, and the absence of any remarkable amount of hæmorrhage up to the period of marriage, and the constant floodings following immediately upon that event and continuing until the death of the patient eight months afterwards, forcibly illustrate the influence of ovarian and uterine stimulation in developing the growth of uterine polypi.

3. The case is peculiarly one of that class to which I have pointed as strongly indicating the necessity of exploration beyond the os uteri. In this instance the os uteri was found healthy; there was no obvious sign of local disease to explain the hæmorrhage; the bulk and weight of the uterus were rather above the normal standard; the figure of the organ was regular. Everything pointed to the uterine cavity as the seat of the cause of the hæmorrhage. It is, in short, the type of the class of cases in which the dilatation of the uterine neck is indicated.

4. The operative proceeding which in my opinion would have been the means of rescuing this poor woman from bleeding to death, is the following: repeated doses of ergot of rye, and the application of galvanism to aid the natural efforts of the uterus to effect the scission and expulsion of the tumour; and the dilatation of the uterine neck by sponge tents. By these means combined, no long period would have elapsed before the tumour would have been brought into view. If it had been then found difficult to encircle the neck of the tumour with a ligature, the operation might have been facilitated by bringing the tumour lower down by the aid of a tenaculum. In the present case, I believe the tumour admitted of being so removed. But we may imagine a case where ablation would not have been expedient or possible. In such a case, the local application of the acid nitrate of mercury, *potaassa fusa*, or the actual cautery might have been justifiably resorted to in order to arrest a hæmorrhage that was fast hurrying the patient to the grave. Such an application might also cause the destruction of the tumour by disintegration or degeneration.

5. The softening and partial breaking up of the tumour observed after death suggests to me that the microscopical examination of the discharges might have detected some of the constituent nucleated fibres of the tumour, and have aided the diagnosis.

6. I would finally remark, in answer to those who deprecate any operative interference with polypi that have not yet made themselves visible at or below the os uteri, that the intervention of surgical aid is not indicated by the mere position of the polypus, which is altogether unimportant, but by the terrible attendant hæmorrhage, no matter where the polypus may be. If this be so, and surely the proposition cannot be disputed, then it follows that the removal of an intra-uterine polypus may be as urgently called for as the removal of one that has descended into the vagina.

In the case of an abortion, or of the retention of a portion of placenta, no obstetric practitioner is ever satisfied as to his patient's safety until the offending substance is removed from the uterus. Why should the patient be abandoned when the offending substance is a polypus?

Devonshire-square, August, 1854.

## MEMORANDA RELATIVE TO SOME CEREBRAL AFFECTIONS OF CHILDREN.

By W. HUGHES WILLSHIRE, M.D. Edin.,

PHYSICIAN TO THE ROYAL INFIRMARY FOR CHILDREN, &c.

(Continued from p. 95, vol. i. 1854.)

### No. VI.

*Meningeal Tuberculosis and Rachitis.*—E. G.—, a little girl, one year and eleven months old, was brought to the infirmary in March, 1854. "Her parents live in a street running off from the Waterloo-road, and inhabit the kitchens below the level of the ground, adjacent to a narrow, damp, dark area. In other respects, the child is well cared for, but is of a fair

strumous look, and has rachitis of the lower extremities." The symptoms presented by the patient for twenty days were those of "simple remittent fever." In the third week, a little torpor was observed, when suddenly shrill screaming came on, and was followed by severe and prolonged convulsions. The child died within twenty-four hours after the superintention of the screaming. It was believed that "water-stroke" (vide *THE LANCET*, vol. ii., 1853, p. 349) had occurred, but it was not so. At the post-mortem examination, scarcely any effusion was found in the ventricles, nor exudation at the base; but abundance of opaque, whitish effusion on the hemispheric convexities, and also marked granular exudation. On examining the lungs, both grey and yellow tubercular deposits existed, concrete masses of the latter, as large as a nut, being found. The point upon which stress may be laid is the sequence of bad hygiene, rickets, tuberculosis, pyrexia, and the fatal granular meningitis.

H. C.—, a little boy, aged one year and six months, whose parents lived in a confined, sunken, damp place in Broadwall, was brought to the Infirmary in the month of May. The child had slight rachitis of the lower extremities and of the wrist-joints, and consumption was said "to be in the family." There was no difficulty, from the symptoms, in at once diagnosing *granular meningitis*, which ran a course of sixteen days, during which no particular symptom was very marked, but all the ordinary ones existed in a modified or moderate degree. On a post-mortem examination with Mr. Beasley, the surface of the arachnoid was found very dry—drier than I had ever observed it before in this disorder. Beneath, on the hemispheric convexities, distinct granular exudation existed, and the ventricles were full of fluid, distended the length of the brain, which was very soft, as was likewise the cerebellum. At the base, some greenish-coloured, sero-albuminous-looking exudation was present, but not in the concrete form. On examining the chest, tuberculous deposit was found in the bronchial glands, and some few yellow, cheesy masses in the pulmonary parenchyma; but the point of chief interest was the very marked illustration of intra-serous grey granulation of the pleura which was presented to our notice. It may be observed that the child seemed to rally for a few hours under the stimulus of the effects of a blister to the vertex, and the after-application of the savine ointment.

The above cases of cerebral disease are recorded chiefly to show the complication of tuberculosis with rachitis, an union deemed by some to be exceedingly rare. Had the tuberculosis been confined to the meninges, exception might have been taken to the value of the cases, as illustrative of the complication in question; but since in both instances tubercular deposit was present in the thoracic organs, the cases must be allowed to stand. The following extract from the late edition of M. Bouchut's work ("*Des Maladies des Nouveaux-nés*," &c.) will indicate the light in which the point before us is regarded by some:—

"If rachitism has no affinity with the greater number of the more frequent diseases of children, it has, on the other hand, a sort of repulsion for several of them. Thus, between rachitis and pulmonary or mesenteric tuberculosis may be established the same law of antagonism that M. Boudin has sought to uphold as existing between intermittent fever and these same affections. A similar observation has been made by M. Guersant, in his article on 'Rachitism,' and its exactitude has been proved by the researches of M. Ruzf, who met with, at the hospital, but a very small number of tuberculous subjects amongst the children affected with rachitic degeneration of the bones; while, on the other hand, the tuberculous affection existed in two-thirds of the children dying from other causes."

These opinions are not participated in by others, or in but a modified degree. Thus Bednär remarks, (*Krankheiten d. Neugebren. &c.*, th. iv. p. 255,) that whilst he has never observed rachitis in tuberculous children in the first year of life, he has not rarely met with the union in the second; and Hauner (*Journal of Kinderkrankheiten*, b. xviii.) states, that although rachitis does not exclude (as some eminent practitioners maintain) pulmonary tuberculosis, yet it is worthy of remembrance, that whilst in very warm countries the rickets is a disease scarcely known by name, tuberculosis is there indigenous. According to Dr. A. Vogel, (*Journal of Kinderkrankheiten*, b. xx.) there is neither connexion nor antagonism between the diathetic maladies *sub judice*, but perfect indifference. In full opposition, however, to the views of Ruzf, Bouchut, and Guersant, stands M. Hervieux, who has so often (one in three) verified the coincidence of rachitism and tuberculosis in the youngest children, as to cause him to look upon the presence of the former as an important symptom of tubercularization before three years of age. In the concluding volume

(just published) of the classical work of MM. Rilliet and Barthez, (*Traité Clinique et Pratique des Maladies des Enfants*), the following remarks, amongst others relative to the point before us, occur:—

"We do not regard rachitism as one of the symptoms of tuberculization, but we may here observe, that we have already noted the not unfrequent coincidence of tubercles and rachitism in the youngest children."....."If the opinion of M. Hervieux were exact, there would be no great advantage in distinguishing between the two diseases; but we are not so persuaded, as is this physician, that rachitis is a sign of tuberculization in early infancy. Our observations, indeed, made in *private* practice, completely contradict such an opinion, and we maintain the importance of separating these two affections, whose prognosis is entirely different, at the same time endeavouring to recognise that which appertains to the one or the other in the complex morbid conditions which may result from their association."

As to the antagonism between rachitis and tuberculosis, the writer is not the least inclined to believe in it; nor is he of opinion that the former is even a probable sign of the latter. The opinion of Dr. Vogel, before alluded to, seems to be nearer the mark.

In connexion with the case of E. G.—, an interesting question is opened on inquiry as to the import and cause of the pyrexial disturbance which, for twenty days, attracted chief attention. It is freely admitted that the little patient was assumed to be suffering idiopathic fever, and it was known that rachitis was present. It falls, however, it may be remarked, to the lot of some *always* to be able to distinguish between idiopathic or other fever, and the pyrexial prodromata of "acute hydrocephalus." I wish I could do so.\* Was the fever here present that attendant on exacerbation of the rachitism, in other words, the fever of rachitis, in whose course sudden cerebral mischief of a secondary character arose? or was it that coinciding with general acute tuberculosis, in the course of which meningial deposit suddenly ensued? or was it really not immediately associated either with the rachitis or with the general tubercular deposit, but rather to be viewed as the essential prodromata of the gradual meningial lesion? It may be thought such analysis is inadmissible; but, as say MM. Rilliet and Barthez, "In the course of the first and second years of life the diagnosis offers the most serious difficulties, and that for many reasons. In the first place, the comparative rarity of the malady misleads the attention of the observer from suspecting meningitis; and further, the prodromata are far less distinct, and may be simulated by several affections, and in particular by rachitism, or even by the results of a simple fault in hygiene;" and again, "If a meningitis is developed in a tuberculous subject who has been ill for a year or more, we do not dream of saying that the symptoms of the tuberculization are the result of chronic inflammation of the meninges; why then, when the phthisis has a shorter duration, and is represented by prodromata, of one, two, and three months, admit that the morbid phenomena are due to chronic meningitis?" Upon further points in relation to the present subject, the third volume of the important work I have quoted from may be referred to, (p. 477, *et seq.*) In connexion with the second case, it may be observed that the deposit of grey granulations within the cavity of the pleura is a circumstance of rare occurrence. The last-mentioned authors are of this opinion, and Bednár, (*op. cit.*, t. iii., p. 107,) though he has met with it as early as five months, remarks, relative to the pleura, that "here it is much rarer than in other organs."

## GENERAL OBSERVATIONS ON EMPHYSEMA.

By CHAS. EDWARDS, M.D., F.R.C.S., Cheltenham.

Cases of emphysema occur, though very rarely, which may be designated, true, general, idiopathic.

1st. *True*, as opposed to artificial inflations of the cellular tissue, sometimes practised; and to the pulmonary species, the "vesicular" misnamed "true," and which consists merely in over-distension of the pulmonary vesicles—the term emphysema being pathologically inapplicable to tissues always normally *εμφυσήματα*.

2ndly. *General*, as extending over all the body, and so differing from all partial emphysemata—e. g., those of typhoid fevers—the gangrenous, scorbutic, spontaneous, &c.

3rdly. *Idiopathic*, as the antithetical class, the traumatic necessarily implies a *ρραυμα*; and therefore I would hesitate to

refer to this class, as Dr. Townsend (see "Encyclopædia of Practical Medicine") seems to have done, any cases devoid of that essential difference.

A class more properly allied to the traumatic may be represented by cases such as that of Louis, from a foreign body in the windpipe; also those possibly arising from the bursting of a vomica: the diagnosis being easily derivable from the history of the cases, and in the latter also from the starting point of the emphysema; the air in the case of vomica, in consequence of adhesion of its edges to the inner surface of the chest, having escaped into the cellular membrane outside the chest at the site of mischief. Similar observations may be made of abdominal cutaneous emphysema, originating in inflation from the intestinal canal. (See O'Ferrall, in *Dublin Hospital Gazette*, on Perforated Intestine, &c.)

Of cases, then, excluding *all violence ab externo*, and such as I have named true, general, and idiopathic, the only assignable commencement is rupture of the pulmonary air-cells, the investing pleura remaining uninjured; the extravasated air passes from one interlobular partition to another till it reaches the root of the lungs, mediastinum, and neck; and, to take up at this point my case of illustration, it appears over the clavicle a light, colourless, elastic, crepitant tumour, thence spreading through all the cellular tissues of the face and trunk—in fact, an extension of the emphysema, named "interlobular."

And here it may be opportune to examine briefly a few objections made to this theory of causation, viz.:—

1st. That in these interlobular aërial infiltrations no rupture of the air-cells has ever been detected.

2ndly. That such ruptures of several continually take place without the air finding its way into the above partitions.

3rdly. That these may even be lacerated without producing the emphysema of the cellular partitions. (See "Encyclopædia of Practical Medicine.")

Still I would reply, that the first objection may be answered by the difficulties of the dissection; and the remaining two barely establish it as a rare result, which is less than it truly is—namely, a rare affection. Now, a rare affection, possibly derivable from several causes, must, *a fortiori*, be truly a rare result of any one "continually taking place." Thus the rarity merely, not the sequence itself, is affected by the objection.

A word farther back in the theory of causation, and as to the state of the vesicles prior to their rupture,—one at first sight would imagine this a state of extreme dilatation; yet it has been said that interlobular emphysema is seldom combined with the vesicular, (the true (?) pulmonary of Laennec.)

If this be a fact, I would possibly explain it by supposing a general dilatation ("the vesicular") to bear off extreme aërial pressure from any one point, and so prevent rupture; and, *vice versa*, cases of partial aërial effusion from ruptured air-cells might obviate a more aggressive distension of the neighbouring pulmonary vesicular structure, the accidental occurrence of either species thus tending to counteract the other.

But if disposed to dispute the position, and to reckon Laennec's vesicular an antecedent of the interlobular, I would argue,—

Firstly.—That, despite the contrast of the former being common, the latter rare, the former slow and the latter sudden, still a sudden rupture may, notwithstanding its rarity, be yet a true sequence of a slow and common distension.

Secondly.—The latter perhaps existing, the case, by lack of opportunity, or omission, may not have been examined prior to such rupture, and the extreme rarity of such a consequent will further effect rarity of opportunity of redeemingly examining its antecedent, once unhappily overlooked.

Thirdly.—There are cases of the vesicular, where several air-cells are, by rupture, thrown into one large bulla. Here the crepitant râles, a *grosses bulles*, and the friction of ascent and descent, are common also to the interlobular, in other words, what we may conceive to be the transition state has auscultatory physical signs in common. Add to the difficulties of diagnosis that belonging to the auscultatory signs themselves; some, as Dr. Watson, doubting the existence of *dry* large crepitation; others, with Dr. Marshall Hall, considering the inconstant crepitus to "differ from that of pneumonia by communicating the idea of *dryness*." *En passant*, surely a crepitus may possibly be *dry*; although under different circumstances, listen to that of external emphysema itself—is it moist?

Fourthly.—The subject of the case subjoined, about twelve months prior to the attack of emphysema, suffered most severely from pertussis, and so most probably, although I had not an opportunity of examining, was left with overstretched air-cells. What more likely?

I now very cursorily append a sketch of a case, which it is the less necessary to describe minutely, as I furnish a photographic portrait of the same, obligingly taken, as the child lay

\* "Il y a des cas tellement simples que l'élève le moins instruit peut les reconnaître à première vue; il y en a d'autres tellement compliqués qu'ils mettent en défaut toute la sagacité du maître le plus habile." (MM. Rilliet et Barthez, *Op. cit.* t. iii., p. 592.)

in bed, by Mr. Ruck, of this town. I regret not having been able to obtain this prior to reducing a more enormous aërial distension by numerous lancet-punctures.

The case is that of Clara E—, aged three years, who had, as before stated, some twelve months ago, suffered most severely with pertussis, and in the present illness was first seen by me, March 15th, with the ordinary symptoms of subacute bronchitis.

March 19th.—A swelling first appeared over the right clavicle, whence it extended principally over the right side of the neck and chin, thence upwards to the left cheek and eye, which latter was quite closed on the evening of the 20th; then to the forehead and right eye.

21st.—Both eyes closed; partial ectropium; enormous distension of the whole trunk, especially the abdomen, which bulges out laterally, and the lumbar region. Respiration now extremely difficult, with interrupting catches, and thus difficult to reckon; pulse about 160; the face generally cold, but occasionally flushed in parts, or patches, which at first I attributed to irritation from contact of an embrocation with the lancet-punctures, till I discovered the alternation of flush and pallor. Stethoscopically, large crepitus, certainly conveying the idea of dryness; friction sounds, especially of descent; and compensating respiration in the left lung. The little patient is perfectly sensible; grasps an orange in each hand, as she was found by the artist, and is depicted in the portrait.

By means directed to calm the violent respiratory efforts, cough, &c., aided externally by a blister on the chest, (which is seen in the portrait much puffed out with air,) by numerous and repeated lancet-punctures, and a stimulant embrocation over the whole trunk, the cough and emphysema began to decline at about the fifth day of the latter, (as in Traumatic Cases, see Vincent.) Next the child began to take nourishment better, could be carried about the room, and in a day or two was so far convalescent as to be taken down stairs to meals; finally, the parents thought my further attendance unnecessary.

April 10th.—When I had just thought of calling to obtain a portrait of health to place in contrast with that of emphysema, and after nearly a fortnight's convalescence from the latter, I was summoned to revisit the little patient: acute bronchitis had unhappily returned, and, despite of every effort, the child sank on the 14th of April.

Grosvenor-street, Cheltenham, 1854.

## Reviews and Notices of Books.

*On Some of the Diseases of Women admitting of Surgical Treatment.* By ISAAC BAKER BROWN, F.R.C.S., Surgeon-Accoucheur to St. Mary's Hospital. Churchill. 1854.

There are three qualities which, in addition to accurate and extensive anatomical and pathological knowledge, are, in our opinion, essential elements in the constitution of a surgeon, in order to fit him to carry the practice of his art beyond the boundary of routine. These are: the spirit of enterprise; mechanical dexterity and ingenuity; and perseverance. An attentive perusal of the work before us, aided by a personal knowledge of some of the facts referred to, enables us to say, that the author has proved that he possesses the qualities we have named to a meritorious degree. Most of the subjects treated of in this work have already been brought under the notice of the profession by the author. We need not therefore enter

upon a detailed analysis upon this occasion. By far the most valuable chapter in the book is that on Ruptured Perineum. It is in the treatment of this distressing accident, which has long held a prominent place amongst the opprobria of surgery, that Mr. Brown has, in our opinion, shown the greatest amount of originality, and in which his efforts have been rewarded with the greatest success. The great feature of Mr. Brown's proceeding for the restoration of the ruptured perineum is the preliminary division of the sphincter muscle, on either side, so as to secure perfect freedom from muscular tension upon the wound. Although the principle of removing the disturbing influence of the sphincter has long been recognised as one necessary to be followed in those operations upon the rectum in which quiescence is indicated, it appears to us that Mr. Brown is entitled to the merit of originality in applying it as he has done to the operation for restoring the perineum. We say this, notwithstanding that Mr. Hilton, in conjunction with Dr. Lever, divided the sphincter for the relief of two cases of ruptured perineum, in 1848—that is, at a date anterior to the first operation of Mr. Brown. These cases have only been published recently, and there is no reason to suppose that Mr. Brown derived his idea from them. It does not, indeed, seem unreasonable to conjecture that the real importance of these cases was not fully appreciated by Dr. Lever until after the successful experience of Mr. Brown was made public.

The value of Dr. Lever's cases we consider to be great. They demonstrate, in a manner which Mr. Brown's operations do not, the essential and absolute importance of the division of the sphincter, apart from any other proceeding. Mr. Hilton's operation consisted simply in dividing the coccygeal attachments of both the sphincter and levatores ani from the sides and end of the coccyx by a subcutaneous incision. The effect of this operation was to permit the approximation of the divided parts of the perineum, and their retraction forwards and upwards into the pelvis, so as to support the pelvic organs. That the mere division of the sphincter, as described, without any attempt at restoring the floor of the pelvis, should be attended with such relief as is reported to have been obtained in the two cases of Dr. Lever, we regard as the most conclusive proof of the essential value of the proceeding. Mr. Brown, however, makes the division of the sphincter a subsidiary measure. He carries his operation further, and aims at the complete restoration of the perineum to its original integrity, the division of the sphincter being performed in order to promote the fulfilment of that end. In this we think he does wisely. We would, however, draw attention to what we consider a defect in his mode of dividing the sphincter. His proceeding is unnecessarily severe. It consists in introducing a blunt-pointed, straight bistoury within the margin of the anus, and dividing all the structures, including the skin, by two incisions, one on either side. We think the method of Mr. Hilton preferable, and, on referring to the discussion on Mr. Brown's paper at the London Medical Society, in January, 1853, we observe that Dr. Barnes then advocated the subcutaneous incision, stating that he had seen it practised with great success by the late Professor Blandin, in 1843. We are also of opinion that Mr. Brown's operation might be still further improved by substituting Mr. Brooke's bead-suture for the quills. According to our experience, the beads effect and maintain a far more accurate and secure apposition of the two sides of the perineum.

We cannot assent unreservedly to another proposition upon which Mr. Brown lays great stress—namely, the propriety of securing absolute constipation of the bowels for many days after the operation, by means of large doses of opium often repeated. We think he carries this notion too far. Indeed, we find, as we expected to find—for his cases are related with the most praiseworthy candour—evidence in Mr. Brown's own book to show that this plan is sometimes followed by injurious effects. At page 82, a case is related in which it is evident that the patient's cough was aggravated, and fever induced, by the too free use of opium. We are sure that a severe cough,

independently of other considerations, is more likely to mar the reparative process in the perineum than moderate action of the bowels. At page 84 is another case in which the administration of opium was followed by great irritability of the stomach, repeated vomiting, and prostration. Vomiting, like coughing, is especially to be averted. Sometimes, too, opium will produce diarrhoea instead of constipation. To say the least, Mr. Brown, in his great anxiety to secure inaction of the rectum, runs some risk, while escaping Scylla, of falling into Charybdis. Mr. Brown may, it is true, appeal to the great success which has attended his mode of operating and subsequent treatment. We are not insensible to the force of this ultimate reason, but we think it not the less important that every means that can be reasonably expected to add to the security and increase the prospect of success in future operations should be adopted.

In the remaining chapters we find less matter for discussion. Prolapse of the vagina and of the uterus are treated by Mr. Brown on principles similar to those recommended for ruptured perinaeum. Upon vesico-vaginal and recto-vaginal fistula the author does not advance much that is new. The same may be said of the chapter on polypus of the uterus, which we consider an imperfect one. Stone in the bladder, vascular tumours of the meatus urinarius, imperforate hymen, and encysted tumour of the labia, each form the subject of a distinct chapter. A chapter on diseases of the rectum resulting from certain conditions of the uterus, may be read with profit. The concluding chapter on ovarian dropsy is the most elaborate in the book. It deserves especial notice as containing a careful and instructive history of the disease. The author advocates the operation of Le Dran. But this disease, and the various methods of treating it, have been so frequently discussed of late years, that we do not feel warranted in dwelling upon the subject. Before closing the book, we feel bound to express our opinion that the author has produced a work evincing considerable surgical merit. We recommend it earnestly as well worthy the perusal of those who are more especially engaged in the treatment of the diseases of women.

## Contemporary Medical Literature.

### UREA AND URINE.

ACCORDING to M. Bischoff, the quantity of urea excreted under certain circumstances, and within a certain time, cannot be taken as the direct measure of metamorphosis and the tissues, even when the urine does not contain any other nitrogenized constituent. Still, it will always be the most important element for ascertaining its amount, and it will only be necessary to study more closely the influences exerted upon its formation and excretion, towards the elimination of which the author hopes to have furnished some contribution. Bayard states, that when coal-tar naphtha is added to urine, in the proportion of six drops for each pound, or a larger quantity of coal-tar, the urine may be evaporated to dryness in the sun without decomposing.—*Pharmaceutical Journal*.

### HOW FAMILIES ARE POISONED—SCHEEL'S GREEN IN BAKERS' SHOPS.

When about to cut the loaf on my table for breakfast, I observed some green patches and streaks over the partially burnt undercrust. The appearance was something like that caused by green mould, but, on examining the slices of toast in the toast-rack, I found similar green spots in the depressed portions of the crust of the toast. I then examined the green spots with a lens, and subsequently a portion was scraped off and examined under a microscope of low power. The coloured particles then resolved themselves into a mineral powder having all the appearances of Scheele's green, or arsenite of copper (a pigment which contains about fifty per cent. of white arsenic). Thinking that some accident might occur in other families, I immediately went to the baker, and showed him the Scheele's green and metallic arsenic extracted from it. On entering his shop I at once saw the cause of the poisoning of the bread. He had had his shop newly decorated, and

there were eight long shelves (holding some hundreds of loaves) painted of a bright grass-green colour—top-part and sides. They had been evidently very substantially coated with the green paint. The warm loaves placed on the recently painted shelves had imbibed a quantity of the poisonous pigment, which had dried on the undercrust. He took down five or six loaves in succession, and all were found stained with the arsenite of copper. There was enough on the crust of one of the loaves to have killed an infant; and I can suppose a case in which a nursemaid, about to quit a service for misconduct, might be seriously implicated by such an occurrence as this, unless the cause were at once traced.—Dr. ALFRED TAYLOR, in *Pharmaceutical Journal*.

## THE LANCET, THE LATE MR. BRANSBY COOPER, AND MR. JAMES LAMBERT.

To the Editor of THE LANCET.

SIR,—I see by THE LANCET of August 19th, of which I have been a reader and subscriber to ever since the first number was published up to the present time, that it is stated that poor Lambert wrote the report of Bransby Cooper's lamentable stone case. Now the fact is, that at that time I was a dresser at St. Thomas's Hospital, and was a personal friend of Lambert's, dining with him almost every Sunday at his house in the Waltham-road. I admired his principles, and liked him very much for his kindness of heart and good fellowship, &c., and when he was excluded from the wards of the hospital, he asked me to supply him (*sub rosa*) with a weekly report of all the principal surgical cases that occurred at St. Thomas's, which (as I was at that time taking notes of every surgical case that I saw, for the surgical prize, which I was awarded in 1826) I most willingly furnished him for some six months or more, so that I can truly say that I supplied Lambert with a true, fair, and just report of the operation, at which Lambert and myself were both present, he leaning the whole time of its performance on my shoulders, but which he pleased to cook up into the dress of a tragedy, and send as his own report to THE LANCET. After this, as I thought there was malice in the way in which he had altered my report, we became rather cool and distant. I shortly after went abroad for three years, during which time poor Lambert died, and so ended our acquaintance. I had many applications from Lambert to come and be a witness on the trial, but causes prevented it, for which I have been glad ever since. I entirely agree in every word you have said about Lambert. A nobler fellow never lived, and a greater enemy to the then, and sometimes now, hospital abuses could not exist. At that time it was a battle between justice and injustice, and I enlisted myself unknown under Lambert's banner and the former. I could fill sheets of paper of the occurrences of that time, as they are all vivid to my recollection; but having had to work my own way for the last twenty-one years here into general practice, other occupations have absorbed my time and thoughts than hospital reform.

I am, dear Sir, your humble servant,

Balham-hill, Surrey, August, 1854.

FRANCIS WARD.

## IMPROMPTU TRACHEOTOMY.

To the Editor of THE LANCET.

SIR,—It occurs occasionally to the medical practitioner to be called on, unprepared and unfurnished with the proper instruments, to perform the operation of tracheotomy. It may not, therefore, be amiss to state what may be done on such an emergency. A pair of pointed scissors exists in every case of instruments, and in every house. With these, the integuments over the trachea may be divided, and, the points being brought together, the trachea pierced; the points being then duly separated, a horizontal, longitudinal opening is made. If the case be extremely urgent, the handle of a teaspoon may now be inserted, and turned one quarter round; the opening is then patent, and the patient, if previously struggling for breath, is relieved, perhaps saved.

To render the tracheal orifice permanently patent, a portion of all the tissues surrounding and composing the orifice may be included in a loop of cotton, at four opposite points, and the cotton may be drawn tight, and fastened to a ring of wire, tin, whalebone, cane, or even card. If all these are absent, the pieces of cotton may be readily tightened by the operator and an assistant.

In this manner, life may be saved in the case of choking, and in other cases of laryngismus.

London, August, 1854.

DELTA.

## THE LANCET.

LONDON: SATURDAY, AUGUST 26, 1854.

DURING a lucid interval one of our contemporaries caught a partial glimpse of truth, and a fit of unwonted candour happening to coincide, he made his discovery known to his readers. Dr. CORMACK, after many years' scribbling, *insidè Afincrod*, has come to doubt whether "medical journalism has effected much good for the profession." We are unwilling to assent, without some qualification, to any dictum of Dr. CORMACK. We are not therefore prepared to admit that the profound remark we have quoted is absolute and incontrovertible wisdom. But still—a circumstance somewhat unusual in the homilies of this leonine writer—there is something in it, and the question raised is important enough to warrant a little discussion. In deciding upon a question of this kind, in which the *amour-propre* of journalists must, to a certain extent, influence their judgment, it is not to be expected, after a prosperous career of a third of a century, after witnessing the many reforms in the constitution of the medical body, and the almost sudden advances of Medical Science which have been effected since our labours began—it is not to be expected that we should, with such a retrospect, now begin—even though the sapient CORMACK doubts—to doubt the usefulness or value of the achievements of THE LANCET. So far then as we ourselves are concerned we demur, with all becoming respect, to the application of the CORMACKIAN theory. Beyond that we are not disposed to call it in question. That Dr. CORMACK should, after labouring for so many years under the delusion that he could write anything worth reading, have at length become conscious of his error, however mortifying to his vanity, is at least an unexpected testimony to his sagacity and candour. Dr. CORMACK's proposition then must be read as follows:—"Dr. CORMACK doubts whether CORMACKIAN journalism has effected any good for the profession." Far be it from us to dispute so self-evident a truism. We shall decide that his mental recovery is complete when the *cacothès scribendi* shall have finally left him. Until that event, it is clear, according to the principles of psychological medicine, that he must still be under the influence of his old delusion.

We have no objection, if it affords any solace to the wounded mind of the doubting Editor, to include in his proposition the journals owned by commercial speculators. It would not be difficult to show that publications, the chief end of which is to promote the trading interests of booksellers, and to defend the College monopolists who have always resisted the political emancipation and scientific enlightenment of the masses of the profession, can be of small benefit to the Medical Commonwealth. But there is a wide difference between journals conducted on CORMACKIAN and bibliopolist principles, and a free and independent press. There is a wide difference between journals devoted to the sordid labour of upholding the close and rotten bowwings of the medical political fabric, and a journal consecrated to the cause of reform and the obliteration of every mark of inferiority from the general practitioner. There is a wide difference between club and booksellers' journals, the organs of the few, and a journal whose sole end is the general good. The journals which Dr. CORMACK, in his lucid interval,

condemns, and which the great majority of the profession emphatically repudiate; the wretched instruments of a bigoted faction; the chosen allies of the GAYS, WEBBERS, and COURTENAYS; the *Paul Pry*s, *Ages*, and *Satirists* of Medical Literature, whose dull and venal pages are at the service—for a consideration—of any conspirators against the sanctity of private reputation;—truly may it be said that such journals can little advance the welfare or promote the "honour and dignity" of our profession.

At a time when a Medical Journal has become not merely a luxury but a necessity to the busy practitioner, it may seem idle to descant upon the uses of a Medical Press. In what other way can valuable knowledge be so readily and extensively diffused? Through what other machinery can an honourable *esprit de corps* be so well maintained? Through what other channel can the feelings and opinions of the profession be urged upon other classes of the community? Through what other means can the scattered many hope to expose and to check the interested designs of the few? Is the constitution of the medical body perfect? Have the general practitioners no wrongs to redress, no reforms to achieve? Those who would rightly appreciate the actual position of Medicine in this country must be at the pains to trace back its history to former times. By the light thus acquired, it will be understood that Medicine, like all other sciences and institutions, has been waging a painful and difficult struggle against oppression, bigotry, and monopoly. It will be seen that even now its enfranchisement is but partial; that the hostile elements of monopoly and bigotry are still at work; that the contest for freedom is not at an end. Medicine in its most unpropitious days was the abject drudge of the priesthood. Priests were often the most approved practitioners of medicine; Bishops licensed men for the double function of administering consolation to the soul and ease to the body. The physician, like the priest, was invested with the orthodox knowledge and authority to comfort the sick in right of the apostolical succession. An heretic doctor in those days was something far more monstrous than the veriest charlatan was or is now. Traces, and those not equivocal, of this subserviency of Medicine to Religion still remain.

In the time of the TUDORS and STUARTS, the subjection of Medicine to Religion was partially exchanged for that of Trade. Medicine, like many branches of Industry and Commerce, was made the subject of a profitable and closely-circumscribed monopoly. The trading and manufacturing monopoly-charters granted by the STUARTS scarcely differed in spirit from the charters conferred upon the College of Physicians. No one who has observed the conduct of the College, even during the last thirty years, can fail to discern evidence enough to show that that venerable body has defended its vested rights in a spirit worthy of the most grasping and unscrupulous of trading companies. The professed object in granting the College charters was the suppression of quackery and the encouragement of duly-educated practitioners. When did the College ever exercise its powers to protect the public from quacks? How many physicians of proved attainments and merit has it not persecuted to ruin? What has it ever done to promote the spread of medical knowledge, and to improve the qualifications of medical practitioners? Has it ever sought to promote any liberal measure of medical reform that promised to elevate the position of the general practitioner? What has been its constant guiding policy? What but the resolution to preserve

its exclusive privileges—to limit to the narrowest degree, the number of elects? Acting in this spirit, the College for a long time has drawn strength from the united bigotries of Religion and of Trade. The present Home-Secretary, Lord PALMERSTON, may remember—and probably, judging from the contempt with which he has recently treated the representations of the College, he does remember—that, when Secretary-at-War, he was strenuously pressed by Sir LUCAS PEPPS, then President of the College, to confine all the appointments of Physicians to the Forces to Fellows of the College! And this was at a time when no one could be a Fellow who was not a Graduate of Oxford or Cambridge, and therefore an orthodox member of the Church of England!

The College of Surgeons, which has an intimate relation with a large portion of the general practitioners, cannot be said to be influenced by a more liberal spirit. The same narrow desire to concentrate all governing power and professional advantages in the hands of a few; the same determination to keep the education of the mass of the profession at the lowest point; the same desire to degrade the general practitioner in the estimation of the public, and to foster the belief that its own Fellows constitute a higher order in the professional scale; the same desire to depreciate the provincial surgeon. According to the expressed declarations of the College of Surgeons, the members whom the College itself has recognised as surgeons are only qualified for the “ordinary emergencies” of practice. The provincial schools, and the eminent men who constitute the body of provincial teachers, are only qualified to prepare candidates for the inferior order of members. The right, the emolument, and the *prestige* of preparing candidates for the Fellowship is preserved for the London hospitals. Both the Colleges have constantly sought to extend and consolidate their monopoly by keeping virtual possession of the hospitals. The leading hospital surgeons and physicians have, as a rule, been also College magnates. One unjust monopoly has been made to prop up another, to the exclusion of all independence. The hospitals have been organized and conducted with no other view than that of keeping up the political supremacy and the professional *prestige* of the College cliques. The appointments were theirs; the right of drawing instruction from the poor was theirs; the right of selling instruction wholesale and retail, as a patentee dispenses licences, was theirs. No student or practitioner was so much as at liberty to publish what he saw or heard. Is it to be wondered at that, under such a system, aided by Collegiate examinations disgraceful for their laxity, the mass of the profession was kept in comparative ignorance or under the imputation of ignorance? that the public should believe in hospital surgeons and physicians as if they were the supreme oracles of Medical Science? Could any system be more ingeniously contrived to draw fees from every corner of the kingdom into the pockets of those in high professional power in the metropolis? Could any system be devised more certain to secure the degradation of the general practitioner?

In pursuance of this policy, the College and Hospital monopolists have always united their strength in opposition to every independent and liberal measure calculated to raise the standard of Medical Education and to elevate the position of the general practitioner. That they should oppose a free Medical Press, that they should lose no seeming opportunity of weakening the power of *THE LANCET*, is the most natural thing in the world. Their efforts in this direction are at once the most

convincing proof of the utility of this journal, and the most solid security of our continued prosperity. A free press is a mightier and more lasting power than any charter granted by TUDORS and STUARTS. In pursuance of the great principle which has ever animated *THE LANCET*, that of diffusing the practical and scientific knowledge gathered in our hospitals and public schools throughout the profession as common property, we have done more to break up the class monopoly of the metropolis than any other proceeding could possibly have effected. With our “Hospital Mirror” as his guide, the remotest practitioner may now be said to “walk the hospitals.” Every improvement in practice is at once circulated abroad, and submitted to the judgment and the experience of the scientific world. Thus the resources of the most distant practitioner are enlarged. It is no longer an axiom with the public—however fondly the delusion may be hugged at the Colleges—that the provincial practitioner is only equal to the “ordinary emergencies” of the profession.

Acting in another way, another formidable engine for the advancement of Medical Education and the elevation of the standard of the general practitioner, the University of London, has in like manner encountered the most determined hostility of the Colleges. We will not now recount the perils it met with from this source, and overcame, at the period of its foundation. We will point for a moment to its recent successful struggle in Parliament for equal rights with Oxford and Cambridge. In this struggle, the chief opposition came, as might be expected, from the College of Physicians. The veteran GUTHRIE, we are happy to say, as President of the College of Surgeons, exerted himself in favour of the Bill. Throughout its early perils, as well as in its recent struggles, we have given the Metropolitan University our hearty and consistent support. We believe it is also the best and natural policy of the Provincial Association to support the University. Probably they would have done so, but the *Journal*, which by a fiction is supposed to advocate their interests, is virtually the property of its editor. It advocates—if dulness and stupidity can be said to advocate—his northern prejudices; and when it suited him, he sold it outright to purchasers of slander. The University of London, which now enjoys the power of qualifying physicians to practise in the provinces, is emphatically and *par excellence* the Medical University of the country and of the general practitioner. And yet this institution has been opposed in its clearest rights by the *Association Journal* and the *Medical Gazette*. In like manner, the *Medical Gazette* is doing what little it can to advocate the scheme of Sir JOHN FORBES—a scheme in which the object of strengthening the hands of the College monopolists is hardly disguised.

Well might the brilliant CORMACK doubt whether CORMACKIAN and bibliopolist journalism can effect much good for the profession!

It is with much regret that we have to announce to our readers the recent occurrence of another act of great injustice which has been perpetrated by the authorities of St. Bartholomew's Hospital. It appears that for several months there has been a “lurking suspicion” amongst many evil-disposed persons who are the intriguing partisans of Dr. HUX, the superannuated senior physician of the Hospital, that Mr. CHALMERS MILES—a gentleman who has been educated at St. Bartholomew's, and whose name a brief period since was announced in this journal as one of those gentlemen that had

acquired the membership of the College of Surgeons of England—is no other than the accomplished author of the letters of the "Third Year's Student" upon the abuses of St. Bartholomew's, which were published in our columns about eighteen months ago. It would be a concession to personal rancour to admit this suspicion to be well or ill founded; but it is upon good authority that we are enabled to assert that Mr. CHALMERS MILES has for many months been subjected to the most violent persecution, and has been assailed, calumniated, and bitterly vituperated by the most conspicuous partisans of Dr. HUE's clique, ever since this suspicion has been prevalent at the great City Hospital.

Nothing can be more natural than that the senior physician and his jaundiced adherents should entertain a feeling of extreme prejudice—nay, of inextinguishable hostility—against any critic who has assailed them, and exposed the very evident shortcomings and backslidings of Dr. HUE with such candour and felicitous truth. But that the Treasurer of such an institution as St. Bartholomew's should descend from the exalted position which he occupies, and not blush to appear publicly, and in his official capacity, as the energetic protector and staunch adherent of an officer who has been successfully impeached of dereliction of duty and an utter disregard of the responsibilities of his position, is more than either ourselves or the profession would have ventured to prophesy. The facts, however, to which we are desirous of directing attention are simply these:—In the recent elections that have taken place at St. Bartholomew's, the Senior Physician and his too powerful friend, the Treasurer, although they have put forward the entire strength which they possess, have somehow or other been signally defeated in the candidate they supported. That candidate, as the public are aware, was Dr. HUE's son, a young man who had no sort of claim, beyond that of family influence, to support his canvas. When Dr. BALY, after a prolonged and arduous struggle, defeated his young rival for the post of assistant-physician, another vacancy, through the manoeuvres of the Senior Physician, was created by the Treasurer, with the ill-concealed intention of placing the defeated and unsuccessful rival of Dr. BALY, Dr. JOHN HUE, in the coveted appointment. In this scheme, however, the two plotters were again signally foiled, for Dr. KIRKES contrived, with great perseverance, notwithstanding that the most unscrupulous measures were directed against him by hostile and determined persons, to gain the very post which would not have been created if it had not been too confidently conceived that there was a certainty of the Senior Physician's son stepping into the appointment.

Such have been the defeats which the Treasurer's party have suffered within the last few months, and their method of retaliation we are about to narrate. There can be little doubt that most, if not all, the alterations which have been made at St. Bartholomew's within the last year are entirely due to the effectual advocacy which we rendered to the appeals of the "Third Year's Student," and to the ample correspondence which we published upon the subject. There can be as small doubt that our own corroborative remarks and the appeals of our correspondent have caused great offence, and led to the removal of many abuses. But defeated adversaries can never forgive the success of their opponents. Hence the injustice with which, on mere suspicion, as far as we can learn, Mr. CHALMERS MILES is treated.

Now, this gentleman, who, we are informed, has passed through a most exemplary and estimable career, was engaged,

about a year or more ago, to be Mr. LAWRENCE's house-surgeon at St. Bartholomew's; but, in consequence of the appointment of Mr. SKEY to the office of surgeon, Mr. MILES gave the preference, as we understand, to private friendship, and, with Mr. LAWRENCE's consent, entered into an agreement with Mr. SKEY to undertake the duties of his house-surgeon at the commencement of the usual winter session in October next. As a consequence of this step, the name of Mr. CHALMERS MILES was submitted to the consideration of the authorities, and to our great astonishment we learn that the Treasurer desires to stultify his nomination upon the sole ground, *not*—will it be believed?—of professional incapacity, *not* because there is a word breathed against this gentleman's reputation, but simply because Mr. MILES is supposed to have submitted to the public, in the columns of THE LANCET, some observations concerning the inefficient manner in which the Senior Physician of St. Bartholomew's Hospital had discharged his duties as an officer in a public institution.

But although there does not exist the person who can impeach the veracity of a single assertion which has been made with reference to the physician in question—although even Dr. HUE's own colleagues acknowledge the strict justice with which he was criticised, and the still greater neglect of duty which he now exhibits compared with the time when the "Third Year's Student" addressed us—still this is actually, at the present day, publicly made the ground upon which Mr. CHALMERS MILES is most contemptuously and insultingly refused his nomination to the office of house-surgeon. That the public or the profession will suffer him to be assailed with such atrocious injustice and arrogant insolence, we will not believe. There is much more involved in this matter than the rights of a single individual: a principle of extreme importance, and one which deeply affects the welfare and good working of every hospital throughout the empire, is about to be attacked.

Can the authorities at an hospital exert all the influence that their position enables them to command against every pupil who, in the course of his studies, discovers many abuses which require remedy, and feels persuaded by experience that unless public attention is directed to the subject no redress is attainable—can they, we say, be permitted to abuse the influence they may possess in order to crush and traduce every such pupil? If malicious misrepresentations were made, if masked lies were published, if unblushing effrontery or open untruth were paraded before the profession, we can then conceive that, if such an author was recognised, it would be quite competent for the authorities—supposing the person in question were still in the pursuit of his medical studies under the guidance of the very teachers he had so maliciously traduced—to require him to desist under pain of expulsion, or offer an implicit avowal of the grievous wrong of which he must feel himself to have been guilty. But the authorities of St. Bartholomew's have no such case before them. The individual whom they are so unworthily endeavouring to ruin is no longer a mere student; he is a qualified member of our profession; and even the remarks which he is suspected to have offered were published a year and a half ago; and it argues much for the foresight of the writer that every assertion he has made, even to minute particulars, has been amply verified; and that the charge of nepotism, which had been proffered by that writer against one of the officers, has not only turned out within the last few months to be perfectly just and strictly true, but it is at this moment a subject of annoyance to the Treasurer and his plotting

coadjutor that their attempted nepotism was thoroughly exposed and overthrown.

Now the charge, we beg our readers to remember, which is directed against Mr. CHALMERS MILES, is not that he has unjustly criticised the conduct of the *hospital authorities*, for that allegation was made, and subsequently withdrawn because it could not be maintained; but that he is supposed to have made some remarks against Dr. HUR, which remarks are actually true. The most Jesuitical proceedings are therefore instituted against him, and we believe Mr. MILES will be the victim of the insufferable and ferocious hostility, misrepresentation, and calumny, with which the Senior Physician's adherents are assailing him, unless he is rescued from their resentful clutches. Other persons would be betrayed if any avowals were made, and it is with regret we learn that the lips of Mr. MILES are sealed on this subject.

We cannot, however, believe that the Governors at large, now that their attention is directed to it, will suffer this great injustice to be perpetrated against one who, if he be the individual assumed, has done more good to St. Bartholomew's than any other person who ever entered within its walls. The Governors recently defeated the Treasurer's wily schemes in favour of Dr. HUR's son, and upon two distinct occasions disaster has befallen him. Will they now permit him to use all his authority, upon mere suspicion, to blast the professional prospects of a gentleman who in such a struggle has only his own abilities to rely upon, together with the sense of justice on his side, to aid and sustain him in the arduous encounter?

Should the Governors, however, remain apathetic, we cannot but suppose that Mr. CHALMERS MILES will take such measures in his own behalf as will cover his opponents with the dishonour they deserve. It is probable that proceedings may be instituted against the Treasurer, because it is most questionable whether the authorities have the legal power to prevent Mr. MILES, if he so desires it, from acquiring the house-surgeoncy in express opposition to the Treasurer's authority. But we will not dwell longer upon this painful subject. In due time every circumstance connected with it will in all probability be submitted to the impartial opinion of the profession, who, we have not a doubt, will, in their righteous judgment, record a verdict in favour of Mr. CHALMERS MILES against the disingenuous hostility of the Treasurer and his unscrupulous coadjutors.

SHORTLY after the outbreak of Cholera in Newcastle, last year, we adverted to the subject in more than one article, and attributed the great virulence of the epidemic there to the existence of removable causes of disease, whose permitted existence was a disgrace to the local authorities. After the epidemic had left that town, a Government Commission was prayed for, to investigate the causes of the terrible mortality which had prevailed, chiefly, we believe, at the instance of some public-spirited medical men, who were willing to risk some unpopularity from interested or benighted parties in promoting the sacred cause of humanity. The Commission was composed of JOSEPH BURNLEY HUME, Esq., JOHN SIMON, Esq., and JOHN FREDERICK BATEMAN, Esq.; and a Blue Book has just appeared, containing the results of their investigation. It appears from this Report, that the general sanitary condition of the town is very bad, although, as we pointed out, probably

no town in the kingdom, from its situation, should be more healthy. According to the Commissioners, in the fifteen years from 1839 to 1853, both inclusive, "the town of Newcastle has been visited by various epidemics, some of which have been unusually extensive and malignant." In the last attack of Cholera, above 1500 out of a population of 90,000 perished. During the fifteen years already referred to, the average rate of mortality was 28·6 per annum! In allusion to the local authorities, they (the Commissioners) "cannot but feel shocked at the spectacle before us—a spectacle which is rendered only the more deplorable by the consideration that the Corporation of Newcastle is not only ancient, wealthy, and influential, but has for at least seven years possessed, under its own local Acts, (in addition to those conferred on it by public Statutes,) unusually extensive sanitary powers, the exercise of which could not have failed signally to mitigate and reduce this excess of disease and mortality." They call attention to the fact, that the mischief likely to result from the existing state of things has been for years pointed out to the authorities by the same public-spirited medical men to whom we have alluded; and that the conduct of these authorities was the more censurable, inasmuch as nearly all the tenemented property of the town was in their hands as private individuals, or under their management as belonging to the Corporation. The evidence of the injurious effects produced by the supply of water being principally derived from the Tyne is also fully confirmed in this Report. Thus in 1831 and in 1853, the two years in which the epidemic raged most violently in Newcastle, the water supply was derived almost entirely from the Tyne, and the epidemic was most virulent. In 1848-49, when the town was better supplied, the outbreak was mild; and in 1853, in a few days after the Water Company ceased to draw its supply from the Tyne, the disease began to abate. The cost of the epidemic of 1853 to the town of Newcastle, in public money expended, a subscription raised for the victims, and the calculated value of the additional rates for the support of the widows and orphans, may be estimated at £35,000! But who can estimate the injury to commerce at the time, and still more, another misery which is not to be reckoned in current coin of the realm?

Whether this Report will open the eyes of those concerned is another question; it certainly ought to justify the promoters of the inquiry in the eyes of their fellow townsmen. But this, although very well in its way, is not the kind of Commission advocated by THE LANCET. We would have had a Board of Health which, the moment the Cholera was announced last year, instead of merely sending down its medical and other inspectors, should have sent meteorologists to study the atmosphere, chemists to analyze the water, pathological microscopists and chemists to apply their sciences to the study of the disease. When these views of ours are carried out, then, and not till then, will there be some hope of our vanquishing Cholera.

QUEEN'S COLLEGE, BIRMINGHAM.—At a special meeting of the Council, held on the 12th instant, the Vice-Principal in the chair, the following alterations in the Professorships and additional appointments were made to meet the requirements of the Army, Navy, and India Boards:—*Materia Medica and Therapeutics*: Dr. Fife.—*Surgical Anatomy*: Mr. Sands Cox.—*Descriptive Anatomy*: Mr. Langston Parker.—*General Anatomy and Physiology*: Dr. Heslop.—*Comparative Anatomy and Zoology*: Dr. Jordan.—*Assistant Demonstrator of Anatomy*: Mr. Walter Careless Freer. Richard Grainger, Esq., has accepted the invitation of the Council to open the Winter Session.

## THE LATE INQUEST ON ALFRED RICHARDSON.

*To the Governors and Friends of the Royal Free Hospital.*

The Committee of Management of the Royal Free Hospital consider it to be their duty to place before the Governors the following brief statement relative to the inquest on the body of Alfred Richardson. As the Governors are aware, the verdict affected the professional conduct of two of the surgeons attached to the institution.

With respect to one of those gentlemen, the Committee have merely to remark, that he was in nowise responsible for the operation which furnished the ground of the inquest; and that the attempt to implicate him by the verdict of the jury simply proves the amount of prejudice which existed in the case, and to which the Committee will presently more particularly refer.

The other gentleman noticed in the verdict (Mr. Cooke) was the actual operator. The operation was lithotomy. The patient was a boy, three years of age. The operation was unsuccessful. The verdict imputed its failure to a want of skill. Mr. Cooke, with a high feeling which the Committee are convinced will be appreciated by every governor, placed his resignation in their hands. But the Committee, remembering Mr. Cooke's testimonials, and his long and tried services in the hospital; considering that for more than ten years he had been actively engaged under their constant observation; that during the whole of that time, not only had no want of care or of ability ever been laid to his charge, but that, on the contrary, he had uniformly proved himself a most humane and efficient officer; considering further, that, according to professional testimony of the greatest weight, the misadventure which in this instance befel Mr. Cooke has happened many times in the hands of surgeons of the highest standing in the profession,—have deemed it to be their solemn and bounden duty, as well towards the Hospital as towards the medical profession and the public, to request Mr. Cooke to withdraw his resignation, and continue one of your surgeons. And in so doing the Committee feel confident of securing the hearty approval of the Governors of the Charity.

Charges were made at the inquest, which, if true, would implicate the general management of the Hospital; and to which, although they were entirely refuted, the Committee would request your particular attention.

It was stated by counsel that the patient was under the operation for an hour and forty minutes; whereas it was distinctly proved by evidence on oath that not more than fifty minutes elapsed from the child being taken to the surgeons until it was returned and placed in bed, and that at least fifteen minutes of that time were occupied in administering chloroform and restoring the patient, so that the actual operation did not exceed thirty-five minutes, (not a very unusual period in difficult cases;) and that during that time the patient was under the influence of chloroform.

It was said, that after the operation the unfortunate child was neglected by the medical officers, and treated by the nurse with revolting brutality.

It was asserted that a post-mortem examination had been made without the consent of the parents.

It was alleged that the Coroner for Middlesex, being, as you know, a member of the Committee, endeavoured to prevent an inquest from being held on the deceased.

It was insinuated that when the inquest was, in fact, about to be held, a sum of money was paid, at the instance of the Committee, in order to procure its suppression.

It was pretended that the operating table was, by order of the Committee, used also for dissections.

And it was declared that the Committee had invited Mr. Gay to return to the Hospital.

A few words will show how completely and absolutely every one of these charges was proved to be unfounded.

The alleged neglect and ill-treatment of the patient had no other foundation than the assertions of a female unconnected with the Hospital, but who was permitted to attend upon him at his parent's request, and of another person who had been for a short time employed in the Hospital. Their testimony was contradicted, on oath, point by point, by every one of the parties implicated. The contradiction was further sustained by the evidence, on oath, of several patients of respectable character, present in the ward with the child, all of whom also distinctly swore that the alleged ill-treatment could not have occurred without their cognizance. Moreover, the chief accusing witness was proved, on the oath of the summoning officer of the court, to have confessed the falsehood of her charges with bitter contrition; and subsequently, when she

herself was again placed before the Coroner, she repeated this confession with respect to the most important points.

Evidence on oath was given that the father of the child sanctioned a post-mortem examination.

The Coroners for Middlesex entirely disposed of the charge that they had thrown obstacles in the way of an inquest. Mr. Wakley, having felt that his connexion with the Hospital rendered it undesirable that he should himself preside over the inquiry, requested his colleague, Mr. Baker, who was entirely unconnected with the Hospital, to act in his place; and that gentleman, in the exercise of his discretion, after the father of the child had withdrawn his application, declined the first inquest.

The accusation that a sum of money was paid at the instance of the Committee, or of some person acting under their influence, to procure the suppression of the inquiry, is one of those scandalous fabrications which unfortunately find too ready an acceptance in certain minds. It is a pure invention. It arose from the fact, much lamented by the Committee, that a solicitor, retained by Mr. Cooke to watch the case on his behalf, paid the attorney representing the parents of the deceased child a sum of money to withdraw the application. Both these gentlemen have narrated on oath the whole transaction. Mr. Cooke's solicitor declared he made the payment in question of his own mere motion, without any authority to do so, either from his own client or from the Committee; and the latter body, from their very first knowledge of it, deplored and repudiated the whole affair.

The allegation respecting the identity of the operating and dissecting tables came, the Committee regret to say, from the mouth of Mr. Gay, late surgeon to the Institution. A visit to the Hospital, which is always open to public inspection, will satisfy any one of the groundlessness of the accusation. The tables in question are not only distinct, but are, and always have been, placed in separate apartments. In October last, the following resolution passed by the Committee was sent to Mr. Gay and the other surgeons of the Hospital:—

Resolved,—“That a commodious theatre having been erected in the Hospital, the chief operations in surgery be henceforth performed therein, except in cases where the removal of patients would be attended with danger.”

In the theatre referred to is a lecture table and the operating table. The latter was in the possession of the Hospital, and had been many times used by Mr. Gay, long previous to the existence of the theatre. This table, from its peculiar construction, is totally inapplicable for dissections, and has never been so used. If therefore Mr. Gay ever performed surgical operations on a dissecting table, he must have so operated by his own choice and not from necessity.

The Committee most unequivocally deny that any overtures were ever made to Mr. Gay by them, or with their knowledge or sanction, to induce him to resume his position at the Hospital.

Such were the only tangible charges made against the Managing Committee at the late inquiry, and complete and ample was their refutation. In point of fact, there was originally no reason for holding an inquest in the case at all, more than in any other instance where an operation has terminated fatally. The manner in which it was “got up” may be briefly noticed—the facts were established on oath.

The operation took place on the 13th of April, and the child died on the 16th. Three weeks after the death, and not till then, the Coroner was first applied to.

On the 22nd of April, Mr. Gay, already mentioned, who had repeatedly declared “*he would ruin the hospital*,” consulted an attorney. He had heard, he said, in general terms, that some operation at the Royal Free Hospital had terminated fatally. He instructed the solicitor to “*furrag out*,” as he expressed it, the circumstances of the case. This gentleman fulfilled his client's desire, and applied to the parents of the child. An inquest was demanded, and appointed to take place. Mr. Gay desired his attorney to retain counsel, advanced him the fees for that purpose, and instructed him also to reject all terms of compromise.

But as the inquest approached, and it became probable that the secrecy which had so far shrouded Mr. Gay's interference would be at an end, that gentleman appears to have become alarmed, and expressed a wish that the proceedings should cease. His attorney replied, it is too late; “*the parents expect to make some money by the case*.” However, the attorney took the money of Mr. Cooke's solicitor; from that sum he reimbursed Mr. Gay, and divided the remainder between himself and the parents. The latter thereupon signed a declaration that they were satisfied, withdrew their application to the coroner, and the matter was considered to be at an end.

The Committee conceive it needless to trace the subsequent intrigues which led to its revival.

Such are the facts which first came to the knowledge of the Committee from the evidence on oath of Mr. Gay and the two solicitors at the inquest. Comment is superfluous. It is only too evident, that for the purpose of damaging the management of the Hospital, a discarded officer (Mr. Gay) has deliberately attacked the professional character of his successor; and that with this view a casualty, such as might have occurred to the most experienced operator, has been attempted to be exaggerated into a grave default of skill, reflecting upon all concerned in the appointment of the surgeon whose competence was thus maliciously and unworthily assailed.

The Committee have already marked their sense of the injustice of the imputation by requesting Mr. Cooke to withdraw his letter of resignation. In so acting, the Committee hope and consider that they have done no more than their duty to the Hospital, to the medical profession, and to the public at large. To the Hospital, because the efficiency of the medical staff must depend in no slight degree on the support afforded to it against unjust attacks. To the profession, because the Committee refuse to acknowledge a single failure in an operation as a proof of general incompetency. To the public, and especially to the poor, by protesting against a verdict which must tend to unnerve the hands of all operators, their colleagues and assistants, and to deprive hospital patients of one great security, the confidence of their medical officers that a casualty will not be treated as a crime.

In conclusion, your Committee would state that there is nothing which they so much desire in all that relates to the management of the institution as publicity. The Royal Free Hospital, at all seasonable hours, is open to public inspection, and the meetings of the Weekly Board are open to all Governors.

Having to the best of their ability endeavoured to uphold and extend the usefulness of the institution, your Committee with much confidence make this appeal to the public. As for the charity itself, and its claims to undiminished public patronage for the future, it is only necessary to refer to the past—to its twenty-six years' career of public beneficence—to the number of suffering human beings whose sorrows have been alleviated (upwards of 460,000 since the foundation of the hospital)—to the hundreds and thousands of diseased and destitute strangers and wanderers who are annually relieved by its aid—to the large numbers who daily and weekly are partaking of its benefits—and to the fact that, amongst the medical officers and governors of the Royal Free Hospital, gentlemen are to be found who for social standing, intelligence, and philanthropy, are not surpassed in any other charitable institution throughout the country.

By order of the Committee,  
Board-room, Aug. 7th, 1854. T. BEALE BROWNE, Chairman.

## Correspondence.

### PRACTICAL OBSERVATIONS ON CHOLERA.

To the Editor of THE LANCET.

SIR,—Present circumstances favour the belief that the following remarks may be considered worthy the columns of THE LANCET:—

It may be confidently asserted that speculative writing on cholera has proved a failure, and that with respect to its nature and essence we are now in the same position as at the period of its first irruption. However desirable, in a scientific point of view, a knowledge of its abstract nature may be, it is no less desirable that we should acquire every certainty respecting its treatment. The latter desideratum is to be anticipated from the collation of individual experience. Personally I have to answer for a considerable share of opportunities for observing the onset and development of this formidable malady; and my present purpose is to submit the results of that experience to the consideration of my professional brethren.

We judge of causes by their apparent effects, but we cannot on all occasions associate them. Successful practice is not always founded upon established theory; neither can it be denied that more importance attaches to the consideration of the former than the latter, however specious.

To the congregation of certain symptoms we give the name typhus; to others, measles; to others, small-pox, &c.; but we know nothing concerning the agent producing them. Just the same may be said of cholera. We believe that the poison which occasions this fearful disease emanates from certain con-

ditions of matter, but beyond this we are totally ignorant. The opinion which I formed of the nature of cholera in 1832, all subsequent experience has tended to establish—that it is a febrile disease, occurs sporadically as well as epidemically, and is essentially contagious. The rationale of treatment then adopted I have had no reason to relinquish. Experience has induced variety in the means; but the purpose—the expulsion or counteraction of the poison—constitutes the main object of my endeavours to this day. The present alarming outbreak of the disease in this town has supplied the opportunity for so testing the practice as to warrant its recommendation to the profession.

It is a serious question for the medical profession to determine whether the premonitory diarrhoea of cholera should be indiscriminately arrested; and it becomes no less an important public inquiry, seeing the universal administration of what are called "astringents," from the comfortable *ad libitum* brandy and water to the most popular quack specifics. In the belief that the vomiting and purging, so characteristic of cholera, do not constitute the disease, but are simply an effort of nature to throw off the poison, I should as soon think of trying to arrest these indiscriminately by astringents as to suppress the skin eruption in measles, small-pox, &c. In all cases of bowel irritation, during the prevalence or apprehension of cholera, I prescribe castor oil, combined with any of the preparations of ammonia. In every stage of real cholera, from the first onset of diarrhoea to the very verge of collapse, I give either castor oil and oil of turpentine, or the latter with yeast. I never saw an instance where immediate relief to the symptoms did not follow, and scarcely one where the stage of collapse supervened—may, even the last fatal prostration has in some remarkable instances during the present epidemic been changed into reaction and recovery by the turpentine and yeast. But from a knowledge of the potent effects of yeast in malignant typhus, small-pox, &c., I was first induced to try it in cholera, combined with the turpentine; and certainly, if fresh brewer's yeast could always be obtained, I should use no other remedy than the following combination:—Yeast, a tablespoonful; oil of turpentine, a teaspoonful; cold water or barley-water, two tablespoonfuls: the dose to be repeated every second, third, or fourth hour, according to circumstances.

Pressing engagements render these observations desultory and imperfect; but under more favourable circumstances I may, ere long, be enabled to bring further evidence in support of the above plan of treatment.

I am, Sir, yours very faithfully,

Middlesbro'-on-Tees, Aug. 1854.

L. F. CRUMMEY.

### A SHADOW OF A RATIONAL TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—Nothing is more striking, in the history of malignant cholera and its treatment (?), than the great number of powerful medicines, of entirely opposite actions, which have been employed with asserted benefit. Very large and very small doses of calomel, common salt, tartar emetic, phosphorus, creasote, iced water, sulphuric acid, opium, soda and salines, transfusion, sulphur, nitrate of silver, acetate of lead, sulphate of copper, purgative doses of castor oil, are some of the most vaunted methods of opposing the dread pestilence which has now, for the third time, invaded us. To my mind the incongruity of the medicines administered, and the similar results said to be derived from all of them, show conclusively that no treatment hitherto proposed has more than the slightest influence in checking real Asiatic cholera. As regards simple diarrhoea, relief may be obtained by very different, and apparently opposite, plans of treatment; but, as regards genuine cholera, our chaotic therapeutics show but very poor results.

The profuse serous loss from the bowels is evidently the thing which kills. The collapse is not much, if it is anything, more than the exhaustion following upon what may be called a profuse and continued serous hemorrhage. The pouring out of the serum *sanguinis* by the stomach and intestines, is just as though the great arterial trunks of the coeliac axis and the superior and inferior mesenterics, were wounded so as to allow the escape of the serum of the blood to that point of exhaustion beyond which restoration is impossible.

During the profuse serous intestinal flow of cholera, after it has fairly set in, no medicines are of any avail. The bowel is as if dead! Some preposterously give castor-oil to "clear out" the bowel already flooding forth, not only its own contents, but the serum of the blood. Others give dilute sulphuric acid as an astringent. It seems in the one case like

trying to stop, and in the other to arrest, a railway-train at full speed with an infant's finger! Probably elaterium or croton-oil would not *increase* the purging, nor all the astringents of the *materia medica* arrest it. The remedies cannot get at, or into, the system while it is suffering from this scourge. The thing most comparable to the collapse of cholera is the collapse which occurs after uterine hæmorrhage.

This brings me to the suggestion which is the main object of the present letter. Why not try mechanical pressure to the flooding bowel, on the same principle that we apply it to the flooding uterus? The cœliac axis and the mesenteric vessels might be compressed as effectually as the uterine. I would propose that, during the serous stage of cholera, a broad band should be placed round the abdomen, with a solid pad extending over it in front, similar to the apparatus recently applied to the arrest of flooding after delivery. To this a screw should be affixed in the same way as in the ordinary tourniquet; and with such a power the abdominal pad might, I believe, be pressed upon the bowel to such an extent as to render the rapid loss through the vascular system of the intestines impossible! An abdominal tourniquet, in the absence of anything like the above, might be arranged almost extemporaneously by any person of ordinary ingenuity. There is, it must be remembered, no pain nor increased sensibility of the bowels, such as would contra-indicate the use of abdominal pressure.

Trusting that you will approve of this suggestion, and that some of your readers will carry it into effect,

I am, Sir, your obedient servant,

M.D.

August, 1854.

## TREATMENT OF CHOLERA BY TURPENTINE.

To the Editor of THE LANCET.

SIR,—Knowing the value of giving, in some conditions of the mucous membrane of the intestinal tube, the rectified oil of turpentine, it occurs to me to be a remedy worth a trial, either alone or in combination with calomel and opium. Turpentine will restore healthy secretion, and give more tone to the whole membrane than any remedy I know of, as also a stimulus to the secretion of urine. Admitting it to be a nauseous dose, in conjunction with a grain pill of solid opium it might be retained on the stomach. It must be considered that the whole tube is empty after several dejections, and turpentine might be brought in contact with it by the mouth, as also by injection per rectum. Again, its antispasmodic effect is great, and, if of use externally, it should be well rubbed over the whole surface of the abdomen, when it would be quickly absorbed. Cholera has not shown itself around me, or I would very soon prove its effects. I quite think it deserves a trial, in twenty or thirty drop doses, in conjunction with pills of calomel and opium.

Yours obediently,

A COUNTRY SURGEON.

August, 1854.

## THE MEDICAL EXAMINERS OF THE EAST INDIA COMPANY.

To the Editor of THE LANCET.

SIR,—Your strictures respecting the recent appointments of Medical Examiners to the East India Company are exceedingly just, and have given much satisfaction to the profession. To pass over experienced practitioners like Mr. Martin, Dr. James Bird, Dr. Jackson, Dr. Goodeve, and a host of other eminent gentlemen who have creditably served the Company during many years, is very poor encouragement to any future medical officer, and constitutes a severe censure upon such proceedings of the ruling authorities. I do not mean to allude personally to the fortunate individuals said to have been nominated; but I do think no person filling the responsible appointments under discussion should be connected with, or have an interest in, any medical pupil manufacturing establishment, whether school or university. The examiners to the Indian Government should be altogether independent of local influences, practically experienced in the maladies incident to India, and also well acquainted with the duties medical officers will be called upon to perform in that country. Besides these important qualifications, the above officials ought to know something of ophthalmology, midwifery, and the diseases of women and children, not forgetting insanity, which now very properly forms one of the acquirements demanded in all candidates. Such essentials are far more useful, and will prove of much greater real value to Indian medical officers, than botany, zoology, microscopy,

theoretical animal chemistry, minute, but often imaginary anatomy, and even of delightful physiology—however transcendental. Considering it highly important that the new system of competition for Indian medical appointments should work satisfactorily, and be devoid of all suspicion, the Directors and Board of Control ought to have placed the office of medical examiner either to be filled up by an open “concours,” or adopted the plan followed at the London University, of first advertising for candidates, and then selecting—by the senate—from those who sent an application, the person considered best qualified. This method would have been far better than that recently pursued; which, it is rumoured, has already produced well-founded dissatisfaction in various quarters. When Parliament meets next session, perhaps some independent member may ask the Indian Minister, as happened to one of his colleagues, in reference to the cases of Stonor, Lawley, and O’Flaherty—On what grounds were these nominations made? Or, to use the words of another medical journal, whilst alluding last week to the subject:—*Were these situations given as “the rewards of merit, and not the results of intrigue and favouritism?”*

I am, Sir, yours &c.,

MEDICUS.

August, 1854.

## ELECTION OF MEDICAL OFFICER TO THE CHARTER HOUSE.

To the Editor of THE LANCET.

SIR,—I was one of the twenty candidates for resident medical officer of the Charter House, and was requested to send in my testimonials, accompanied with a guinea; but having had early intimation from within the Charter House walls, how, and in what manner the office would be filled up, I declined to part with the glittering coin. You are probably aware that the office was given to the usual medical attendant to the master.

I am, Sir, your obedient servant,

WM. WALKER, F.R.C.S. & L.A.C.

St. John-street-road, Clerkenwell, Aug., 1854.

P.S.—My attention was directed to the Charter House, from reading a letter from “M.R.C.S. & L.A.C.,” in THE LANCET of July 29th.

## THE CHOLERA.

It is related of an eminent musical composer, (Haydn,) that he never could write without being *en grand tenue*, and that he invariably dressed himself as if for a party ere he sat down to court “the tuneful Nine.” It is the same with many around us as respects the miseries and unhappiness about them: unless they can meet the sufferings of their fellow-beings in connexion with fashion, wealth, or respectability, they endeavour to shut their eyes to their slightest recognition, and consider them as quite excluded from their own privileged acquaintance. A railroad accident may occur, and a few “stokers and pokers” or third-class passengers be killed, and comparatively little is thought of it; but let a noble lord or equestrian bishop tumble off his horse in the “ring,” and break his collar-bone or head, and sad and doleful indeed is the lamentation. Such is the peculiarity, in fact, of some of our conventional rules, that half the time of the inhabitants of Belgravia and Mayfair is taken up with making *kind inquiries*, and going through other analogous absurd and heartless formalities, on the one hand, and *returning thanks* for their performance by their friends on the other. And yet these same condolers, in the least untoward contingencies of “births, deaths, and marriages” of patrician character, are blind, deaf, and senseless to plebeian misery and disaster of the most forlorn and desperate description. A touch of the enchanter’s wand, however, will often convert the most apathetic looker-on a scene or hearer of a story of misery, into the most melancholy of sympathizers; but that enchanter must be—*respectability*. There is no less a difference in this point than between the character of the places where *respectability* and *commonality* have their birth. The one we have no necessity to delineate, as few feel repugnance in making acquaintance with its locality; the other we may give a slight sketch of as lately described by a correspondent to a daily paper, (*Daily*

*News*, Aug. 16th,) who, in alluding to the low parts of St. Clements Dances as a "London fever hole," thus draws the abode of many Christian men and women of "Merric England":—

"A track through the heart of the Black Forest, or a pass through the bowels of a mountain in Arabia Petrea, could not be more close and gloomy. You might walk here in a good stiff hurricane, and hardly know it; a summer shower might pass, and leave you dry. You are in the region of perpetual shadow; and the women and children who sit or sprawl upon the door-steps are scarcely less in doors than when languishing in their dark and fetid rooms. And no wonder; for, according to actual measurement, the courts vary in breadth from six to twelve feet. .... Here are the holes in which our human fellow-creatures swarm like vermin. According to a report published in the *Daily News* of May 1st, no less than fifty inmates were found to reside in one of the houses in Middle Serle's-place, (formerly Little Shire-lane;) and in Ship-yard many of the houses are built back to back, entirely preventing thorough ventilation. The gentlemen who made the examination state that water-butts are kept in underground cellars, the walls and flooring of which are continually damp to the touch, and where the water, imbibing the filthy exhalations of the place, acquires a dreadful odour; that the ceilings of some of these cellars are actually below the level of the roadways, so that the inhabitants are obliged to burn candles through the whole day, with the exception of a few hours, and that terrier dogs are kept in many of the houses as a protection against the rats. Yet out of these hideous tenements considerable sums of money are drawn every year by letting and sub-letting. .... Hideous women, foul and slatternly, loll out of windows or lean against door-posts, overcome with the terrible lassitude and indolence which cannot fail to arise from the influences by which they are surrounded; not impudent and brazen, but oppressed with the hopeless burden of their lives. The children, sullen, dirty, and fierce,—young tigers without their beauty or their health,—play or fight in the roadways, amidst cabbage-stalks, potato-peelings, oyster-shells, and standing puddles. Men are very seldom seen. And over the young and the old tower the melancholy house fronts, shutting out the sky and the breeze, and black and saturated with the pestilent vapours which, rising unseen around them,

Hang their poison  
In the sick air."

We have been led to these remarks from observation of the sympathy which the no doubt lamentable enough demise of the late Lord Jocelyn, from cholera, has excited amongst the inhabitants of the "far West," and, indeed, of less fashionable quarters. But alas! should it be that deep-felt, or at least strongly-expressed, sorrow at the devastation of a pestilence is only to be perceived as it affects those of "purple and fine linen" in the land? Is it only when our gardens and our squares, our terraces and crescents, feel the sword of the avenging angel, that lamentation will arise? May our courts be hot-beds of pestilence, and our alleys sinks of plague—may our working men die by hundreds of cholera, and our poor sink by thousands into an unhonoured grave, and yet scarcely a sense of sympathetic feeling make known its existence, save what may express the fear of "catching the disease"? How long, may it be asked, will the reports of the Registrar-General be permitted to record such testimony as the following:—

"At 4, Church-crescent, Kennington, on the 5th of August, the son of a carman, aged one year, 'cholera, (twelve hours.)' Mr. Rugg, the medical attendant of this case, says:—'An open ditch is at the back of the premises, into which nearly all the privies of the neighbourhood are drained, and into which for the last few days the rain has been constantly pouring and stirring up its contents. Several children have lost their lives by falling into this open ditch; but nobody can tell how many deaths from cholera, fever, &c., owe their origin to this abominable nuisance.'—At 9, Patriot-street, on the 8th of August, a painter, aged twenty-five years, 'diarrhoea, (one week,) cholera, (eleven hours.)' Informant and other neighbours stated that this house is in a shameful condition. The soil from the closet has saturated the ground all over the yard. One family lives in the kitchen, another on the ground floor, where a man lies ill with fever; a third did live on the floor above, where this case occurred, and whence the wife of the deceased has been removed, also ill with cholera. Diarrhoea had been neglected. Some hours after being attacked, a vender of Dr. Coffin's medicines was called in, and administered his preparations. —At 2, Somerset-cottages, on the 8th of August, the daughter of a potman, aged eighteen years, 'cholera, (sixteen hours.)' This house is one of a nest of cottages built at the edge of the common sewer; the house

consists of one room, eight-feet-square and seven feet high. In most of these cottages six or seven people sleep.—At 2, Slater's-court, Blue-anchor-yard, on the 8th of August, a coal-whipper, aged forty-six years, 'Asiatic cholera, (fourteen hours.)' The informant says the deceased was a coal-whipper, and was a sober, strong, healthy man; he had not a day's illness before for eighteen years. He was at work till half-past one o'clock, and died in twelve hours after. Taken with diarrhoea, and had medical attendance directly. Left a wife and five children, the eldest only thirteen years of age. *He died on Monday, the 7th, and was not buried till Sunday, the 13th instant. Why kept so long?* I think in the two last visitations of cholera I registered more deaths in this court than in any other of my district. Slater's small court has only ten houses, (no yards and no back windows,) three rooms in each house, every room filled with a poor family, and each house has a cellar, and eight of these let to the poor to sleep in, on straw, at 6d. and 8d. each a week. Plenty of water in the court, which is in a dreadfully filthy state with fish, cabbage leaves, &c.; the scavenger only comes once a week to remove it."

The death of the noble lord alluded to above has given rise, as might be expected, to numerous letters in the newspapers upon various points relative to the event. From amongst them we select the following paragraph from the letter of a correspondent in the *Daily News* of August 16th:—

"Permit me to say, that the case of Lord Jocelyn is no exception to the rule laid down—that no individual in perfect health, and free from diarrhoea, is ever at once struck down by cramps, vomiting, &c.,—by cholera, in fact; but that every individual has, for a few hours, a few days, or a few weeks, a diarrhoea which warns him that he is about to be attacked with spasms, vomiting, &c.,—with all the urgent symptoms of cholera."

As a pendant to the above, we add the following memoranda from the "Weekly Returns" of the Registrar-General for the weeks ending August 5th and 12th.

"At John-street, Cambridge-heath, on the 2nd of August, the wife of a labourer, aged thirty-two years, 'cholera Asiatica, (thirteen hours.)' The medical attendant states:—'The patient was well at eight o'clock in the evening; was attacked at nine.'—At 45, Whittlebury-street, on the 3rd of August, the wife of a painter, aged thirty-eight years, 'cholera, (thirty hours.)' Mr. Matthews, the registrar, writes:—'No premonitory symptoms.'—At 2, Nelson-street, on the 5th of August, the wife of a shipwright, aged twenty-eight years, 'mania, (two hours,) cholera, (two days;)' which came on suddenly, (Dr. Richardson states,) without any previous warning.—At 4, Staple-street, Long-lane, on the 6th of August, the son of a journeyman hatter, aged three years, 'Asiatic cholera, (twelve hours,) not any previous diarrhoea.' The medical attendant adds upon his certificate:—'The premises at No. 4 are in a bad state; a cesspool immediately in front of the back-door; water-closet without pan, and a constant smell from it; the cesspool not in connexion with the common sewer. The adjacent houses in a similar condition.'—At 58, Lucas-street, on the 6th of August, the widow of a coachman, aged fifty-seven years, 'cholera (thirty-six hours.)' The certificate further adds, that there was no previous diarrhoea; the deceased had been to attend a friend at Stratford that had died of cholera on the 2nd instant.—At 26, Peter-street, on the 7th of August, the daughter of a workman in a foundry, aged two years, 'Asiatic cholera, (twenty-four hours,) no premonitory diarrhoea.' Second death in this house in two days. Child healthy, and ate heartily up to the time of the first death.—At 3, St. John's-terrace, on the 8th of August, a servant, aged seventeen years, 'Asiatic cholera (eleven hours.)' The medical attendant in this case states that 'the deceased, a servant, was taken ill in Guildford-street, Russell-square, and was removed to St. John's-terrace; that he had lived well, and had no premonitory diarrhoea.'—At 22, Everard-street, on the 9th of August, son of a mariner, aged four years, 'cholera, (five days,) no premonitory diarrhoea, secondary fever, (three days.)' Privies for two rows of houses run into a small drain, which is very frequently overcharged, when the yards are flooded with the contents. A second child ill, and the father recovering from an attack of cholera.—At 30, Mint-street, on the 9th of August, widow, age unknown, 'cholera, (twelve hours.)' Came from France a few days before, had walked fourteen miles on Tuesday, returned to her lodgings at four o'clock in the afternoon much exhausted, was immediately seized with cholera, and died between three and four o'clock next morning.—At 15, Smith's-arms-place, on the 11th of August, wife of a gunstocker, aged forty-eight years, 'cholera, (eleven hours,) no premonitory diarrhoea. No medical

attendant. As in the case of the painter, at the request of the deceased, no medical attendance was applied for, and she was subjected to similar nostrums. Her husband was in the country at the time."

In 1849, some 570 cases passed under the review of Dr. Hearn. He divides them into five classes, and remarks—"A fourth class of cases, about ten in number, was met with, in which there was no vomiting or purging, but cramps, great prostration, &c. In a fifth class of cases, numbering about the same as the last, the patients were seized suddenly, as if shot."—(p. 11.) Dr. Wilson, of Haslar,† thus writes—"Soon after eating a hearty meal, in perfect health, the subject has been obliged to be relieved from duty in the ranks or on deck, becoming in an instant faint and giddy, with a rush of fluid from the stomach and bowels, the features being collapsed, the pulse fluttering, and the surface, tongue, and breath cold. These cases," he adds, "were invariably more fatal than where there had been precursory diarrhoea." Bell‡ writes—"A man, in high health and spirits, accompanies his companions to bathe; he is seized while in the water with vomiting and purging or with spasm; is brought immediately to a surgeon, and is found in what I have called the second stage of the disease. Or a man goes to bed perfectly well, and is roused at three o'clock with a call to stool; animal heat has already failed, and in three hours he is dying." Mr. Lawson states that in 1849 he "attended upwards of 3000 cases of the severest species of diarrhoea without one becoming cholera," and that out of "upwards of 100 cases of genuine Asiatic cholera," not one had been preceded by diarrhoea.

Further evidence like the above might be here brought forward; sufficient, however, has been adduced to negative the apodictic law before laid down in the previous quotation respective of the diarrhoeal prodromata of cholera. That in this country the general rule is that such premonitions shall exist, is freely admitted. It appears also to be more universally so the case here than in India, particularly with the dark races. The reader, nevertheless, may be referred for a different view than we have taken, to Dr. Macdouglin's "Inquiry."§

Relative to the progress of cholera in the metropolis, we condense the following from the last "Weekly Return" of the Registrar-General (August 19th):—

Districts.	Elevation above water mark.	Population (1861).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	38
Central (St. Giles, &c.).....	49 "	393,256	32
Western (Kensington, &c.)	28 "	376,427	184
Eastern (Shoreditch, &c.)...	26 "	485,522	105
Southern (St. Saviour's, Lambeth, &c.) }	6 "	616,635	379.
			729

Of which number 214 were under 15 years of age.

426 " between 15 and 60.

86 " above 60.

The deaths from diarrhoea last week were 192.

The "Report" observes that the "cholera has prevailed with great irregularity over London, and that in several sub-districts the ravages of the epidemic are considerable. Imperfect drainage, proximity to the dirtiest parts of the Thames, bad water, and poverty are still, as they were in 1849, the chief circumstances that make cholera fatal. It is on the banks of the polluted Thames in the lower parts of the London basin that the people die in large numbers; for on ground not on an average 10 feet above the Trinity high-water mark, 1212 of the deaths from cholera have happened out of 595,119 people; while on the next terrace of 10 feet and under 40 feet of elevation, 493 in 648,619 have died; and on the higher grounds above St. James's-square and the Strand only 213 have died of cholera out of 1,070,372 inhabitants. The mortality at the three elevations, commencing at the lowest, has been at the rate of 204 and 76 and 20 to every 100,000 inhabitants. The people on the low grounds have suffered ten times as much as the people living on the grounds of a moderate elevation."

We have to announce with regret the death of Captain R.

F. Rowley, (1830,) which event lately took place at Woodlands, of cholera. The gallant officer was the fourth son of the late Admiral Sir Charles Rowley, Bart., G.C.B., G.C.H., and was a well-known and warm supporter of the different professional charities. We may also remark that, on Sunday morning a feeling of gloom prevailed in the congregation of St. John's Church, Notting-hill, in consequence of an announcement made by the senior curate, that the cholera had taken off the Rev. Edwin Proctor Dennis, B.C.L., the incumbent minister of the district. Notting-hill does not appear to have been visited with many severe cases of cholera; but, notwithstanding its reputed healthfulness, it is very liable to severe attacks, being situated immediately above the filthy Kensington potteries, so frequently made the subject of complaint in sanitary reports. Mr. Bryant, the proprietor of the well-known Horns Tavern, Kennington, has likewise been a victim to the disease.

The master of the ship *Lima*, of Dundee, which put into Falmouth with several cases of cholera on board, has published a letter, in which he states: "It appears to be my duty to strongly urge on the Government to adopt some immediate measures to provide for a similar case, (or cases,) should such again occur at this port, to arm the magistrates with sufficient authority (should they not already have it) to compel a proper location to be provided on shore; or the Admiralty should have here, and appropriate, a hulk for the reception of individuals who may from similar circumstances be driven into this port, and not that in such a benevolent country as England crews and passengers are to be left to their own fate, unassisted, to meet with and encounter so dire a foe as cholera."

At the Lambeth police-court, the magistrate has been informed that at all the station-houses of the L, or Lambeth division of police, an abundance of medicine is provided, and could be had there by all persons seized with premonitory symptoms of the disease.

Notwithstanding the remonstrances made in the public prints and in this journal, the doings at St. James's, Bermondsey, are as bad as ever. A correspondent writes,—“On Sunday morning last, a scene presented itself as the congregation came to church, unparalleled, I believe, in the annals of intramural interments. Although during the week as many as sixty-two burials had taken place in this ground, 10, thirty-eight open graves appeared yawning before us. In the afternoon, as the hour drew near for the funerals to be taken, no pen can describe the spectacle this churchyard presented. If a battle had been fought in our streets, and the slain inhabitants consigned to burial in the churchyards of their respective parishes, the slaughter must have been fearful indeed if the numbers to be brought here could have exceeded the aggregate burials of that eventful day.”

Accounts from Belfast of Saturday's date state, that since Tuesday last no fewer than thirteen cases of cholera, five of which proved fatal, have occurred in the small town of Antrim. Every exertion is being made by the inhabitants to stay the progress of the malady. There has been only one case of cholera reported in Lisburn during the week. The number of cases in the town since the first appearance of the epidemic has been 120, of which 50 proved fatal. It is also stated that the pestilence has shown itself in the town of Larne, and that during the last week four cases have appeared there.

The *Northern Whig* has the following on the progress of cholera in Belfast:—"We regret to state that this dreadful disease is not manifesting any evidence of cessation, but rather the reverse. Since Wednesday last, when 53 cases were reported as having occurred in Belfast during the preceding week, 47 new cases had taken place up to last evening. The type of the disease is very aggravated, death supervening in the proportion of 60 per cent. of those attacked, after periods varying from six hours to three days."

Mr. French (surgeon to the Infirmary of St. James', Westminster) has addressed the following observations to *The Times*:—"Twenty-two years since I pointed out the fact that cold water was useful in the treatment of cholera; at that time a general opinion existed that it was positively injurious. That prejudice has entirely disappeared, and there is now but one opinion—namely, that it is beneficial. I believe, however, that all the other prejudices to which I so long since directed attention are still entertained with all their original force. For example, it is still a prejudice to suppose that the use of astringents of any kind exert an influence on the cessation of epidemic diarrhoea; the fact being that their omission from any prescription will in no degree lessen its efficacy. It is still a prejudice to suppose that vomiting is an unfavourable symptom in the case of a patient with an imperceptible pulse; the fact being that vomiting directly tends to restore the circulation. It is still a prejudice to suppose that the stomach and bowels

‡ The Nature of Cholera Investigated. By John George French, F.R.C.S. London, 1864. Other authorities for the same are also given in this work.

§ Result of an Inquiry into the Invariable Existence of a Premonitory Diarrhoea in Cholera, in a series of Communications to the Registrar-General. London, 1864.

are suffering from irritation during cholera; the fact being that they are performing a serviceable eliminative function, for these organs are engaged in the office of throwing off a poison from the system, instead of supplying fresh material to the blood. Although ice is a very useful remedy in cholera for certain definite objects, I venture to predict that the opinion advanced as to the advantage of freezing the stomach and bowels of cholera patients will be of short duration; but I think it is much to be feared that the prejudices which I have named will continue to exist for at least another quarter of a century."

The *Dublin Evening Packet*, writing upon the "potato disease," has the following trite remarks, which another journal believes apply with equal force to the empiricism which prevails with regard to a more fearful visitation of Providence:—"As to remedies, all that is written on this subject is absolute nonsense, and founded upon notions of the disease purely empirical. The amount of information which has been acquired is just sufficient to show us that the causes of, and remedies against, this wonderful disease are alike inexplicable; and when applying supposed remedies we are, in fact, often doing a certain and defined amount of injury for the sake of a purely speculative advantage."

## THE WAR.

(FROM OUR SPECIAL CORRESPONDENT.)

VARNA, AUG. 8TH, 1854.

REPORT says that we march from this place in two or three days, in order to embark—for where I fancy but few know, though many persons, who say their information is correct, state it is to Sebastopol; but I believe it is quite certain we go to sea, and most probably do a little work this autumn—perhaps take Odessa or Anapa, and winter there; but I can give you no authentic information, as it is naturally kept very quiet. I hardly think Sebastopol, as we have talked so much about it of late, and though it has been said that it was quite determined upon, it may be a blind for the Russians, who seem to have heard of it, as some of our ships have arrived at Varna, and reported that about 10,000 men were seen throwing up entrenchments on the plains of Sebastopol. This is to-day's news, (8th.) Now I come to the health of the men, which I am sorry to say is bad. The Heavy Brigade have about 100 sick in each regiment—that is, counting convalescents who still attend hospital. Many deaths have occurred from cholera. The Grenadier Guards seem to have suffered the most; they have had about twenty-five deaths; Fusiliers about ten or twelve; Coldstreams about the same; and now the Highlanders are coming in for their share. Calomel, opium, mustard emetics and sinapisms, are the remedies chiefly used; but some of the cases are very rapid and sudden; others last for twenty-four hours and upwards, and baffle all the remedies. Some of the cases recover from their state of collapse, and give you great hope; but soon fever of a typhoid character seizes and carries them off. There have been many cases of fever, both simple and typhoid, in camp, and a few deaths, but intermittent is rare as yet.

Captain Levinge, H. Artillery, is dead—it is said from an overdose of laudanum. He was very ill, and requested his servant to pour some out for him, which he did, and it proved fatal; some say it was in the dark. Assist.-Surg. Blenkins, Grenadier Guards, returns home ill, having had intermittent fever—a great loss on account of his anatomical knowledge, and in the hospital he would have been of great service as an operator. The other divisions, the 2nd and the Light, have and are still suffering a good deal more than the Heavy Brigade, cholera being the enemy. Report says that the 50th Regiment have 300 in hospital, but I cannot vouch for the correctness of the statement. These last two or three days, there is an apparent improvement in the men, both in their spirits and health. All seemed at one time to be very low on account of sickness, but now they have heard there is a chance of a movement against the Russians, all have put on a bright face, except, of course, the poor fellows in hospital, who are very ill.

They do say, before now the cholera was not known here, but in 1828 the Russians lost in the valley close to Varna some thousands from fever and plague; hence it is called the Valley of the Plague. We are on the top of a hill, looking down upon this valley, having a lake running up for about fifteen miles along it. The loss of the French has been most frightful from the same disease. The expedition of about 7000 men that went up to Vrus-badji they say lost 1700 men. When they got there, they found the water poisoned with

animal matter, no doubt placed there by the Russians. Coming from there, they say 400 died on board one steamer, from cholera. I tell you this as I have just heard it from Varna. Some of the ships have returned with the bad news. These reports cannot be believed, but there is no doubt there has been great loss amongst them. The surgeons here have a good deal to do now, both day and night work, but I have not heard of a very great many being laid up. Dr. Mackenzie, of Edinburgh, is here, seeing what is to be seen. He went up to see the wounded at Silistria, but gained no information, and found the poor Turks much neglected, and their medical men very ignorant. Many patients died where an operation would have saved them, in all human probability. The second time he went up he sprained his ankle, and returned, as he could not proceed.

It is very hot now. They say this is the warmest month. Thermometer in tent averages from 91° to 96°. The nights vary—sometimes very hot, at other times very cold, and generally a very heavy dew. We must expect a good deal of sickness now the unhealthy months have set in, and it must be recollected how long the men have been in tent, and since they have left England have not laid on a bed—merely have had their cloaks and blankets. For the sick, palliasses have been obtained.

DISEASE AMONGST THE TROOPS IN THE EAST.—The cholera still continues its ravages, but I rejoice to say that the virulence of the cases is on the decline. Up to the present date the British army has lost about 260 men from this fatal disease. Of these deaths about 100 were in the Light Division. Since the movement of our camp out to Monastir, the division has become healthier. Our troops are at present losing 30 men a day. Amongst the victims to the Devna pestilence were Dr. Jenkins, 23rd Regiment; Mr. Newberry, Rifle Brigade; and Captain (Major) Levinge, R.H.A. The French losses from cholera are frightful. The disease is not much on the wane amongst them, and there are divisions in which they die at the rate of 70 and 80 a day. In the French general hospital, since the 14th of July, 720 men have died of cholera, and only 78 men have been sent out cured. Convinced that there is something radically wrong in the air of the place, the French are clearing out of the hospital altogether to-day, and will henceforth treat their cases in the field. The hospital was formerly used as a Turkish barrack. It is a huge quadrangular building, like the barracks at Scutari, with a courtyard in the centre. The sides of the square are about 150 feet long, and each of them contains three floors, consisting of spacious corridors, with numerous rooms off them of fair height and good proportions. About one-third of the building is reserved for our use; the remainder was occupied by the French. Although not very old, the building is far from being in thorough repair. The windows are broken, the walls in parts are cracked and shaky, and the floors are mouldering and rotten. Since the sickness broke out, it has been perceived that there is something or other radically unwholesome about this building. Like all places which have been inhabited by Turkish soldiers for any time, the smell of the buildings is abominable. Men sent in there with fevers and other disorders were frequently attacked with the cholera in its worst form, and died with unusual rapidity, in spite of all that could be done to save them. The French have become so persuaded of this, that they are, as I have said, taking to the field in preference to this pest-house. I rode up there at twelve o'clock the other night for medicine for an officer, a friend of mine, who was taken suddenly ill in the evening. Along two sides of the hospital was drawn up a long train of araba carts, and by the moonlight I could see that some of them were filled with sick soldiers. I counted thirty-five carts, with three or four men in each. These were sick French soldiers sent in from the camps, and waiting till room could be found for them in the hospital. One of the medical gentlemen in attendance, who was just going to his quarters for the night, was kind enough to come with me to see my sick friend, and I had an opportunity of seeing the miserable way in which the surgical staff were lodged. They are penned up, two or three together, in small unfurnished rooms, open to every wind that blows through wall, floor, ceiling, and window. Some of these gentlemen have no rooms at all, and one I know sleeps in a passage.—*The "Times" Correspondent, Varna, Aug. 9th.*

FRENCH GOVERNMENT SANITARY INSPECTOR.—Dr. Melson, Member of the Academy of Medicine and the Board of Health, has been nominated by Government to be Sanitary Inspector at Marseilles.

## Medical News.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, August 17th, 1854.

NORTON, ALGERNON CHARLES WODEHOUSE, Monmouth-road, Bayswater.

WILLIAMS, EVAN PIERCE, Denbigh.

**UNIVERSITY OF LONDON.**—The following is a list of the candidates who lately passed the first examination for the degree of M.B.:—First division: Edwyn Andrew, University College; James Gibbs Blake, B.A., University College; Uriah Perrin Brodribb, B.A., Guy's Hospital; Thomas Buzzard, King's College; Edward Clapton, St. Thomas's Hospital; Geo. Giles Corbould, Bristol, and King's College; Samuel Giles, B.A., Guy's Hospital; John Bake Husband, Middlesex Hospital; William Tiffin Iliff, Guy's Hospital; Alexander Robert Kilroy, London Hospital; Henry Maudsley, University College; Wm. Newman, St. Bartholomew's Hospital; John Lumsden Propert, King's College; Walter Barnett Ramsbotham, University College; John Charles Thorowgood, University College; William Turner, St. Bartholomew's Hospital; Thomas Stick Veale, University College; James Fitzjames West, St. Thomas's Hospital. —Second division: Francis Thomas Bond, B.A., Queen's College, Birmingham; Michael Castaneda, University College; Francis Winter Clarke, Middlesex Hospital; Charles James Devonshire, Francis Joseph Dowling, Christopher Heath, Jas. Rice, William Sims, King's College; William Skinner, St. Thomas's Hospital; Robert Masters Theobald, M.A. Glasg., University College.

**CHATHAM-STREET SCHOOL OF MEDICINE, MANCHESTER.**—The examinations of the students for the session 1853 and 1854, were concluded on Thursday, the 17th instant, when the following scholarships, prizes, and certificates of merit, were awarded to the undermentioned students:—*Scholarships*: For second year's students, Mr. Thomas Platt, Longsight; for first year's students, Mr. Herbert S. Renshaw, Ashton-upon-Mersey. *Prizes*—*Medicine and Pathology*: Lecturer, Dr. Thomas H. Watts—Junior class, first prize, Mr. William Sellers, Bury; second prize, Mr. Edward H. Pitman, Eastbourne, Sussex; Mr. Thomas B. Bott, Bury, merit equal.—*Surgery*: Lecturer, Mr. Southam—Junior class, first prize, Mr. E. H. Pitman, Eastbourne; second prize, Mr. W. Sellers, Bury.—*Anatomy and Physiology*: Lecturers, Mr. Dumville, Messrs. J. S. and J. O. Fletcher, and Mr. Murphy—Prize for second year's students, Mr. Thomas Platt, Longsight; prize for first year's students, 1st, Mr. H. S. Renshaw, Ashton-upon-Mersey; 2nd, Mr. Wm. Clare, Ashton-under-Lyne.—*Chemistry*: Lecturer, Mr. Stone—Prize, Mr. Henry Reddrop, Warminster.—*Practical Chemistry*: Lecturer, Mr. Stone—Prize, Mr. E. H. Pitman, Eastbourne, Sussex.—*Obstetric Medicine*: Lecturers, Dr. Whitehead, Dr. Merei—Senior prize, Mr. Thomas B. Bott, Bury; junior prize, Mr. Christopher Sharp, Farnworth.—*Materia Medica*: Lecturer, Mr. Somers—Prize, Mr. Walter J. Winn, Manchester, Mr. H. S. Renshaw, Ashton-upon-Mersey, merit equal.—*Forensic Medicine*: Lecturer, Dr. Aikenhead—Prize, Mr. E. H. Pitman, Eastbourne, Sussex.—*Botany*: Lecturer, Dr. Joseph Stone—Prize, Mr. H. S. Renshaw, Ashton-upon-Mersey. —Practical Botany, prize, Mr. Alfred Gallemore, Manchester.—*Certificates of Merit*—*General Proficiency*: Mr. Wm. Sellers, second year's student; Mr. Walter H. Winn, first year's student.—*Medicine*: Mr. Thomas Platt, second year's student.—*Surgery*: Mr. J. Lord, third year's student; Mr. A. Gallemore, second year's student.—*Anatomy and Physiology*: Mr. William Sellers, second year's student; Mr. E. Monks, Mr. Christopher Sharp, Mr. Charles Murray, Mr. Walter H. Winn, first year's students.—*Practical Anatomy*: Mr. W. Sellers, Mr. T. Platt, Mr. E. H. Pitman, Mr. J. Lord, Mr. T. B. Bott, Mr. H. Quarmby, senior class; Mr. William Clare, Mr. H. S. Renshaw, Mr. Charles Murray, Mr. W. H. Winn, Mr. E. Monks, junior class.—*Chemistry*: Mr. W. Clare.—*Botany*: Mr. C. Sharp.—*Forensic Medicine*: Mr. W. Sellers.—*Materia Medica*: Mr. C. Sharp.—*Obstetric Medicine*: Mr. Thomas Platt, senior class; Mr. H. S. Renshaw, junior class.

**GLASGOW. — CHOLERA: ERRONEOUS STATISTICS.**—A letter from the Secretary to the Board of Health in London, calling attention to a statement by Dr. Gavin as to the great mortality which had occurred in the Cholera Hospital of Glasgow, was laid before a late meeting here. In his Report on the subject of cholera, Dr. Gavin stated that "In one central, large, well-arranged hospital in Glasgow, the mortality was greatly in

excess of that occurring amongst the sick who were treated at their own houses. Out of 130 patients," he said, "admitted into this hospital, no fewer than 115 died." Mr. Hall explained, in the absence of Mr. Adamson, that he had replied to the above statement, to the effect, that "hospital treatment in this parish is never resorted to in cholera cases when the patients can be treated in their own houses." At the same time, the figures quoted from Dr. Gavin's Report did not appear to be correct, for out of 502 patients treated in the cholera hospital, only 162 had died, being at the rate of 32 per cent. On the motion of Mr. Ross, the Board unanimously approved of the course taken by Mr. Hall in order to correct the erroneous statistics of Dr. Gavin.

*The District Surgeons.*—Some conversation arose upon the reading of a letter from the law agents of Dr. Lindsay, one of the district surgeons, who had declined to accept a gratuity of £25 in consideration of extra services performed during cholera, including Dr. Lindsay's bill of charges against the Board for attendance on 296 patients, amounting to £141 5s. 6d. The result was a motion made by the chairman, and agreed to, that Dr. Lindsay's services should be dispensed with; and it was remitted to the committee to take such steps as were necessary to appoint a successor. Any further proceedings to be referred to the Inspector's Committee.

\*. The estimation in which the profession is held by certain parties in Glasgow, may be judged of by the above proceeding. Twenty-five pounds for attendance upon 296 cholera patients!

**THE CHOLERA IN PARIS.**—On Aug. 16th, the deaths from cholera in the hospitals amounted to 26, and 49 new cases were admitted on the same day. On the 15th, there were 24 deaths and 47 new cases; and on the 14th, 31 deaths and 69 new cases. Since the beginning of the epidemic in Paris, (November, 1853,) 4884 cases were treated in the different hospitals: of these, 1862 recovered, 2508 died, and 514 were under treatment on Aug. 16th. The mortality in town thus had a tendency to reach 100 a day, but the authorities do not publish lists, so that the returns cannot be entirely relied upon. Out of the 86 departments of which France is composed, 84 have been visited by the scourge; Marseilles was, however, the worst treated, as the deaths have amounted to several hundred a day. The inhabitants fled for the most part, so that this number is really enormous. The disease is, however, on the decline in Marseilles, for on the 5th of August there were no more than 29 deaths per diem. The mortality of the present moment may be reckoned for the whole of France at 800 deaths a day, and it is computed that from November, 1853, about 20,000 persons have died from cholera over the whole territory of the kingdom. The character of this epidemic is strikingly analogous to that of former visitations, (1832 and 1849;) and the localities then spared have this time likewise been free. Amongst these Versailles and Lyons may be mentioned, where not one case of cholera has taken place, either in 1832, 1849, or 1854. In Paris the disease is declining, and hospital physicians are noticing that the remedies used seem to have more efficacy than heretofore.

**QUACKERY AT THE ANTIPODES.**—The love of quackery—the pleasure of being cheated—appears to be the same all the world over. In Australia there is the same pig-headed advocacy of unqualified medical practitioners as in the centre of the British empire. In the *Adelaide Observer* we notice a correspondence on the subject of an inquest at Thebarton, South Australia, from which it appears that a Mr. Scammell, who by his own admission "had no diploma under any medical or surgical college," figures in the colony as a practitioner, whom certain inhabitants of certain places there not only employ, but whom they are generous enough to puff by testimonial advertisements in the newspapers. One correspondent writes, that he considers the said Mr. Scammell "in every professional sense but a mere form a qualified medical man." We are glad, however, to perceive that the colonial press entertains more sound and healthy opinions. The *Adelaide Observer* remarks:—"We had it in evidence that the gentleman who had mistaken the nature of Handking's disease, and treated him wrongly, was not a licensed or qualified practitioner, and that he had only received a partial and fragmentary professional education. We are glad to hear that Mr. Scammell is an estimable man, and of gentlemanly manners; but however agreeable this may make him in society, it is, in critical cases of disease, not the right evidence of professional skill. It is necessary for the protection of the public, and but just to those who have incurred the toil and expense of a scientific and professional education, that the practice of medicine by unqualified persons should be discouraged. Doubtless a rigid enforcement of this rule may occasionally be productive of individual hard-

ship, but its neglect would involve much more general hardship, and be really the most cruel in the end."

**BLOOMSBURY DISPENSARY.**—Mr. Thomas Chaplin, Resident Medical Officer, informs us, just before our going to press, "that during the week ending August 22nd, fifty-four new cases of diarrhoea have occurred. In some the attack was very severe, but all have terminated favourably under the plan of treatment described by Dr. Pidduck, (the physician to the Dispensary,) in *THE LANCET* of last week. One case in which true cholera symptoms manifested themselves was treated with the saline powders, and is now doing well. No other case of cholera has occurred."

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, AUG. 19.**—The number of deaths from all causes returned for the week that ended last Saturday was 1832. Cholera was fatal last week to 729 persons. In the six weeks of its present appearance, the deaths from cholera have been successively 5, 26, 133, 399, 644, and 729. The deaths from diarrhoea were 192.

### Obituary.

At Hylten Ferry, near Sunderland, very suddenly, on the 13th, deeply regretted and respected by a large circle of friends, in his thirty-second year, **ROBERT ROBSON NOBLE, M.R.C.S.**

Suddenly, while on his way from George Town to Portland, Australia, **PATRICK GERARD ROBERTSON, M.D.**, son of Major Robertson, of Kindeare, Rosshire.

### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under..... £0 4 6 | For half a page ..... £2 12 0  
For every additional line ... 0 0 6 | For a page ..... 5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... .. £1 14 8  
Six Months... .. 0 17 6  
Three Months ... .. 0 8 8

To be paid in Advance.

Post-office Orders to be addressed to **EDWARD THOMAS, THE LANCET OFFICE, 423, Strand, London**, and made payable to him at the Strand Post Office.

### The BRITISH MEDICAL DIRECTORY for 1855.

ALL duly-qualified Medical Practitioners are respectfully requested to forward, as soon as possible, their "ENTRIES" or "RETURNS" for this Annual Volume. References to the Entries in the Directory for the current year, (1854,) stating that they are correct, will be sufficient. When alterations are required, they should be distinctly specified, and in all cases the names of the writers should be written clearly, and at full length.

Address to the Editors at the "BRITISH MEDICAL DIRECTORY" Office, 423, Strand.

### TO CORRESPONDENTS.

**F.R.S., &c.**—Many thanks for the suggestions and observations as to the management of the Norfolk County Lunatic Asylum. As regards St. Luke's Hospital for the Insane, we can only say at present that our attention has been actively directed towards the condition of this institution. Since, however, the committee have suggested certain important alterations and improvements, and amongst other points have determined, we believe, upon making their resident medical officer general superintendent of the whole establishment, we have waited to see these necessary changes fully and fairly carried out. Should there be any difficulty, or should the contemplated improvements be long delayed, we shall certainly draw public attention to the matter. There is, doubtless, much that will not bear looking into; but as our object is to improve the condition of the insane for the future, we must be content to overlook much that is past.

**A. P.**—We cannot recommend the work in question. Consult any respectable surgeon. The disease is quite under the control of remedies. *Devoiensis* shall receive a private note. The MS. arrived safely.

**Y. Z., Mr. Andrew Bolton, &c.**—The "New Vaccination Bill" amendments were rejected by the House of Lords; consequently the munificent payment of one shilling to medical gentlemen, not appointed by the guardians, for every successful case of vaccination will not be paid. The Act altogether is a complete failure, and in its main clauses most unjust and offensive to the great mass of the profession. It is true that Lord Lyttelton proposed "the shilling" for the "signing of the certificate;" but this was only a left-handed way of paying for the operation also!

**Mr. Gimwood** will receive a private note.

**Scribblers.**—The entire subject of gratuitous advice is one of the utmost importance to the medical profession. Nothing has been done in the matter by the "committee," though they talked a good deal upon the subject. Some good resolutions, issued by the medical practitioners of Colchester, will be published in the next *LANCET*. The profession is annually robbed of thousands by the abuse of gratuitous advice.

**Vide et Crede.**—Has Dr. Puttenger's handbill been forwarded to the Manchester Medical-Biological Association? We may, perhaps, notice the subject. **Anxious.**—On examination, we cannot find the name in the *BARNESE MEDICAL DIRECTORY*.

**Vaccinator.**—In a case in which a child is brought to the surgery of a medical practitioner to be vaccinated, he is only entitled to the one shilling and sixpenny fee, however distant the residence of the child may be.

**A Subscriber.**—The three years, we believe, may be passed at Marischal College.

### ROYAL MATERNITY CHARITY.

To the Editor of *THE LANCET*.

SIR,—Certain cases have lately come under my observation, enabling me to form some judgment as to the management of the Royal Maternity Charity; and although I feel a great disinclination to call in question the conduct of others, yet, after reading the observations upon this institution contained in your last number, I cannot feel satisfied with myself without taking some means of making known the few following particulars of a case, which I think may be taken as a specimen of the working of this Charity at the present time:—

I was called about five weeks since to attend a poor woman residing in this neighbourhood, and suffering from uterine hæmorrhage; she was in the last month of pregnancy, and had obtained a letter from the Royal Maternity Charity; but as she understood that this did not entitle her to any medical attendance until labour commenced, she applied to me.

After a few days' treatment, the hæmorrhage subsided, and my visits were discontinued; but considering it a grave symptom as regarded her approaching partus, I gave a recommendation to her friends, and also to the Maternity midwife, who appeared anxious about the patient, that, in case any difficulties should arise when labour came on, to lose no time in calling for medical assistance. A few days elapsed, and I was somewhat surprised one night to receive from our relieving-officer a parish order, marked "urgent," to attend the same patient. I found that she had been in labour more than twenty-four hours, the Maternity midwife having been in attendance from the first, but had not been able to obtain any medical aid from the Charity, although the husband had applied, by the midwife's direction, six hours previously, and had made several other applications since. At last the midwife advised them to seek a workhouse order for my attendance, thinking, as she told me herself, that as it was late, no one would come from the Charity. I proceeded in due course to deliver the woman, the difficulties being very much increased by the delay this had occasioned.

Upon calling next day, I found that no medical man had been from the Maternity to see her, and none called, I believe, till after her death, which took place on the ninth day, from puerperal fever.

Had not this poor creature depended upon the Maternity letter, she would doubtless have made some other and better provision for her "hour of trial;" at least, as a *dernier resort*, she would have been prepared with a parish order, in which case the same assistance which she received at last, when the case had become difficult and dangerous, would have been afforded her at an earlier period, when it was comparatively safe and easy. And who knows what influence this might not have had upon the ultimate result of the case? Thus what was intended for a benefit proved to be a positive injury.

In the letter from the Secretary of the Royal Maternity Charity, published in *THE LANCET* of the 5th instant, it was stated, that in consequence of the efficient "system" of this Charity, a less mortality had occurred, in proportion to the number of cases, than under any other system adopted by any similar institution.

In reference to this, I may observe that I know of cases attended from this Charity, in which formidable diseases have followed labour—diseases arising out of the puerperal condition; and these cases have, when in a very dangerous state, been discarded as patients of the Maternity Charity, and fallen into my hands in my capacity of union surgeon, and these patients were given to understand that they would not receive any further medical assistance from the Charity after the ninth day.

Now, as in all fatal cases of disease connected with childbirth a large proportion of deaths would take place after the ninth day, it is not to be wondered at that, according to this "system," a less proportion of fatal cases take place under the treatment of the Royal Maternity Charity than under any other system adopted by any similar institution.

I am, Sir, your obedient servant,

W. BENEDICT HART,  
District Surgeon, Whitechapel Union.

August, 1854.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Mr. Oritchett; Dr. Ranko; Mr. J. H. Bolton; Mr. W. Walker; N.; Mr. L. F. Crumme; Dr. Rothman; Mr. R. Howden; Mr. A. Rotton; Mr. J. C. Pigg; Mr. Francis Ward; A Subscriber; Anxious; Vide et Crede; Mr. R. B. Marriott; Mr. G. D. Nelson; Mr. Hopley; Mr. S. Knaggs; Mr. Walter Scott; Delta; Medicus; F.R.S.; Devoniansis; Mr. Hansard, (with enclosure); Mr. Thomas, (Kirkdale, Liverpool); Mr. Vaudin; Mr. Tucker; Queen's College, (Birmingham); Y. Z.; Mr. J. W. Morley; Mr. A. Bolton, (Newcastle); A Medical Officer, (Madras); Mr. Pritchett, (Grimsby); Mr. G. Hind; J. A., (Newcastle-on-Tyne); Vaccinator; Mr. Aulsebrook, (Hawwell); A. X., (Banbury); A Country Surgeon; A. O. Y., (with enclosure); Mr. F. Nuttall, (Bury, with enclosure); Mr. J. Godden, (Oxton, with enclosure); Dr. Castle, (Leeds, with enclosure); Mr. G. Garson, (Stromness, with enclosure); Scribblers; &c. &c.

**GOLD CHAINS AND JEWELLERY.—PRIZE MEDAL.**

**W**atherston and Brogden's Gold Chains, by troy weight, at realizable value, and the workmanship at wholesale manufacturer's prices.—The Great Exhibition having established the advantage of purchasing from the wholesale manufacturer wherever it can be accomplished, and thereby dispensing with an intermediate profit, WATHERSTON and BROGDEN beg to announce that, in obedience to the numerous calls made upon them, they have thrown open their Manufactory to the public at the same prices they have been in the habit (for the last half century) of charging to the trade in London, India, and the Colonies. The system of weighing chains against sovereigns being one of the greatest frauds ever practised on the public, WATHERSTON and BROGDEN guarantee the gold in their chains, and will repurchase it at the price charged,—the workmanship, according to the intricacy or simplicity of the pattern. Example:—Intrinsic value of a chain of 15 carat gold, weighing 1½ ounce, £3 19s. 7d.; supposing the workmanship to be £2—total, £5 19s. 7d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery all made at their Manufactory, 16, HENRIETTA-STREET, COVENT-GARDEN.—Established A.D. 1798.

**CAUTION.**

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

**Mr. Bourjeaud**, in submitting the above four Engravings as illustrating the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaud wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spiral Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

**India-rubber Urinals for Male and FEMALE RAILWAY TRAVELLERS AND INVALIDS.**

No. 1.

No. 2.

URINAL FOR BED USE.  
Price 15s., 18s., and 21s.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 11½, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

**Darby and Gosden beg to call**

the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.

140, LEADENHALL-STREET, CITY.

TO THE SURGICAL AND MEDICAL PROFESSION.

**W. F. Durroch, late Smith, begs to**

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas'-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Durroch, for John Hilton, Esq., may be had at a moderate price.

**Every excellence which the**

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street, late 6, Vere-street, Oxford-street.

## Purification of Linen—Prevention of

Disease.—J. BOLLESVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Bollesve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy; I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Bollesve, Esq.

J. PALFREMAN, House Steward.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOLLESVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Highfield, Berkhamstead, Herts., January 24th, 1854.

SIR,—I read some time ago in your valuable paper, an article advocating the need in this climate of warming dwellings with some simple apparatus, giving ventilation, combined with the healthiest temperature, at a great saving of fuel. I am very glad to give you the result of my experience of a new kind of stove, named "Calorifere," erected some months ago at this residence by Mr. J. Bollesve, London; it answers its purpose perfectly; the house and every room to which the ventilation is adapted, is kept at an agreeable temperature, with an utter absence of the oppressive atmosphere usually experienced by all other methods of warming dwellings; that I have seen several persons, some of them highly scientific, who have examined the apparatus and have expressed themselves satisfied, and consider it a most perfect application of warm air and ventilation combined. The cost of warming the house and conservatory attached, has been *Eightpence per twenty-four hours*, during the late cold weather, and the trouble of attendance is very little. The economy of fuel will cause this stove to be generally adopted, I have no doubt, more especially as the charge for coals is constantly on the increase. The stove in operation should be seen to be appreciated, and I can add, from my experience of its effects during this winter, that it is invaluable for any invalid in so variable a climate as ours, and no one can be aware of the comfort until it is tried.

I am, Sir, yours obediently, a Subscriber,

The Editor of the Times.

E. W. FERNIE.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

FIG. 1. MR. BOURJEAUD'S NEW BELT AND AIR-PAD FOR INGUINAL HERNIA.—Mr. Bourjeaud begs to state that the smaller ends of the pyriform air-pads are seen below the inferior margin of the belt. The latter is made of elastic strips, about one inch in breadth, which, by being sewn together in a peculiar manner, effect an equable compression around the abdomen. On the internal and front part of the belt two air-pads are attached, exactly on the spot where the belt comes in contact with the inguinal rings; and these yielding pads exercise a gentle compression upon the rings, which compression may be increased or diminished in changing, by means of a small tube and stopcock, the quantity of air contained in the pads. This apparatus is now driving the steel springs completely out of the field; and Mr. Bourjeaud is happy to say that the hernia belt is getting more and more a favourite among the leading surgeons of the metropolis and the provinces. It is plain to all, that two ends should be kept in view as to apparatus for hernia: first, the support of the intestinal mass; and, secondly, prevention of protrusion through the rings, without giving the patient pain, or causing inflammation and gangrene by pressure on the abdominal parietes with unyielding steel springs. These generally acknowledged desiderata the new belt for hernia completely satisfies; and it becomes every practitioner's duty to advise its use to such of his patients who are affected with hernia.

FIG. 2. POSTERIOR VIEW OF THE HERNIA BELT AND AIR-PAD.—This diagram has been drawn in order to illustrate the latest improvement Mr. Bourjeaud has introduced touching this extremely useful apparatus. It had, namely, been found that, in the sitting posture, the pressure of the air-pads upon the inguinal rings became somewhat weaker; to guard against this change, the tubing attached to the lower margin of the belt and terminating in the air-pad, has been made to swell towards its centre, posteriorly. When the patient sits down, he drives the air contained in this kind of reservoir into the air-pad in front; the latter becomes a little larger, and the slight difference alluded to above is compensated without any effort on the part of the patient. This contrivance gives to the hernia belt a most valuable accuracy.

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## New Urethrotome, by Mr. Ure,

Surgeon of St. Mary's Hospital, described in THE LANCET of June 10th, —Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

## Heeps, (16a, Liverpool-street,

Bishopsgate-street, late of 46a,) Inventor of the ELASTIC SPRING BANDAGE and ABDOMINAL SUPPORTER, for Prolapsus Uteri and Ani.

Mrs. H. begs to call the attention of the Profession to these Supporters, which have been in use for the last twenty-five years. They derive their entire bearing from the shoulders, and have enabled numerous sufferers to carry on the daily avocations of life with ease and comfort, when others have proved ineffectual. Testimonials from many of the most eminent physicians may be forwarded by post. The prices of these are within the means of all classes, being from 6s. to 35s. An allowance made to hospitals, &c.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of DUDLY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam EXNER (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## Meinig's Electro-Generator,

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, interrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s. 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, £3 3s.

103, LEADENHALL-STREET, and 213A, PICCADILLY.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and Co., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Aerated Waters, and Patentees of the Syphon Vase and Valvular Stopped Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking aerated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons.  
Recommended by BARON LIEBIG.  
Address, HARRINGTON PARKER and CO., 53, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**  
per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per  
dozen quarts; delivered free within four miles. Merchants supplied with  
Pale Ale and Porter for exportation at the lowest prices.  
WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**  
men who recommend this ale as an article of diet to their patients are  
respectfully requested to inform them at the same time, that they may rely on  
procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or  
bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer  
merchant, 132, Upper Thames-street.  
The Beers are warranted the products of Malt and Hops, and the consti-  
tuents of pure water, and not any other ingredient, organic or inorganic, as  
per analysis of Professor Thomas Graham, F.R.S., University College,  
London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal Col-  
lege of Chemistry, and of the Analytical Sanitary Commission, published in  
THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS,  
EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHA-  
NIEL EASTTY, 132, Upper Thames-street, London.

**Good Cyder, a Preventive of Cholera.**  
(See THE LANCET, 15th of July, p. 33.)

This refreshing and wholesome beverage may be obtained PURE, and in the  
highest perfection, of WRIGHT and COOKMAN, Devonshire-wharf, Bankside,  
London, whose stocks are warranted the produce of the finest orchards in the  
best cyder districts of Devon, and made only from the choicest picked fruit.  
A three dozen hamper of their celebrated pale Champagne Cyder, delivered to  
any railway station in London, for 32 shillings.  
Wine Merchants and Victuallers supplied on liberal terms.

**George Hanson's Sparkling Hop**  
CHAMPAGNE, Quarts 18s., Pints, 12s., Sparkling Nectar, 8s., bottles  
included; Hampers, 1s.

This new and exhilarating beverage, possessing the fine aroma and pure  
tonic properties of the Hop, with all the brilliancy of the foreign Champagne,  
stands unrivalled as a luncheon and dinner luxury. To Invalids it is invalu-  
able, and can be taken without affecting the head—its habitual use assisting  
the digestion.

To Merchants and Captains it will be found an excellent article for Export  
—to Passengers in sea-sickness this restorative will be highly appreciated—it  
will be found a cool and refreshing drink at the Mess Table—and in Warm  
Climates most desirable.

G. H. has the greatest confidence in recommending the above, and the  
demand, which its excellence has created, is sufficient guarantee of its  
quality.

May be had at most of the Taverns and Refreshment Rooms in the neigh-  
bourhood of the Crystal Palace.

Sold Wholesale, Retail, and for Exportation, by the Manufacturer, GEORGE  
HANSON, 3s, Clement's-lane, Lombard-street, City.

**To Invalids and those desirous of**  
PRESERVING HEALTH.—The Sanitary Commission instituted by  
THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place,  
Oxford-street, to be "entirely free from deleterious admixture," the attention  
of the public is directed to EDMONDS and CO.'S HOMEOPATHIC  
COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**  
in the best possible manner.—Our PURE GRANULATED COCOA was  
pronounced by the Analytical Chemists employed by THE LANCET, in their  
memorable researches into the Adulterations of the Food of the People, to be  
free from any admixture whatever. The Invalid, and Cocoa-drinkers in  
general, are requested to make trial of it. In pound packets, 1s. each.  
Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s.  
per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d.  
per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin  
cans, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee,  
a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very  
excellent ditto, 3s. 4d. Orders to the amount of 40s. for any of the above  
articles, covering a remittance for amount of same, forwarded, carriage free,  
to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

**H. Sparrow and Co. beg to announce**  
that in consequence of the late reduction of duty, and the present  
depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 8d.

With every other article in the trade proportionately cheap, and of that  
sterling quality for which they have been celebrated for the last Twenty  
Years; a price-list of which may be had on application, post free, and  
parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea,  
372, Oxford-street, London.

**Soyer's Aromatic Mustard.—"M.**  
Soyer has just brought out a New Mustard, which possesses a most  
beautiful bouquet; and which is entirely free from adulteration."—THE  
LANCET.

Sole Agents: Messrs. Crosse and BLACKWELL, 21, Soho-square, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**

superior Barley Water in Fifteen Minutes, has not only obtained the  
Patronage of Her Majesty and the Royal Family, but has become of general  
use to every class of the community, and is acknowledged to stand unrivalled  
as an eminently pure, nutritious, and light Food for Infants, Children, and  
Invalids; much approved for making a delicious Custard Pudding, and excel-  
lent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed  
for making a superior Gruel in Fifteen Minutes,—light for supper,—and alter-  
nately with the Patent Barley is an excellent Food for Children and Invalids,  
being particularly recommended by the Faculty as the purest and best Prepa-  
ration of the kind extant, and far preferable to the Emblen Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE & Co., Purveyors  
to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country,  
in Packets of 6d., and 1s., and in Family Cansisters at 2s., 5s., and 10s. each.

**Do you bruise your Oats yet?—New**

Out-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles,  
£2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—  
One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

DOUBLE PATENT.

**Brier's portable Gazogene,**

OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-  
beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the  
same, cheaper and more effective than any other  
preparation.

SELTZER POWDERS, prepared from a recent  
analysis of the fresh water from the spring by a cele-  
brated German chemist.

PATENT REFRIGERATOR, or Gazogene-Cooler

PATENT PORTABLE FILTER, a cheap and  
useful article, not occupying more than four to six  
inches in space, and filtering from six to ten gallons  
per twenty-four hours, suitable for Military, Navy, and  
Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN  
and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be  
adopted against all parties selling or exposing for sale  
the imitations of the above-named articles, as the said  
imitations are infringements upon these patents.

**School of Anatomy and Medicine,**

adjoining St. George's Hospital.—The WINTER SESSION will  
commence on Monday, October 2, 1854.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by  
Mr. Lane.

Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.

Chemistry—Mr. J. E. D. Rodgers.

Medicine—Dr. Cormack and Dr. Ballard.

Surgery—Mr. Pilcher and Mr. Spencer Wells.

Midwifery—Mr. Bloxam.

Materia Medica—Dr. Ballard.

Forensic Medicine—Dr. B. W. Richardson.

Botany—Dr. Lankester.

Practical Chemistry—Mr. J. E. D. Rodgers and Dr. Marcet.

Comparative Anatomy and Zoology—Mr. R. T. Hume.

For further particulars and prospectuses, apply to Dr. Lankester, 22, Old  
Burlington-street; Mr. R. W. Burford, at the School, 1, Grosvenor-place; or at  
the residences of the respective Lecturers.

**St. George's Hospital Medical School,**

LONDON.—SESSION, 1854-55.

THE WINTER COURSE OF INSTRUCTION will commence on Monday,  
October 2nd, when the SCHOLARSHIPS and PRIZES for the past year will  
be awarded.

The Hospital contains 350 beds. Attendance of the Physicians and Sur-  
geons daily, at One o'clock. Surgical Operations on Thursday, at One  
o'clock.

A Maternity Department, for the delivery of married lying-in women at  
their own homes, is established at the Hospital, under the superintendence of the  
Obstetric Physician.

Gentlemen becoming Pupils of the Hospital may attend all the Lectures,  
and the Medical and Surgical Practice necessary for those who desire to be-  
come Members of the Royal College of Surgeons, or Licentiates of the Society  
of Apothecaries, on paying Forty Guineas at the commencement of the first  
year, Forty Guineas at the commencement of the second year, and Twelve  
Guineas at the commencement of the third year.

The payment for the year will admit the Pupil to all the Lectures, and to  
the Hospital Practice required, for that year only.

Special entries to Hospital Practice, or to any separate Course of Lectures,  
may be made as heretofore.

Some of the Lecturers and other gentlemen connected with the Hospital  
receive Students to reside with them.

Further information may be obtained from the Secretary of the Hospital, or  
from Mr. Hammerton, the Apothecary of the Hospital, who is authorized to  
enter the names of Students.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.

N.B. A Chemical Laboratory on the Premises.

## Guy's, 1854-5.—The Medical Session

commences in October. The Introductory Address will be given by JOHN BIRKETT, Esq., on Monday, the 2nd of October, at Two o'clock. Gentlemen desirous of becoming Students must produce satisfactory testimony as to their education and conduct. They are required to pay £40 for the first year, £40 for the second year, and £20 for every succeeding year of attendance; or £100 in one payment entitles a Student to a perpetual Ticket. Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents, and Dressers in the Eye Ward, are selected according to merit from those Students who have attended a second year. Mr. Stocker, Apothecary to Guy's Hospital, will enter Students, and give any further information required.

Guy's Hospital, August 22nd, 1854.

EAST INDIA HOUSE, August 9th, 1854.

## Notice is hereby given, that the

annexed CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the Affairs of India, under the provisions of the Act 16 and 17 Vict., cap. 95, sec. 38.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons; they must, however, be between twenty-two and twenty-eight years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration pursuant to the Act 5th and 6th William IV., cap. 63.
2. A diploma in surgery or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.
3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least, on an average, 100 in-patients, or of having attended one course of lectures of six months on the practice of physic and clinical instruction for twelve months.
4. A certificate of having attended for three months the practical instruction, given at one of the public asylums for the treatment of the insane.
5. A certificate of having attended for three months one of the institutions, or wards of a hospital, especially devoted to the treatment of ophthalmic disease.
6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.
7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination, to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.
2. Medicine, including the diseases of women and children, therapeutics, pharmacy, and hygiene.
3. Anatomy and physiology, including comparative anatomy.
4. Natural history, including botany and zoology.

The examination will be conducted:—

1. By means of written questions and answers.
2. By object examinations and experiments, when the subject admits of such tests.
3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.
4. By *visu et cœcæ* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's service.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Asylum also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information, if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MEYVILL, Secretary.

Mr. G. Hind, F.R.C.S., will resume his DEMONSTRATIONS on the morning of the 16th of September; at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## Apothecaries' Hall—College of Surgeons.

Dr. STEGGALL continues to assist gentlemen in their studies, preparatory to Examination at the Royal College of Physicians, College of Surgeons, Apothecaries' Hall, St. Andrew's, Aberdeen, &c., either in class or separately.—For terms, apply before One, and after Three o'clock, daily, at 2, Southampton-street, Bloomsbury-square.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.R.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships, which will per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

June, 1854.

## Loughborough Dispensary.—

Wanted, a RESIDENT HOUSE-SURGEON and APOTHECARY to the above Institution. He must be a Member of the Royal College of Surgeons, and Licentiate of the Apothecaries' Company. The Salary is £200 per annum, with furnished apartments for a single man, coals, candles, and attendance. A Compounder of Medicines is provided at the expense of the Institution.—Testimonials, directed to Mr. Brock, Baxter-gate, Loughborough, to be sent in on or before the 2nd of September next.

RICHARD NICKELSON, Loughborough.

## The General Hospital, Birmingham.

There is a Vacancy in this Hospital for a RESIDENT PUPIL, and there will be another Vacancy in the month of October next. The Hospital contains 220 beds, is recognised by the different Examining Boards, and from its position in one of the most extensive and populous manufacturing towns in England presents unusual advantages for the Student to acquire a sound knowledge of his Profession in all its branches. The terms may be known on application to the Secretary, at the Hospital.

26th August, 1854. WILLIAM R. HUGHES, Secretary.

### TO THE MEDICAL PROFESSION.

## Hanwell Lunatic Asylum.—A

Vacancy has occurred in the Office of RESIDENT MEDICAL OFFICER of the Female Department of the Middlesex County Pauper Lunatic Asylum at Hanwell; and gentlemen desirous to become Candidates for the appointment must be Fellows or Members of the Royal College of Surgeons, and Members or Licentiates of the Apothecaries' Company, married, and between thirty and fifty years of age. The salary will be £300 per annum, with board, including coals and candles, and residence at the Asylum.

Candidates are requested to send in testimonials, addressed to the Committee of Visitors of the Hanwell Lunatic Asylum, on or before the 2nd of October next, under cover to be sent to the Secretary, at the Asylum, where information as to the duties to be performed may be obtained; and they must personally sign the Certificate of William, at the Sessions House at Hanwell, on Friday, the 13th day of October, at Eleven o'clock precisely, on which day the Election will take place.

CHARLES WRIGHT, Clerk to the Visitors.

Dated this 24th of August, 1854.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUMMINGS, 12, John-street, Adelphi, London.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,  
14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Practitioner, a DISPENSER, to reside in the house. A liberal salary and gentlemanly treatment are offered in return for thoroughly efficient services.—Apply to Messrs. Taylor Brothers, 4, Vere-street, Cavendish-square.

**A Surgeon, having retired into**  
a private practice, wishes to Dispose of a handsomely fitted-up SHOP, well stocked with Drugs. Price £35.—Address, Alpha, 46, Mornington-place, Hampstead-road.

**A Gentleman, who has matriculated**  
at the London University and Apothecaries' Hall, wishes to assist a Practitioner during the hours not required for his hospital studies, in consideration of board and lodging.—Apply to Mr. Monson Hills, Guy's Hospital.

**A Gentleman, possessing both quali-**  
fications, is desirous of entering into an engagement with a General Practitioner in the country as Visiting ASSISTANT. The highest references can be given.—Address, X. Y., Post-office, Ipswich, Suffolk.

**To be Disposed of, for a moderate**  
premium, an unopposed Country PRACTICE, with appointments of about £100 per annum.—Address, X. Y. Z., Mr. Heath's, 25, Great George's-place, Liverpool.

**A Young married Man, having**  
walked the hospitals at Newcastle and Edinburgh, is wishful to engage as an Out-door Visiting and Dispensing ASSISTANT.—Address to J. A., Post-office, Newcastle-on-Tyne.

**An Assistant is immediately wanted**  
by a Surgeon in Birmingham to Dispense and occasionally Visit and attend Midwifery.—Address, stating age, terms, qualifications, &c. &c., to L. A. C., Post-office, Dentend, Birmingham.

**A Medical Gentleman, within a few**  
miles of London, has a Vacancy for a PUPIL, whose professional education he would superintend, and who would have the advantage of a Union Practice.—Address, M. Messrs. Corbyn and Co., 300, Holborn.

**Wanted, by a Gentleman, M.R.C.S.**  
and L.S.A., a Situation as Visiting ASSISTANT. A large town would be preferred. Unexceptionable references as to professional and moral character can be given.—Address, T. H. M., Messrs. B. Moxon and Sons, 17, Church-lane, Hull.

**A Second-year's Student will, on the**  
1st of October, be open to an Engagement as Visiting and Dispensing ASSISTANT in the Country, where a comfortable home and good opportunity of seeing practice would be afforded. Salary no object.—Address, R. M. E., Middlesex Hospital.

**Wanted, by a Surgeon in the**  
Country, an Out-door Visiting and Dispensing ASSISTANT, (married preferred,) with at least one qualification.—Address, prepaid, stating terms, age, &c., to Mr. L., at Mr. Woodwell's, 62, Berners-street, Oxford-street, London.

MEDICAL.

**Wanted, by the Advertiser, married,**  
and thirty-three years of age, an Out-door SITUATION in some Provincial Town, where he would be allowed to attend Lectures; has had many years' experience as an Assistant, and can give good references. A small remuneration only expected.—Address, L. C., Mr. Woodwell's, 62, Berners-street, Oxford-street, London.

TO STUDENTS OF ST. BARTHOLOMEW'S HOSPITAL.

**Mr. Harvey Ludlow, 27, Charter-**  
house-square, receives into his house a LIMITED NUMBER of GENTLEMEN, whose Studies he undertakes to superintend, and who will experience under his roof the advantages of a comfortable home, situated in close proximity to the Hospital.—For particulars respecting terms apply, personally or by letter, to Mr. Henry Ludlow, 27, Charter-house-square.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**  
and Referee, in offering his services (a Profession, taken leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

MEDICAL.

**London.—A Practice and Retail**  
(with residence very eligibly situated near the Clubs) is to be Disposed of immediately, in consequence of the death of the Proprietor, who conducted it for the last twelve years. The opportunity will be found eligible for obtaining an extensive and lucrative Practice.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

**Wanted, an Assistant, to Visit, Dis-**  
pense, and attend Midwifery.—Apply, stating age and salary required, to A. Z., Post-office, Saumundham, Suffolk.

**Assistant.—Required, an In-door**  
Assistant, M.R.C.S.; the most satisfactory reference expected as to moral character and capability. A knowledge of Midwifery essential. Salary, £45.—Address, L., care of Messrs. Gale, Baker, Warde, and Oldfield, Wholesale Druggists, Bouverie-street, Fleet-street.

**Wanted, in a large Metropolitan**  
Private Lunatic Asylum, a legally-qualified MEDICAL ASSISTANT. Candidates must be unmarried, and not more than thirty years of age. Salary, £50 per Annum. Applications, by letter, to be addressed to A. B., care of Dr. Robertson, Assembly-row, Mill-end.

**A Gentleman of eight years' practical**  
experience in the Profession, is desirous of forming a permanent Engagement as Assistant to a Surgeon in London, where arrangements might be made for attending Lectures, &c., at one of the West-end Hospitals. The highest testimonials at command.—Address, J. F., care of Mr. Burfield, Chemist, 100, Strand.

**Wanted, by an M.R.C.S. Eng.,**  
L.A.C., aged Twenty-five, who has had considerable experience in his Profession, a permanent Situation as Out-door ASSISTANT to a General Practitioner. A liberal salary required. For testimonials and references, and stating terms, address A. O. Y., THE LANCET Office, 423, Strand, London. London or a large county town preferred.

MEDICAL.

**For Disposal, a well-established**  
GENERAL PRACTICE, in a small railway town situate in the south of Yorkshire. Such an opportunity seldom offers for the safe transfer of £350 to £400 per annum.—Address, A. Z., Messrs. Butterfield and Clark, Wholesale Druggists, York.

**Partnership.—Wanted, by a gentle-**  
man possessing the double qualification, a SHARE in a PRACTICE, situated in the suburbs, or within an easy distance from London by rail; the Share to be not less than £300 or £400 per annum.—Address, M. Messrs. Knight and Foster, 6, Eastcheap.

**Partnership.—Wanted immediately,**  
in consequence of the illness of the proprietor, an active PARTNER in a GENERAL PRACTICE, established for twenty-five years, and producing, with appointments, £800 a year. The gentleman should be unmarried, and it would be much preferred that he should reside in apartments furnished for him in the house of the principal, and board with the family. The locality of the Practice is chiefly within a thriving city of 30,000 inhabitants, and it is capable of considerable extension.—Address, by letter only, D. J. M., 81, Lombard-street, City.

TO PHYSICIANS OR CONSULTING-SURGEONS COMMENCING BUSINESS IN LONDON.

**Messrs. Trollope and Sons have di-**  
rections to LET on LEASE a desirable RESIDENCE in Spring-gardens, for Thirty Years in the occupation of a Physician, who is retiring from business.—Apply to Messrs. Trollope and Sons, House Agents, Parliament-street. Back-entrance, 6, Cockspur-street.

**House and Shop to Let, at the West-**  
end, suitable for a General Practitioner. Rent £80; taxes low; no Premium, (the owner being ill, desires to leave at once), but the Chemist's Fixtures and Drugs to be taken at a Valuation.—Apply to Mr. J. E. Puddick, Valuer, 314A, Oxford-street.

TO MEDICAL STUDENTS AND OTHERS.

**Apartment furnished, with attend-**  
ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex University College, Charing-cross, and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

## Oleum Jecoris Aselli.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**M**ESSRS. ANSAR, HARFORD, & Co., have the honour of informing the Medical Profession and the Public generally, that they have opened an Establishment at No. 77, STRAND, for the exclusive Sale of DR. DE JONGH'S COD-LIVER OIL, for which they have been appointed Sole Agents and Consignees in the United Kingdom and the British Possessions.

Whilst the marvellous effects of the Cod-liver Oil, and its superiority over every other remedy for the cure of Consumption, Asthma, Gout, Chronic Rheumatism, and all kinds of Scrofulous Complaints, are now too generally admitted by the most eminent practitioners to require any detailed exposition, a brief statement of the claims to public support of the peculiar preparation now first introduced into this country will naturally be looked for.

DR. DE JONGH, a Dutch physician of eminence, has, as it were, exclusively devoted himself, for upwards of fourteen years, to a series of scientific researches into the nature and properties of this inestimable medicine. His works, recording the results of his investigations, have been translated into most of the European languages; by universal admission, they are regarded by the Faculty as the standard authority upon the subject, and in addition to having obtained the spontaneous approval and the most flattering testimonials from some of the most eminent medical men and scientific chemists in Europe, including the names of BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, and FOUQUIER, they have been rewarded by his Majesty Leopold I., the King of the Belgians, with the large Gold Medal of Merit, and by his Majesty William II., the King of the Netherlands, with a Silver Medal, specially struck for the purpose.

DR. DE JONGH'S elaborate researches and practical observations have demonstrated the superior efficacy of the Light-brown Oil, which effects a cure in a much shorter time than the pale oil. His series of therapeutical experiments with the various kinds of Cod-liver Oil have invariably proved the light-brown to contain iodine, phosphate of chalk, volatile acid, and the elements of the bile,—imparting the colour to the Oil, and deemed amongst its most active and essential principles,—in larger quantities than the pale oil manufactured in England and Newfoundland, which by its mode of preparation is in a great measure deprived of these active principles.

So strikingly beneficial have been the results attending the use of the preparation to which DR. DE JONGH has awarded the preference, that in Holland and Germany, where this remedy has been prescribed for upwards of thirty years by the Faculty, for Rheumatism, Gout, and Scrofulous Diseases, and of late years with signal success for Consumption, the pale, or rather the yellow oil, in favour of which, owing to its long use and to its being considered in a very trifling degree more palatable, there existed a deep-rooted prejudice, is at present almost totally disused. In France and Italy, where its introduction is of more recent date, DR. DE JONGH'S Oil is already held in the highest repute amongst the most distinguished practitioners, and is in most extensive demand on the part of the public.

From every cask of Cod-liver Oil prepared according to DR. DE JONGH'S directions, a sample is taken, and submitted by him to the most careful chemical analysis prior to its being exposed for sale. By this means, the Faculty and the Public in general may rest assured of being able to procure the purest and most efficacious Cod-liver Oil; and this medicine, no longer exposed to the influence of accidental causes or foreign ingredients, capable of destroying, altering, or paralyzing its effects, will be able to assert its full rights, and maintain the ground it has so deservedly acquired.

A pamphlet, by DR. DE JONGH, with detailed remarks upon the superiority of the light-brown oil, directions for its use, cases in which it has been prescribed with the greatest effect, and testimonials, will be forwarded to medical practitioners gratis on application. The bottles containing the oil are labelled, and bear DR. DE JONGH'S stamp and signature, to which particular attention is requested. Directions for use accompany every bottle.

*The following are selected from some of the leading Medical and Scientific Testimonials in favour of*

**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod-liver Oil.

You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state ensure you the gratitude of every one who stands in need of its use.

I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

(Signed)

**Dr. JUSTUS LIEBIG.**

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the author of the best analysis and investigations into the properties of this Oil should himself be the purveyor of this important medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to

your application. The Oil which you gave me was of the very finest quality; whether considered with reference to its colour, flavour, or chemical properties and I am satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

**JONATHAN PEREIRA.**

"Finsbury-square, London, April 16, 1851.

"To Dr. de Jongh."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty

Louis Philippe, &c. &c.

"DEAR SIR AND HONOURED COLLEAGUE,—I must begin by thanking you for your polite attention in sending me your works, and must furthermore openly acknowledge that you have rendered an eminent service to science, by acquainting practitioners with the cause of the frequent irregularity in the effects of the Cod-liver Oil, and directing their attention to a proper choice. You have thereby preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases. It is therefore with the greatest pleasure that I pay my tribute of well-merited praise to the successful efforts of the learned physician and chemist, whose researches after truth have cost him so many sacrifices, and who has shown us the way of rendering highly effectual the administration of one of the most powerful medicines we are acquainted with.

"Accept the assurance, most honoured colleague, of my sincere expression of gratitude and regard.

(Signed)

**FOUQUIER.**

"Paris, Nov. 12, 1847.

"To Dr. de Jongh at the Hague."

"Physician to the King."
